For more than twenty five years, this community has endured the prospect of an additional runway. Massport cites that the Project will provide improvements to alleviate the aircraft arrival and departure delay problem at Logan Airport. Yet in the very same breath, they talk about how in order to meet the projected demand of passengers at Logan, a new runway will be necessary. Massport can not have it both ways. Either it is efficiency for today's Logan or expansion of tomorrow's. Either way, the cumulative environmental impacts associated with Logan's expansion are too great for this community to handle.

Massport claims that alternatives have been considered including a Second Major Airport (SMA). However, since the time frame from planning to construction would have taken ten to fifteen years, such an alternative was not feasible. However, that decision was made back in 1989. Had there been a decision to really work towards development of an SMA, we might not have faced this problem today and could be well on our way to much needed relief for our communities. The problem is not that an SMA was not feasible, but that Massport was focused and committed to building a runway at Logan. 236.2

The communities opposing construction of a new runway at Logan have spoken in a unified and loud voice. They do not want to see another runway at Logan Airport and believe that our communities have shouldered enough of the burden. As Massport trudges through the environmental review process with it's army of consultants, the communities do their best to organize against a new Mr.

runway. However, as many of us already know, without the resources to counter Massport's position, this challenge will be difficult if not impossible.

As the Commonwealth's regulatory agency responsible for protecting the environmental rights of our community, I ask that you assess this project cautiously and carefully and consider the burden that this community will be once again asked to face.

Very truly yours,

Richard C. Lynds, Esq.

236.1	Regional Transportation	Regional Airports	The success of airports like T.F. Green in Providence Rhode Island and Manchester Airport in New Hampshire are testament that regional commuters will use airports other than Logan to avoid delays, traffic, and to save money.	Chapter 2 of the Supplemental DEIS/FEIR provides a discussion of the specific role played by the regional transportation alternatives and steps that Massport has taken to foster use of these alternatives. Massport has long recognized and has been a proponent of options to Logan Airport. Together with the regional airports, Massport has implemented a regional strategy to enhance the use of options to Logan Airport. In the Airside Project Draft EIS/EIR, Massport identified up to 7.3 million annual passengers that could be absorbed by regional alternatives that include use of T.F. Green/Providence, Manchester and Worcester Regional airports, as well as the new high-speed rail to New York. In the Supplemental DEIS/FEIR, Massport recognizes that these developments will slow Logan Airport's passenger traffic growth. Logan Airport may not achieve the 37.5 million passenger forecasts until after 2010, but rather closer to 2015, and the 45 million passenger forecasts may not be achieved until after 2020. While regional alternatives can play an important role in reducing the rate of future traffic growth at Logan Airport, they do not address Logan Airport's inability to efficiently accommodate current levels of demand during northwest wind conditions. Runway 14/32, which is designed to correct the problem with Logan Airport's layout, is necessary to correct this deficiency and provides clear benefits at current aircraft traffic levels. These benefits will only increase in the future, even as developments at the regional airports act to reduce the rate of future growth at Logan Airport. LETTER 237

Submitted 4/8/99 by:
William Manning
1 Webster Ave.
East Boston MA 02128

Gentlemen,

I live and work in East Boston and so the issue of runway/airport expansion has twice the importance for me as it might for some people

I want to express my opposition to Massport's proposed plans at Logan for a variety of reasons.

...

Plan Violates Commitments

The Massport proposals violate commitments made to Logan-impacted neighborhoods not to expand the airports physical size or runway configuration. These commitments were the result of a community planning process that got those concessions for not opposing other improvements such as the third harbor tunnel.

237.1

These understandings are referred to in Massport's 1991 General Environmental Impact Review. They were confirmed in recent newspaper articles that quoted a former state Secretary of Transportation and a former executive director of Massport, both of whom knew the wording of the agreement and the intent of those words.

[See attached document]

Equitable Distribution Of Noise

Another rational for Massport's proposal for a new runway is for the equitable distribution of noise. Once again, however, the noise would only be distributed among the same neighborhoods that have **always** had to bear the environmental burden of an expanding airport.

That must stop.

237.2

To distribute noise equitably would mean to site jet service closer to where the passengers who benefit from that service begin and end their trips. With over 55% of Logan's passengers coming from the Route 128 /495 belts, that

II. PLANNED ACTIVITIES

INTRODUCTION

Massport undertakes a capital planning process annually to determine those projects required to maintain and improve the airport. In addition, Massport performs long-term planning studies of current and anticipated future operations at Logan Airport to determine what capital projects are necessary to serve the region's demands. Such studies are documented in the Draft Generic Environmental Impact Report (GEIR) (December 1991).

Based on these studies, Massport has reviewed the present facilities and the need for their modernization. These reviews indicate the need for a variety of physical improvements at Logan Airport including renovation of aging or substandard terminal facilities, enhancement of ground transportation access, consolidation of parking facilities, and improvement of airfield support systems. This chapter describes the status of the modernization program. It explains the principles guiding the development and implementation of the program and outlines the environmental review process anticipated for the individual projects. This Final GEIR does not initiate Massachusetts Environmental Policy Act (MEPA) review of any project described; Massport has prepared and will continue to prepare project-specific Environmental Notification Forms (ENFs), as appropriate.

Logan Airport currently serves approximately 6,600 peak hour passengers and 23 million annual passengers. Modernization planning has been based on a potential future scenario whereby airport facilities and infrastructure would serve nearly twice as many passengers, 12,400 at peak hour and 45 million annually.

PLANNING OBJECTIVES FOR LOGAN AIRPORT

The current planning for the terminal area started with the completion of the 1981 Land Use Plan for Logan Airport. This plan created a series of land use zones for the airport, defining development zones for terminal, cargo facilities, and other airport uses. These recommendations for the distribution of airport land uses have guided most subsequent decisions for the use and development of the airport terminal area.

The publication in 1983 of the I-90/I-93 Draft Environmental Impact Statement by the Massachusetts Highway Department assessed a Third Harbor Tunnel

and roadway interchange to Logan Airport. In response to this project, Massport began the Cross Harbor and Regional Transportation Study to examine alternatives for the new tunnel and interchange, to examine future development patterns at Logan Airport, and to examine options to increase high-occupancy vehicle (HOV) use as a means of access to Logan Airport.

The options reviewed included the addition of new unit terminals, an extension of the finger pier/concourse design around the perimeter of the present terminal area, a row of parallel concourses served by people-movers, and a centralized airport. The centralized plan would allow passengers to arrive and depart from a central facility via connections to the present unit terminals.

After extensive review of these options, Massport rejected them as infeasible because of excessive costs, inadequate design, or construction phasing problems. Instead, Massport chose to use the existing facilities where possible.

As Massport approached the 1990s, four specific factors caused Massport to consider particular actions to modernize Logan Airport: the inevitable aging of airport infrastructure and terminals; the anticipated construction of the Third Harbor Tunnel; a shift by the airlines to greater use of higher passenger capacity, widebody aircraft; and continued increases in aviation demand in New England. As a result, Massport initiated modernization studies for Logan Airport aimed at identifying capital improvements that would increase operational efficiency and minimize environmental impacts. The aim of these studies was to:

- Retain present airport size, physical boundaries, runways, and runway configurations;
- Develop a balanced allocation of facilities to provide for all types of airport land uses;
- Preserve future flexibility to adapt to changing conditions at the airport and within the aviation industry; and
- Incorporate the recommendations of prior studies and plans and ongoing articulated policy commitments into the modernization program.

Over the past two years, Massport has undertaken comprehensive planning and programming studies to define each of the key projects needed to modernize Logan Airport. Architectural studies also were completed to establish design guidelines addressing aesthetics, passenger convenience, and functionality of future projects at Logan Airport. These projects are now defined in enough detail to initiate design and environmental review.

Concurrent with planning for major facilities is Massport's ongoing capital planning and budgeting process which includes many small projects such as repairs, access improvements, landscaping, minor alterations, equipment purchase and installation, design and environmental studies and mitigation measures, and data gathering and analysis efforts.

VI. MITIGATION

INTRODUCTION

Massport has worked over the years to mitigate the environmental impacts associated with Logan Airport activities. Massport has been a consistent proponent of innovative mitigation measures to improve the quality of life in neighboring communities. The comprehensive review of long-term impacts in this Generic Environmental Impact Review (GEIR) is aimed at establishing additional effective mitigation procedures for the future operation of Logan Airport.

In 1987, Massport initiated the Logan Growth and Impact Control (LOGIC) Study to determine whether it was possible to keep Logan Airport impacts at or below the level of impacts in 1987 for various future operational scenarios. Phase I and Phase II of the LOGIC Study demonstrate that, with appropriate mitigation, the Logan Airport-related impacts can be kept at or below the 1987 Baseline Conditions for scenarios involving 45 million annual passengers. This is the passenger level assumed to occur in 2010 (in the LOGIC Study Phase II) or in 2024 under the more moderate expectations of Massport technical staff.

As a result of the LOGIC Study, Massport proposes as its overall mitigation goal to keep impacts at or below the 1987 Baseline Conditions. The premise of limiting impacts at levels at or below those experienced in 1987 is the starting point for determining specific mitigation commitments. In support of this goal, Massport will continue its current mitigation policies and further will implement the specific mitigation actions described below. Moreover, Massport proposes to monitor regularly the impacts associated with airport operations in order to measure impacts and to determine the effectiveness of the mitigation program. Massport proposes to file annual updates regarding ground transportation, noise, and air quality, and proposes to file a GEIR every five years. These regular reports will demonstrate whether Massport is achieving its goal and will monitor the effectiveness of the mitigation measures proposed in this Final GEIR. Subsequent GEIRs will describe actual passenger demand growth, future passenger forecasts, impact assessments, and additional mitigation proposals/commitments.

This chapter summarizes the mitigation actions which Massport will undertake. In addition, ongoing mitigation measures are described as well as additional mitigation measures to be studied for their feasibility. Detailed discussion regarding each technical study area can be found in Chapter IV, Environmental Issues, and Chapter V, LOGIC Phase II Findings.

POLICY FRAMEWORK

The effects of Logan Airport's activities upon neighboring residential areas has led to increasing community participation in the airport planning process. Discussion between the community and Massport about the future of the airport resulted in the development and adoption of the 1976 Logan Airport Master Plan, which established policies on physical growth and development at the airport. Guidelines for limiting future growth in land area were established along with other policies committing Massport to be more sensitive to community and environmental concerns. While the policies in the 1976 Master Plan were intended to guide decisions for Logan Airport over the subsequent five- to ten-year period, they continue to guide planning for Logan Airport and have helped form the framework for subsequent mitigation initiatives such as the Noise Rules, the school and residential soundproofing programs, and the Preferential Runway Advisory System, among others.

Since the publication of the 1976 Master Plan, passenger demand at Logan Airport has doubled.[1,2] However, this increase in aviation traffic has been and will continue to be accommodated without expansion of overall runway capacity or airport physical boundaries. Massport has initiated a major new project designed to improve the airport's neighborhood edge and reduce the airport's impact on the community.

Massport is committed to a pro-active approach to control the impacts of the inevitable growth in passenger demand. Massport will continue to follow the major policy commitments summarized within this chapter including the 1976 Logan Airport Master Plan; the Bird Island Flats Agreement; the Massport Environmental, Health, and Safety Policy; and the provision of technical resources to community groups.

1976 Logan Airport Master Plan

With the adoption of the Master Plan in 1976, Massport established a policy framework for airport planning. In the introduction to the Master Plan, Massport presented its objective of balancing regional transportation and economic needs with the needs of Logan Airport's neighbors. The Master Plan has provided guidance to Massport since its adoption by the Board, and Massport will continue to follow its guidelines in the future.

The Master Plan addressed six major policy areas: growth, noise, land use, ground access, the planning process, and affirmative action. In each of these areas, the Master Plan identified proposals to be studied and adopted. Among the notable actions which resulted from the Master Plan are the Noise Abatement Program including a program for soundproofing schools and residences; the divestiture of residential properties in East Boston; the Neptune Road relocation program; ground access service initiatives; and an active and continuing community participation program.

Logan Growth and Impact Control (LOGIC) Study, Phase I, prepared for Massport by Frederic R. Harris, Inc. June 1991.

LETTER 238

Webster Avenue 1

Boston, MA 02129 East

21, 1999 April

Arthur Pugsley
MEPA
100 Cambridge St.
Boston, MA 02128

Pugsley,

I want to strongly oppose Massport's attempt at squeezing another runway into Logan Airport. It is environmentally unsound, a violation of environmental justice guidelines, and an attempt to undo agreements not to expand Logan that were made to surrounding communities in the early '90s in exchange for previous air and landside improvements that included the third harbor tunnel. 238.1

From an environmental standpoint, a projected reduction in noise that is claimed by Massport through the addition of the new runway can't be guaranteed because there is no guarantee of unidirectional use of 14/32. The runway will only attract new air traffic, just as new highways always attract new auto traffic, and will add to the noise and pollution in the area.

Runway 14/32 will clearly have an adverse impact on yet another area of East Boston, the Jeffries Point neighbor. With flights going out over the water on take-off, exhaust and jet noise will blow directly back into that heavily populated community and ruin the ambiance of Piers Park, built at great expense and intended as a neighborhood amenity. That park and the surround neighborhood will get the full brunt of gets taking off and landing if 14/32 is allowed to be constructed. 238.2

There is too great a reliance on Logan as it is, and additional expansion of facilities and capacity will only make it worse. Massport's projection of future traffic over the next 20 years will make East Boston, Winthrop and other hard-hit communities. unlivable. Their projected "conservative" estimate of so-called equivalent jet operations, furthermore, is expected to grow by 50% over the next decade. 238.3

The benefits of further conversion to Stage 3 aircraft, furthermore, are grossly overstated vis a vis future noise levels at Logan. And federal policy also establishes that this project must be considered and evaluated as stimulating growth in aircraft operations at Logan, so Massport's claims to the contrary are ludicrous -- as are its delay models which are in conflict h the FAA's own statistics. 238.4 238.5 238.6

e serious is the fact that Massport, in violation of the National Environmental Policy Act, has not explored all the alternatives available to it, including the development of a new major airport, use of Hanscom field, and peak pricing alternatives. 238.7

Massport is continuing its history of bad faith with the community and distorting the truth in order to place its revenue goals ahead of the well-being of the neighborhoods it has often treated with contempt over the years. That treatment is in stark constrast to its solicitousness toward the communities that surround Hanscom Field, in the 128/495 corridors, who make up more than half of Logan's Massachusetts passengers.

I urge you out of concern for the air we breath and what remains of our quality of life, do not grant Massport the certification it seeks and which it so richly doesn't deserve.

Sincerely,

William J. Manning

238.1	General Opposition		[The Logan expansion] is environmentally unsound, a violation of environmental justice guidelines, and an attempt to undo agreements not to expand Logan that were made to surrounding communities in the early '90s in exchange for previous air and landside improvements that included the third harbor tunnel.	Massport disagrees with this statement.
238.2	Alternatives	Runway 14/32	Runway 14/32 will clearly have an adverse impact on yet another area of East Boston, the Jeffries Point neighbor…exhaust and jet noise will blow directly back into that heavily populated community.	The dispersion modeling results indicate that concentrations of pollutants will be below the NAAQS at all times. The Supplemental DEIS/FEIR reports worst-case conditions, meaning air quality will be better than this under almost all conditions. A full year of actual weather data was used to conduct the dispersion analysis. In summary, actual wind conditions have been used to model pollutant concentrations at Jeffries Point, where no violations of the NAAQS were projected. Furthermore, Runway 14/32 will primarily be used for arrivals. Also it will not increase the number of operations during northwest winds, but will allow projected operations to be accommodated with fewer delays. One-hour VOC concentrations (used as an indicator of odor) increase only slightly at Jeffries Point with the Preferred Alternative, when compared to the No Action Alternative. The predicted increase is so small that changes in odor will remain imperceptible, as measured against the No Action Alternative. Concentrations decrease at all other receptors with the Preferred Alternative. The proposed projects evaluated under each of the alternatives are located on the existing airfield. Implementation of any of the proposed projects will not physically change the urban characteristics or the design of the built environment within adjacent communities when compared to the No-Action Alternative. Off-airport noise impacts from the Preferred Alternative are discussed in Section 6.2 of the Supplemental DEIS/FEIR.

Code	Topic 1	Topic 2	Comment	Response
238.3	Ground Transportation	Access to Logan	Massport's projection of future traffic over the next 20 years will make East Boston, Winthrop and other hard-hit communities. unlivable.[sic] Their projected "conservative" estimate of so-called equivalent jet operations, furthermore, is expected to grow by 50% over the next decade.	In 1998, 77 percent of Logan Airport's jet traffic affected communities to the north and south of the airport—East Boston, Winthrop, Revere, parts of South Boston, Dorchester, Quincy, Milton, and Braintree. Without Runway 14/32, as much as 88 percent of Logan Airport's aircraft operations will overfly these communities when Logan Airport reaches 37.5 million passengers. Construction of Runway 14/32 will allow a more balanced geographic distribution of aircraft operations over populated areas, will increase the number of over-water operations, and will reduce noise exposure for close-in communities. Furthermore, the Supplemental DEIS/FEIR also demonstrates the more equitable balance of noise impacts among communities surrounding Logan Airport that can be achieved with the Preferred Alternative as opposed to the imbalance that occurs today no would occur in the future if no action is taken. PRAS noise goals are based on the fact that DNL levels above 75 dB are considered unacceptable for residential land use and that DNL levels above 70 dB are also excessively high and should be reduced if feasible. PRAS recommendations are thus designed to shift operations off of runways where these high levels still exist – primarily in Winthrop and to the north of Logan Airport in East Boston and Revere.
238.4	Noise	Hushkitted Aircraft	The benefits of further conversion to Stage 3 aircraft, furthermore, are grossly overstated vis a vis future noise levels at Logan.	The study does not overstate the benefit of further conversion to Stage 3 aircraft on future noise levels. It uses two fleet scenarios in which almost all aircraft meet Stage 3 requirements, either as hushkitted Stage 2 aircraft or new Stage 3 aircraft, and three fleet scenarios in which all the aircraft meet Stage 3 requirements. Most of the aircraft are new high-bypass, engine-powered Stage 3 aircraft. Many of the hushkitted aircraft have been retired.
238.5	Environmental Review Process	FAA/NEPA	... federal policy also establishes that this project must be considered and evaluated as stimulating growth in aircraft operations at Logan, so Massport's claims to the contrary are ludicrous.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR respond to federal and state scoping directives and applicable FAA environmental orders and all other NEPA and MEPA requirements, and provide appropriate analytical content for assessing alternatives.

Code	Topic 1	Topic 2	Comment	Response
238.6	Delay	Model	Massport's delay models are in conflict with the FAA's own statistics.	Refer to Section 4.4 of the Supplemental DEIS/FEIR for a discussion on the estimation and modeling of flight delays. It includes a description of FAA and U.S. DOT delay measures and their limitations, an explanation of computer models for estimating flight delays, and historical data on delays at Logan Airport and other major United States airports. The methodology used for the Airside Project includes the effects of constraints at Logan Airport, and produces lower delay estimates than FAA modeling. The FAA approved all the models, which have been validated in previously published studies of Logan Airport. The FAA Technical Center was responsible for the capacity and delay results in the 1992 FAA Capacity Enhancement Report for Logan Airport that concluded the need for Runway 14/32, reduced minimums and taxiway improvements. The Technical Center simulated Logan Airport airfield operations with the RDSIM model and estimated that when activity reached 504,000 annual operations, total delay would exceed 260,000 hours per year. The Airside Project Draft EIS/EIS forecasts delays to increase to 157,500 hours per year when annual operations reach 510,000 with the 29M Low Fleet scenario. The Supplemental DEIS/FEIR compares the FAA Technical Center delay estimates in 1992 with those of the Logan Airside Project estimates. The FAA has concluded that the Airside delays represent "a plausible and conservative estimate...." The FAA consistently rates Logan Airport as one of the most delay prone airports in the United States Logan Airport's estimated annual delay hours are over five times the FAA's 20,000-hour threshold for a severely delayed airport.

Code	Topic 1	Topic 2	Comment	Response
238.7	Environmental Review Process	NEPA	Massport, in violation of the National Environmental Policy Act, has not explored all the alternatives available to it, including the development of a new major airport, use of Hanscom Field, and peak pricing alternatives.	In January 2000, in response to the FAA's review of the Draft EIS, the FAA called for preparation of a Supplemental Draft EIS to address specific issues identified by the FAA following input from a SDEIS Panel consisting of six persons. A second major airport is not a solution to the current delay and congestion problems at Logan Airport. The Proposed Project to reduce delay and enhance safety at Logan Airport must be implemented in the near term to address current and future operating conditions. The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR specifically considered the role of Hanscom Field in the analysis of regional alternatives. Hanscom Field, which serves as a general aviation reliever airport to Logan Airport, already accommodates a significant number of aircraft operations (183,000 operations in 1998). The Hanscom Field activity includes private, business, charter, and air taxi operations that might otherwise use Logan Airport. Since the Airside Project Draft EIS/EIR was filed, Shuttle America, a newly founded airline, began commercial scheduled operations at Hanscom Field, offering limited turboprop services to short-haul regional markets – Trenton, Buffalo, Hartford (discontinued), Wilmington, Delaware (discontinued), and Greensboro. Shuttle America is also conducting operations between Hanscom and New York LaGuardia Airport. While Massport supports commercial service at Hanscom Field consistent with its established policy (60-seat regulation), it believes that Hanscom Field will maintain its role as a major general aviation reliever, and that its geographic proximity to Logan, Worcester Regional and Manchester airports will prevent its development as a significant commercial airport. Additionally, commuter airlines serving Logan Airport are unlikely to move a significant number of flights from Logan Airport to Hanscom Field, since approximately 50 percent of passengers on Logan Airport's commuter flights connect to other Logan Airport flights. However, any new commercial service initiatives proposed for Hanscom Field shall be reviewed for consistency with the *Hanscom GEIR* (HGEIR), its Annual Updates, and applicable regulatory limitations, and shall be considered by the Hanscom Field Advisory Committee. Refer to Section 2.6 of the Supplemental DEIS/FEIR for a discussion of Hanscom Field. The environmental impacts of commercial services at Hanscom Field are summarized from the HGEIR and appear in Appendix B of the Supplemental DEIS/FEIR. Section 4.5 of the Supplemental DEIS/FEIR provides an updated discussion of PPP at Logan Airport and an analysis of the implications of an illustrative conceptual small community exemption program. PPP was included among the Airside Project alternatives to address delays caused by over-scheduling. The potential impact of PPP on the fleet mix at Logan Airport is discussed in Section 4.5.2 of the Supplemental DEIS/FEIR. Section 4.5.3 of the Supplemental DEIS/FEIR provides an analysis of a PPP Exemption program.

173 Lexington Street
East Boston, MA 02128

Mr. Robert Durand, Secretary
Executive Office of Environmental Affairs
100 Cambridge Street
Boston, MA 02202

LETTER 239

March 8, 1999

Dear Secretary Durand,

As a life long resident, environmental activist and homeowner in East Boston, I write to urge you to oppose Massport's proposed runway 14/32, which has very little to do with delay reduction and everything to do with expansion of capacity at Logan. According to Massport's MEPA EIS report, the runway would reduce delays only 20% of the time AND would be effective only until the year 2003, when delays at Logan will be *at or above* today's levels. The permanent environmental damage that would be inflicted on Boston residents cannot be justified by this short-sighted, ineffective proposal. 239.1

Because of increased flight operations on existing runways if 14/32 is built, residents of Boston and surrounding areas *who already bear an unfair portion* of the noise, air pollution and auto traffic caused by Logan will be permanently and dangerously impacted with triple the amount of planes passing over our homes. With 14/32, operations on runway 27 (impacting Roxbury, South Boston, the South End, Dorchester, Jamaica Plain, Roslindale, West Roxbury and Brookline) will increase from 18,000 to 56,495 annually. Operations on runway 33 (affecting East Boston, Chelsea, Charlestown, Revere, Somerville, Cambridge, Winthrop, Melrose) will increase from 6,082 to over 21,000 annually.

Massport's EIS report makes the case for a new runway at Logan, but doesn't mention <u>that every year since 1992, delays at Logan have gone down</u> or remained stable. This information is publicly available in the Federal Aviation Administration's 1998 ACE (Airport Enhancement Capacity) Report. The only reason that Massport can claim the Logan has a "delay problem," is because Massport chooses to use exceedingly high "maximum capacity" goals. The ideal number of planes that an airport handles per hour (Maximum Capacity) varies nationally from airport to airport and ranges from anywhere to 50 planes per hour to 150 planes per hour. The determination of maximum capacity goals depends on the location of an airport. 239.2

Obviously, airports such as Dallas or Denver, located on wide open, relatively unpopulated land can aim for higher maximum capacity numbers. Airports located in the middle of densely populated urban areas must accept the fact that because of environmental and health concerns, their maximum capacity will be lower than that of airports in non-urban areas. Massport claims to be number 5 in national airport delays (actually, according to the 1998 FAA ACE Report, they are number 7). In any case, the only reason they are able to claim that Logan is a "high delay" airport is because they aim for 120 planes per hour as their maximum capacity. If they set their goals to a more realistic 90 planes per hour (used in other urban airports), Logan would not have a serious delay problem.

Massport's EIS represents the interests of airlines and airport-related businesses, all of whom stand to make big profits if Logan's overall capacity is increased by runway 14/32. None of these groups care about the impact 14/32 will have on human beings, because none of them live in the impacted communties. The EIS does not take into account health impacts (Boston's inner city neighborhoods already have the highest asthma, emphysema and respiratory infection levels in the State - conditions greatly aggravated by plane and car fumes). The EIS does not take into consideration the environmental and quality of life issues of Boston's inner city residents. The EIS does not include the negative indemnity of real estate prices for the thousands of homes under the flight paths, nor the City's future lost tax revenues when what's left of Boston's middle class leave the area because they can no longer stand the persistent and excessive plane noise and fumes. These are serious concerns that demand your 239.3 239.4

attention. Please reject Massport's EIS, support the present court injunction against 14/32, and encourage Massport to seek alternative methods to handle projected air travel increases.

Massport should direct significantly more flights to Hanscom Airport located just 25 minutes from Boston and presently utilized at only a third of its capacity. Hanscom presently has the runway capacity to handle commercial commuter planes. Massport could redesignate Hanscom as a commercial commuter airport instead of an elitist "small corporate jet" airport, as it is now designated. By increasing air traffic at Hanscom, Worcester, Manchester and Providence to the maximum capacity possible, Massport can avoid future delays at Logan AND allow Boston residents to maintain some semblance of a healthy quality of life. 239.5

Another alternative which Massport has been unwilling to implement is Peak Hour Pricing, a demand management tool which is very successfully used in the hotel and tourism industry as well as the electric utility industry. For profit reasons, airlines prefer to increase capacity rather than manage demand. In a democratic society, profit motives must not overrule the well-being of that society's citizens. Massport has the regulatory power and political clout to become a national trail blazer in airport demand management and should at least give this tool a year long trial implementation before proposing band-aid solutions that cause extreme environmental danger and hardship for Boston residents. Even the Volpe National Transportation System Center, which works closely with the FAA, admits on their website that "the present and predicted demands on airports cannot be met by constructing additional runways". 239.6

I write to you as a fourth generation East Bostonian who would like to be able to raise my children in the community where my parents, grandparents and I grew up. My home is located under the Runway 33 flight path (but according to Massport's outdated noise contour lines, we do not qualify for sound proof windows). As I write this, a plane passes over my house every 2 minutes and I can't imagine what our lives will be like if the number of flights on runway 33 triples. Thank you for your attention to this critical issue.

Sincerely,

Regina Marchi

Code	Topic 1	Topic 2	Comment	Response
239.1	Analysis Assumptions/ Methodologies	Planning Period	According to Massport's MEPA EIS report, the runway would reduce delays only 20% of the time AND would be effective only until the year 2003, when delays at Logan will be at or above today's levels. The permanent environmental damage that would be inflicted on Boston residents cannot be justified by this short- sighted, ineffective proposal.	Based on simulation modeling, Logan Airport experienced 120,000 hours of runway-related delays in 1998. If no actions are taken, runway-related delays are forecast to grow as high as 333,000 hours under a 37.5M High Fleet scenario. The Preferred Alternative produces immediate and long-term benefits by lowering runway delays by 38,000 hours if it had been in place in 1998, and by as much as 94,000 hours in the future 37.5M High Fleet scenario. Because of the impact of the regional alternatives, the 37.5M High Fleet scenario is not expected to be achieved until 2015. The sooner airside efficiencies are implemented; the more benefits will accrue over time. Section 4.6 of the Supplemental DEIS/FEIR shows that delay reduction benefits increase over time as traffic levels increase.
239.2	Delay	Model	Massport's EIS report makes the case for a new runway at Logan, but doesn't mention that every year since 1992, delays at Logan have gone down or remained stable. ...Federal Aviation Administration's 1998 ACE (Airport Enhancement Capacity) Report. The only reason that Massport can claim the Logan has a "delay problem," is because Massport chooses to use exceedingly high "maximum capacity" goals.	Logan Airport flight delays, as measured by the FAA, did decline between 1993 and 1997. Nevertheless, the same data show that Logan Airport was consistently ranked as one of the nation's most delayed airports throughout this period. In 1998, delayed flights at Logan Airport, as reported by the FAA increased by more than 30 percent and continued to increase in 2000. In 2000, Logan was the second most delayed airport in the United States for arrivals. This represents the worst rank in Logan Airport's history. There are three reasons for the decline in delays between 1993 and 1997. First, in 1997, the number of hourly scheduled flights was less than Logan Airport's normal operating capacity of 120 flights per hour, unlike 1993, when airlines scheduled flights well beyond Logan Airport's hourly capacity. Second, Logan Airport's hourly demand profile is flatter than it was in 1993. Airlines are spreading scheduled flights throughout the day taking advantage of Logan Airport's off-peak hours (*e.g.*, 10 AM to 1 PM). Finally, airlines are carrying more passengers per flight. In fact, with roughly the same number of flights as in 1993, Logan Airport accommodated over 3 million more passengers. One reason for this is that the regional carrier network serving New England is more efficient. In 1993, there were three regional carrier systems serving 2.1 million regional passengers at Logan Airport. Since 1994, Logan Airport has been served by two regional airline systems (Business Express, now American Eagle, and US Airways Express). These carriers handled 2.2 million Logan Airport passengers in 1998. Key lessons learned from this are: 1) while PPP might work in conditions of overscheduling, such as the 1993 environment, because there is no sustained period of flight overscheduling at Logan Airport today, PPP would not provide meaningful delay reduction in the current operating environment; and 2) while delays declined from 1993 to 1997, Logan Airport continued to be one of the most delayed airports in the country because, even though carriers were more efficient at scheduling flights, delays caused by wind and weather continued to occur.

Code	Topic 1	Topic 2	Comment	Response
239.3	Public Health	Effects	The EIS does not take into account health impacts (Boston's inner city neighborhoods already have the highest asthma, emphysema and respiratory infection levels in the State--conditions greatly aggravated by plane and car fumes). The EIS does not take into consideration the environmental and quality of life issues of Boston's inner city residents.)	The available public health studies for communities adjacent to Logan Airport were reviewed and are presented in Section 6.8 of the Supplemental DEIS/FEIR. Public health status reports were available for the City of Boston; however, comparable public health reports were not available from the Public Health Departments of Chelsea, Revere, and Winthrop. A review of the available information did not indicate any causal relationship based on proximity to the airport, nor did it identify hearing loss as a public health concern.
239.4	Alternatives	Impacts	The EIS does not include the negative indemnity of real estate prices for the thousands of homes under the flight paths, nor the City's future lost tax revenues when what's left of Boston's middle class leave the area because they can no longer stand the persistent and excessive plane noise and fumes.	Section 1.3 of the Supplemental DEIS/FEIR discusses the importance of Logan Airport to the regional economy. The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR analyze the environmental impacts of the Airside Project, consistent with established federal and state scoping directives. Appropriate mitigation associated with the Airside Project has also been established. Massport has programs in place to reduce the environmental impacts associated with Logan Airport as a whole. These initiatives are described in the *Logan Airport ESPR* and its updates.
239.5	Regional Transportation	Regional Airports	Massport should direct significantly more flights to Hanscom Airport, located just 25 minutes from Boston and presently utilized at only a third of its capacity.	Hanscom Field, which serves as a general aviation reliever airport to Logan Airport, already accommodates a significant number of aircraft operations (183,000 operations in 1998). The Hanscom Field activity includes private, business, charter, and air taxi operations that might otherwise use Logan Airport. Since the Airside Project Draft EIS/EIR was filed, Shuttle America, a newly founded airline, began commercial scheduled operations at Hanscom Field, offering limited turboprop services to short-haul regional markets – Trenton, Buffalo, Hartford (discontinued), Wilmington, Delaware (discontinued), and Greensboro. Shuttle America is also conducting operations between Hanscom and New York LaGuardia Airport. While Massport supports commercial service at Hanscom Field consistent with its established policy (60-seat regulation), it believes that Hanscom Field will maintain its role as a major general aviation reliever, and that its geographic proximity to Logan, Worcester Regional and Manchester airports will prevent its development as a significant commercial airport. Additionally, commuter airlines serving Logan Airport are unlikely to move a significant number of flights from Logan Airport to Hanscom Field, since approximately 50 percent of passengers on Logan Airport's commuter flights connect to other Logan Airport flights. However, any new commercial service initiatives proposed for Hanscom Field shall be reviewed for consistency with the *Hanscom GEIR* (HGEIR), its Annual Updates, and applicable regulatory limitations, and shall be considered by the Hanscom Field Advisory Committee. Refer to Section 2.6 of the Supplemental DEIS/FEIR for a discussion of Hanscom Field. The environmental impacts of commercial services at Hanscom Field are summarized from the HGEIR and appear in Appendix B of the Supplemental DEIS/FEIR.
239.6	Alternatives	Peak Period Pricing	Another alternative which Massport has been unwilling to implement is Peak Hour Pricing, a demand management tool which is very successfully used in the hotel and tourism industry as well as the electric industry. ... In a democratic society, profit motives must not overrule the well-being of that society's citizens.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR contain an analysis of PPP as a demand management alternative at Logan Airport. The analysis indicates that PPP is an effective option when airlines schedule beyond the normal hourly operating capacity of the airport, and provides an assessment of the extent of the benefits of PPP under such circumstances. See Section 4.5 of the Supplemental DEIS/FEIR.

LETTER 240

Dear Mr. Pugsley,

I urge you to reject Massport's DEIS on the grounds that it uses old data to mislead the public regarding the delay situation at Logan. Delays at Logan were a non-issue before Massport began its campaign to build 14/32. Why did Massport develop its own delay measurement tool rather than use the FAA-approved delay measurement procedures? Why does Massport find it necessary to spenf 3 million dollars on consultants and advertisments? BECAUSE THEY ARE MISLEADING THE PUBLIC. 240.1

More importantly, MASSPORT HAS NOT TRANSLATED ANY INFORMATION REGARDING 14/32 or its impacts into Spanish, Haitian Kreyol, Vietnamese or Cambodian, even though these populations comprise a significant amount of the residents who will be affected by 14/32 in areas such as East Boston, Chelsea, Jamaica Plain, Roxbury, Dorchester, Roslindale and the South End. At present, most these people have no idea that Massport is planning to build a runway that a triple plane noise over their homes and make auto traffic and air pollution unbearable. Translation of important information is standard practice in both state and city agencies..even the utilitiy companies offer multi-lingual information. Under MEPA and NEPA regulations, Massport had an obligation to inform the public, particularly the affected communities, of the 14/32 plan and its impacts. By not translating information, they have failed to do this. 240.2

Sincerely,

Mrs. Regina Marchi
173 Lexington Street East Boston, MA 02128

Code	Topic 1	Topic 2	Comment	Response
240.1	Delay	Model	Delays at Logan were a non-issue before Massport began its campaign to build 14/32. Why did Massport develop its own delay measurement tool rather than use the FAA-approved delay measurement procedures?	Refer to Section 4.4 of the Supplemental DEIS/FEIR for a discussion on the estimation and modeling of flight delays. It includes a description of FAA and U.S. DOT delay measures and their limitations, an explanation of computer models for estimating flight delays, and historical data on delays at Logan Airport and other major United States airports. The methodology used for the Airside Project includes the effects of constraints at Logan Airport, and produces lower delay estimates than FAA modeling. The FAA approved all the models, which have been validated in previously published studies of Logan Airport.
240.2	Environmental Justice	Demographic Data	Massport has not translated any information regarding 14/32 or its impacts into Spanish, Haitian Kreyol [sic], Vietnamese or Cambodian, even though these populations comprise a significant amount of the residents who will be affected by 14/32...Under MEPA and NEPA regulations, Massport had an obligation to inform the public, particularly the affected communities, of the 14/32 plan and its impacts. By not translating information, they have failed to do this.	The Environmental Justice analysis was significantly expanded in Section 6.8 of the Supplemental DEIS/FEIR. Low-income and minority populations were defined in accordance with Federal Executive Order 12898, the U.S. DOT Final Order, and the Council on Environmental Quality's guidance on Environmental Justice. In addition, the analysis of low-income populations was expanded to include households at 150 percent of poverty level. This analysis found that there is no high and adverse disproportionate impact to low-income and minority populations from the Preferred Alternative. Adverse impacts are not predominately borne by low-income or minority populations. Only 21 percent of the population within the 65 dB DNL contour for the Preferred Alternative is minority, compared to the Suffolk County minority population of 38 percent. Less than two percent of the population within the 65 dB DNL contour for the Preferred Alternative has a household income less than 150 percent of poverty level. The additional area within the 65 dB DNL noise contour associated with the Preferred Alternative includes a predominately Hispanic neighborhood in Chelsea which is predicted under worst case assumptions to experience an increase of 0.6 dB or less. Under FAA standards, this change is not a significant adverse impact. Mitigation of the increased noise within the 65 dB DNL noise contour will be provided to affected communities in the form of residential sound insulation.

Mr. John Rodman,
Executive Officer of Environmental Affairs
100 Cambridge Street
Suite 2000
Boston, Ma. 02202

LETTER 241

Dear Mr. Rodman:

This is a letter in opposition to the 14/32 Runway being proposed by the Massachusetts Port Authority.

As a life-long resident of the East Boston community, what happens at Logan Airport is of great concern to me.

There have been many battles my community has fought in order to bring some peace and tranquility into the lives of those who want to live in the homes of their own choice.

One of these battles was fought in 1968 when dirt trucks were bringing illegal fill onto Bird Island Flats until the "Maverick Street Mothers", of which I am a member, stopped them bodily until Massport got the necessary papers and built an alternative road on their own property in order for them to continue bringing in the fill again.

Another battle in 1970 was against the STOL (Short Take Off and Landing) Runway. This runway, was proven not to be beneficial in alleviating any noise or air pollution from our neighborhood or any other neighborhood and was ultimately defeated. An injunction was instituted so that this STOL Runway could not be built to this day!

241.1

Massport is now resurrecting the same proposal under the name of 14/32 and trying to have the court injunction lifted so that it can be built. If this proposal failed in the 1970's, what has changed to make it passable now??

The neighborhoods are still here and so is Logan. This proposal would affect not only East Boston, Chelsea, Revere, South Boston, and Winthrop, which all receive the bulk of the air and noise pollution, but, would extend to Saugus, Everett, Charlestown, Cambridge, Dorchester, Quincy, Hull, etc.

Massport has presented 8 volumes of an impact study which I am sure is very impressive and has figures showing decimal levels of the noise in these communities at a low percentage. But, we, the people who live in these communities surrounding Logan, are unable to document our living conditions. We have neither the money, nor the means, to present volumes of data in opposition to the figures given by the Massport studies.

You, the deciding factor, have to rely on our word!

In the summer, when having a cook-out, you get the smell of jet fumes, instead of Bar-B-Que. Our windows have to remain closed all summer because of the smell of these same fumes and the noise, which makes it impossible to enjoy our own homes. If you hang your clean wash on a line out-doors, your clothes have the smell of jet fumes and soot when you bring them in. And, when you fall asleep or are watching T.V., the noise of planes flying overhead either awakens you or, comes at the most important part of the movie and drowns out the sound.

These, Mr. Rodman, are some of the so-called "benefits" to living so close to Logan. How would you like living under these conditions?

Because Logan exists and is here to stay, we try to accept it. But, WE DO NOT have to accept the fact that it wants to continue to grow so as to accomodate the travelers and the big businesses of this city. WE DO NOT have to, nor intend to, sit back and allow our constitutional rights to be taken from us or over-looked. We, as residents of East Boston, WILL continue to fight for our homes and living conditions! We hope that those who must make the decisions which involve, include, and affect OUR way of living, will realize that we, too, are entitled to live where we choose, with the same considerations as those who live in the suburbs.

Never, do we expect complete peace or tranquility because of Logan being within our midst. But, we can hope to maintain the level of what we now have and, not allow it to be taken away completely.

Please take our plight seriously and consider the neighborhoods surrounding Logan.

Vote to maintain the injunction on this runway and help us defeat the Massport proposal again. The need for another airport is the issue. Logan HAS, indeed, reached its saturation point many years ago.

Thank you.

Sincerely,

Betty Mazzarini

241.1	Environmental Review Process	Public Process	[Massport has continuously expanded with no regard for the residents of neighboring communities. Why is the current proposal for runway 14/32 different from the STOL runway stopped by the courts in the 1970s?]	The proposed uni-rectional Runway 14/32 is different from the runway proposed in the 1970s because under the current proposal all operations would occur over water, i.e., aircraft would arrive to the Runway 32 end with an approach over water and aircraft would depart from the Runway 14 end with a departure track over water. There would be no arrivals to the Runway 14 end and no departures from the Runway 32 end. Uni-directional Runway 14/32 would allow Logan Airport to maintain a three-runway configuration in Northwest winds, which would significantly reduce aircraft delays that occur in northwest winds. If Runway 14/32 was available in 1998, runway related delays would have been reduced by Runway Runway 32 percent. The proposed unidirectional Runway 14/32 would also provide FAA air traffic controllers with the ability to redirect more aircraft over water and away from people.

LETTER 242

Robert Durand
Massachusetts Environmental Policy Agency
100 Cambridge Street Suite 2000
Boston, MA 02202

James M McBride
10 Orleans Street # 404
East Boston, MA 02128

Dear Mr. Durand,

I am an 11 year resident of East Boston and would like to express my opinion regarding Massports expansion and proposed runway 14/32. East Boston residents have always lived in the shadow of Logan. I knew that when I moved to 10 Orleans Street here in East Boston. But to think Boston can survive another century without a second airport is crazy. 14/32 is a Band-Aid at best. There is a court injunction from the 1970s prohibiting Massport in building 14/32. There must be compelling reasons in that court decision why 14/32 is a bad idea. Health concerns and excess noise is fueling my opposition to runway 14/32. The proposed runway will directly affect my neighborhood. When second airports come up in conversations with either massport or the governor's office, Providence and Manchester's airports are mentioned as alternatives. It doesn't seem realistic that Massport and the Commonwealth would, or should give up the lucrative revenues (taxes) which come with the traveler. Massachusetts needs a second regional airport! Massport admits delays will surpass today's figures in 6-10 years even with the addition of 14/32. 242.1

These issues are bringing East Boston residents together like I have never seen before. I would be very interested in knowing how you stand on this issue? Thank you for listening.

Sincerely,

Jim McBride

242.1	Public Health	Effects	[Massachusetts needs a second major airport. The construction of Runway 14/32 is a temporary measure and will only serve to increase health effects in my East Boston neighborhoods.]	A second major airport is not a solution to the current delay and congestion problems at Logan Airport. The Proposed Project to reduce delay and enhance safety at Logan Airport must be implemented in the near term to address current and future operating conditions. The available public health studies for communities adjacent to Logan Airport were reviewed and are presented in Section 6.8 of the Supplemental DEIS/FEIR. Public health status reports were available for the City of Boston; however, comparable public health reports were not available from the Public Health Departments of Chelsea, Revere, and Winthrop. A review of the available information did not indicate any causal relationship based on proximity to the airport, nor did it identify hearing loss as a public health concern.

243.1	General Opposition		I am writing to voice my opposition to Runway 14/32. East Boston is already saturated with noise and air pollution from Logan Airport. Another 23,000 flights over East Boston each year is simply outrageous.	The goals of the Airside Project are to reduce delay, increase the airport's efficiency, and improve airfield safety in an environmentally responsible manner. The construction of unidirectional Runway 14/32 would prevent the significant drop in airfield capacity that now occurs during northwest wind conditions. The runway would not increase Logan Airport's normal operating capacity of approximately 120 operations per hour which is available nearly 80 percent of the year, but rather would allow this capacity to be maintained more consistently.

LETTER 244

92 Marginal Street
East Boston, Massachusetts

April 22, 1999

Robert Durand, Secretary
Massachusetts Executive Office of Environmental Affairs
Leverett Saltonstall State Office Building, 20th floor
100 Cambridge Street
Boston
Massachusetts
02202

ATTENTION: Arthur Pugsley

This concerns the Boston Logan Airport runways and taxiways proposal (EOEA #10458).

I understand that a significant percentage of flights *or* passengers from Boston Logan Airport originate at or are destined for New York City and Newark, New Jersey. With the approach of the Northeast Corridor high speed trains between these cities, I believe the planners should first learn the long term effect of the high speed service on the Boston-New York City-Newark market, for express (that is, time-sensitive) cargo as well as for passengers. After this, planning the runways project can proceed with *more* certainty of the needs of travelers than planners have now. 244.1

Considerable terminals and garage expansions have been taking place at the airport. Should the runways and taxiways improvements have been considered before the terminals and garages were expanded? Would Massport seek to expand the latter again if the runways and taxiways expand? 244.2

I appreciate whatever attention you give to this letter and for adding it to the environmental review record for the Boston Logan runways and taxiways improvement project.

Sincerely,

Christopher J. Morton

Christopher J. Morton

Letter 244
Christopher J. Morton
Private Citizens: East Boston

Code	Topic 1	Topic 2	Comment	Response
244.1	Regional Transportation	Passenger Rail	...planners should first learn the long term effect of the high speed service on the Boston-New York City-Newark market, for express (that is, time-sensitive) cargo as well as for passengers. After this, planning the runways project can proceed with more certainty of the needs of travelers than planners have now.	The potential diversion of cargo operations was not specifically analyzed because cargo operations account for only two percent of aircraft activity at Logan Airport and since most all-cargo aircraft operate during off-peak hours, cargo operations do not contribute to delays at Logan Airport. However, all cargo operations were included in the future fleets analyzed in the Airside Project. Additionally, some cargo is now being diverted to regional airports as indicated by the strong growth in cargo services and air cargo activity at the regional airports.
244.2	Cumulative Impacts	Landside Improvements	... Would Massport seek to expand the [terminals and garages] again if the runways and taxiways expand?	The purpose of the Airside Improvements Planning Project is to reduce current and projected levels of airfield congestion and delay and to enhance the safety of aircraft operations at Logan. Massport's proposed landside improvements are planned to enhance the efficiency of passenger processing, and include terminal modernization, as well as roadway, parking and service area improvements. The landside projects will not affect the design or implementation of the Airside Project, which has independent utility, nor will the Airside Project improvements affect the design or implementation of any of the landside projects. All airside and landside projects, where required, will continue to be the subject of separate comprehensive environmental analysis by project proponents in accordance with federal and state regulations. As expressed in the May 7, 1999 EOEA Certificate, Massport's Environmental Planning and Status Report (ESPR, formerly GEIR) process "is expected provide a big picture cumulative impact analysis of Logan operations, impacts and mitigation. It complements the project-specific EIRs," such as this one for the Airside Improvements, "helps to focus the review process of individual EIRs, and ensures that segmented project review does not occur in the context of MEPA review at Logan Airport."

LETTER 245

RE: Logan 2000 Airside Improvements Project Draft EIS/EIR

April 22, 1999

Dear Secretary Durand,

I am writing to ask you to find the Massachusetts Port Authority's Logan 2000 Airside Improvements Project Draft Environmental Impact Statement/Environmental Impact Report inadequate and to require Massport to undertake a full examination of both the true impacts of and the real alternatives to its proposed Runway 14/32 (also known as the Short Take-off and Landing, or STOL, Runway) and new centerfield taxiway. As a longtime resident of East Boston, I am outraged that neither the clear and significant impacts of this "improvements" project on my neighborhood nor the well-founded objections of its residents have not received fair consideration in Massport's environmental documents. 245.1

Since the 1974 court order against Runway 14/32, no Massport administration until now has revived the agency's efforts to complete and open the runway, and for good reason. Its putative benefits are far outweighed by its environmental impacts on surrounding communities already saturated by the noise, pollution, traffic, and other off-airport consequences of airport growth. Because Massport used outdated studies and figures that distort the benchmarks for these impacts, the Draft EIS/EIR does not fairly represent their future intensification. Massport also failed to acknowledge the fact that because a number of major airlines have sought waivers, the conversion of airline fleets from Stage 2 to Stage 3 (that is, from noisier to quieter) aircraft will be significantly slowed, diminishing any noise benefit Massport anticipates from changes in the fleet mix. In addition, Massport departed from established FAA modeling guidelines, further understating the combined effects of Runway 14/32 and the new centerfield taxiway. 245.2 245.3 245.4

Finally, Massport has ignored the full range of available alternatives: regionalization of air traffic, including facilities at Hanscom, Worcester, Providence RI, and Manchester NH, as well as the potential for cargo diversion to Pease in southern New Hampshire. The state and the agency have long skirted the need to seriously consider, study, and set land aside in the area beyond Route 128, where more than half of Logan's traffic originates, for a second airport with a fast-rail link to Boston. 245.5

Please use your statutory authority to require Massport to fulfill its public obligations under MEPA by undertaking a full and accurate study of its proposed airfield expansion program – a study that gives Logan-impacted communities fair consideration and weighs the genuine alternatives available.

Sincerely,

cc: Governor Paul Cellucci
Mayor Thomas Menino
Peter Blute, Executive Director, Massachusetts Port Authority

Letter 245

Code	Topic 1	Topic 2	Comment	Response
245.1	Environmental Review Process	MEPA	...require Massport to undertake a full examination of both the true impacts of and the real alternatives to its proposed Runway 14/32 (also known as the Short Take-off and Landing, or STOL, Runway) and new centerfield taxiway...neither the clear and significant impacts of this "improvements" project on my neighborhood nor the well-founded objections of its residents have not [sic] received fair consideration in Massport's environmental documents..	The Draft EIS/EIR and the Supplemental DEIS/FEIR analyze the environmental impacts of the Airside Project, consistent with established federal and state scoping directives. Appropriate mitigation associated with the Airside Project has also been established. Massport has programs in place to reduce the environmental impacts associated with Logan Airport as a whole. These initiatives are described in the *Logan Airport ESPR* and its updates.
245.2	Alternatives	Impacts	...the runway ... benefits are far outweighed by its environmental impacts on surrounding communities already saturated by the noise, pollution, traffic, and other off-airport consequences of airport growth.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR analyze the environmental impacts of the Airside Project, consistent with established federal and state scoping directives. Appropriate mitigation associated with the Airside Project has also been established. Massport has programs in place to reduce the environmental impacts associated with Logan Airport as a whole. These initiatives are described in the *Logan Airport ESPR* and its updates.
245.3	Noise	Hushkitted Aircraft	Massport also failed to acknowledge the fact that because a number of major airlines have sought waivers, the conversion of airline fleets from Stage 2 to Stage 3 (that is, from noisier to quieter) aircraft will be significantly slowed, diminishing any noise benefit Massport anticipates from changes in the fleet mix.	The phaseout of Stage 2 aircraft operations was complete as of December 31, 1999. The study does not overstate the benefit of further conversion to Stage 3 aircraft on future noise levels. It uses two fleet scenarios in which almost all aircraft meet Stage 3 requirements, either as hushkitted Stage 2 aircraft or new Stage 3 aircraft, and three fleet scenarios in which all the aircraft meet Stage 3 requirements. Most of the aircraft are new high-bypass, engine-powered Stage 3 aircraft. Many of the hushkitted aircraft have been retired.

Code	Topic 1	Topic 2	Comment	Response
245.4	Delay	Model	Massport departed from established FAA modeling guidelines, further understating the combined effects of Runway 14/32 and the new centerfield taxiway.	Refer to Section 4.4 of the Supplemental DEIS/FEIR for a discussion on the estimation and modeling of flight delays. It includes a description of FAA and U.S. DOT delay measures and their limitations, an explanation of computer models for estimating flight delays, and historical data on delays at Logan Airport and other major United States airports. The methodology used for the Airside Project includes the effects of constraints at Logan Airport, and produces lower delay estimates than FAA modeling. The FAA approved all the models, which have been validated in previously published studies of Logan Airport. The FAA Technical Center was responsible for the capacity and delay results in the 1992 FAA Capacity Enhancement Report for Logan Airport that concluded the need for Runway 14/32, reduced minimums and taxiway improvements. The Technical Center simulated Logan Airport airfield operations with the RDSIM model and estimated that when activity reached 504,000 annual operations, total delay would exceed 260,000 hours per year. The Airside Project Draft EIS/EIR forecasts delays to increase to 157,500 hours per year when annual operations reach 510,000 with the 29M Low Fleet scenario. The Supplemental DEIS/FEIR compares the FAA Technical Center delay estimates in 1992 with those of the Logan Airside Project estimates. The FAA has concluded that the Airside delays represent "a plausible and conservative estimate...." The FAA consistently rates Logan Airport as one of the most delay prone airports in the United States Logan Airport's estimated annual delay hours are over five times the FAA's 20,000-hour threshold for a severely delayed airport.
245.5	Regional Transportation	Regional Airports	Finally, Massport has ignored the full range of available alternatives: regionalization of air traffic, including facilities at Hanscom, Worcester, Providence, RI, and Manchester, NH, as well as the potential for cargo diversion to Pease in southern New Hampshire.	Logan Airport is part of a regional system of airports that includes T.F. Green/Providence, Worcester Regional and Manchester. Massport has long recognized that service development and increased passenger traffic at these airports are an important part of the region's long-term strategy to accommodate passenger and activity growth. Massport has actively encouraged the development of regional airports and full use of other options, including high-speed rail to Logan Airport's largest market, New York. Regional service was examined in Chapter 2 of the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR. This analysis supports the conclusion greater use of the regional airports will provide passengers within the service area of such airports with a viable alternative to Logan Airport. Since demand within Logan Airport's primary service area will remain strong, the improvements at other regional airports will not eliminate the need for airside projects at Logan Airport. Dispersion modeling indicates no violation of the NAAQS, which were designed to protect human health and welfare.

3/14/99

LETTER 246

Robert Durand,secretary of environmental affairs

Dear sir:

I have lived in East Boston for almost 47 years and I have seen it, felt the damage and pain Logan has inflicted on this and the surrounding communities over the years. That noise, pollution, and the traffic combine to create stress and other health effects that I know cause premature death! Many of my neighbors whom were 15 to 20 years older than myself growing up have died as a result of cancer and heart disease. I've sat down and talked over the situation and have come up with seventeen people all of whom lived within a stones throw of my house with cancer or have died prematurely from cancer or heart disease. Studies show high levels of asthma, cancer, and heart disease, around airports. Studies done around the world that show the airports are a major source of pollution. On the issue of noise 65 dB average that is used means nothing when you can't get more than three hours sleep. I have lived next door to a school which has been soundproof for years. My house has only a few thousand feet from the proposed new runway and I'm supposed to believe that taking the smallest quietest planes out over the water will actually help alleviate the noise. That may partially help for two or three years, at best. After this peroid when the slots that these planes left open on the longer run ways are filled by larger jets that supposed to handle the increase from 26 to 46,000,000 passengers the situation gets worse. They tell us don't worry the craft in the coming years will all be stage three. The only problem is they've been telling us most of the planes now landing at Logan are stage three. If this is the case stage three is not the solution. Stage three is far too noisy. Another problem with stage three aircraft is that they produce even more NOX gases than stage two did. Massport has done nothing to seek realistic alternatives to Logan even though they knew runways were a problem decades ago. They are now just trying to buy time. They have no long-range plan unless you call having Manchester in New Hampshire or T F Greene in Rhode Island the plan from Massachusetts. They have made no reasonable effort to find a real solution to an over crowded airport which has no room to expand. They make no bones about having to cut down the delays so that people attending the proposed new convention center won't be angry when they get here. Gloria Larsen testified at a Boston city council hearing on runway 14/32 that people coming to the convention center will be angry if they are delayed. That shot cited comment

246.1

caused an uproar, she did not get to finish her testimony. Doesn't she think people get angry when they can't sleep? this shows how of touch the current people running the convention center and massport really are! They have no problem putting money over quality of life. Peter Blute doesn't lived in or around Boston so it doesn't effect his quality of life. He has heard many stories from dozens if not more people all around Boston and the surrounding communities of the degrading effects that Logan has, apparently he doesn't care! Massports study shows that only 20% of the people coming into the airport have Boston as a final destination. Boston should not bear the burden for the entire region, enough is enough, **quality of life must come first!**

Sincerely,

Richard Salini

Logan Airside Improvements Planning Project - Draft EIS/EIR
URS Greiner, March 1997

Scientists Spending big dollars doing Research to duplicate human Noses for smell, + Tongues for taste, We have 10's of Thousands of real ones here!

From 1993 Annual Update

Table VI-6 Status of Air Quality Mitigation Measures

Objective	Initiatives	Status
Reduce Emissions of VOC, NOx, and CO		
Reduce emissions from 1990 levels to the greatest extent possible.	Pursue reduced engine taxiing for inbound aircraft.	Massport is examining the feasibility of reduced engine taxiing as part of the feasibility analyses being conducted to assess a variety of potential airside improvements. The issues to be evaluated include operational implications, the role of airlines and the Federal Aviation Administration (FAA), and potential noise impacts.
	Prepare and implement a plan to control emissions from Massport's Logan Airport-based fleet vehicles.	Massport has undertaken a comprehensive review of its vehicle fleet at Logan Airport to explore opportunities for acquiring less polluting vehicles and for targeting VOC sources. Massport is committed to developing a plan by 1996 to make all practicable conversions from gasoline or diesel to alternative fuels. As part of this conversion process, Massport currently is purchasing 10 alternative fuel-powered vehicles and also is pursuing the development of a compressed natural gas (CNG) filling station on Logan Airport.
	Encourage Massport tenants to prepare ground service vehicle emissions control plans by 1996, with implementation by 1999.	Massport is supporting tenant vehicle conversion initiatives similar to those underway for Massport vehicles by participating, along with over 80 percent of airport tenants, in a comprehensive study of electric vehicle use at Logan Airport. Massport also is working with tenants to develop a ground service vehicle emissions control plan. Actions taken by Massport to support this plan include a survey and analysis of ground service support vehicle activities and emissions; studies to determine the air quality effects of alternative fuel sources; and a plan for conversion of vehicles to a variety of alternative fuel sources.
	Install vapor recovery systems for fuel storage and handling equipment.	During the design of the new jet fuel distribution system at Logan Airport, Massport will assess the necessity of installing further vapor controls. Since jet fuel is not subject to significant losses via evaporation, major emphasis in designing the new system will be directed toward the more relevant issue of eliminating leaks and spills.
	Construct new jet fuel distribution system.	The new jet fuel distribution system involves the consolidation of distribution activities in a double-loop distribution system around the airfield apron area; the installation and replacement of individual terminal fuel hydrants; the provision of connections between existing and new hydrant systems; and the implementation of an emergency fuel shut-off system. Design is now 30 percent complete and construction is expected to begin in 1995.
	Evaluate power plant energy sources.	Massport is currently evaluating the Central Heating Plant and is evaluating a variety of fuel combinations based on cost and air quality factors. Massport will install NOx Reasonable Available Control Technologies (RACT) measures on the Central Heating Plant in accordance with Clean Air Act requirements.
Reduce Odors		
Reduce perceived odors through reduction of VOC emissions.	Form Odor Panel to study odor sources and reduction strategies.	Massport plans to form an Odor Panel to assess odor impacts and consider strategies and efforts to reduce odor impacts.
	Recommend measures to reduce odor.	Massport has undertaken several initiatives to address the odor issue including an analysis of odor complaints received by Massport to determine locational impacts, operational factors, and contributing environmental conditions; an analysis of odor compounds relating concentration levels and potential public health impacts; and an analysis of the relationship of odors to aircraft engines and airfield activity.
Conduct Monitoring and Reporting		
Conduct additional air quality monitoring.	Conduct BTEX monitoring study.	Massport conducted a study of BTEX compounds at Logan Airport during August 1993; the results of the study are reported in this Annual Update. (See Appendix E.)
Provide annual air quality reporting.	Prepare an Air Quality Annual Update.	This submission forms the first formal Air Quality Annual Update for the years between GEIR filings. This air quality data is included as part of a comprehensive Logan Airport 1993 Annual Update and it provides air quality information for the year 1993.

Note: Ground transportation mitigation measures which reduce VMT and automobile idling times will provide significant air quality benefits. These are described in Chapter V, Ground Transportation.

Code	Topic 1	Topic 2	Comment	Response
246.1	Alternatives	Preferred Alternative	Massport has done nothing to seek realistic alternatives to Logan even though they knew runways were a problem decades ago.	The improvement concepts evaluated in the Airside Project Analysis evolved from prior studies including the FAA's *Logan Capacity Enhancement Plan* (October 1992); the *Logan Runway Incursion Mitigation Plan/Taxiway Relocation Study* (December 1993); the *Logan Final GEIR* (July 1993); and the *Logan Airside Improvements Feasibility Study, Phase 1 Report*, published in July 1995. The FAA evaluated a numerous physical, operational, and administrative concepts for reducing Logan Airport delays in its *Boston Logan International Airport Capacity Enhancement Plan.* The FAA recommended several improvement concepts, including unidirectional Runway 14/32, for further study. These improvement concepts, as well as concepts from other studies, were individually examined by Massport in the *Logan Airside Feasibility Study*, published in July 1995. Based on the Feasibility study, some concepts were rejected and the most promising concepts were combined into the Alternatives considered in the Airside Project Draft EIS/EIR. The alternatives analysis in the Airside Project Draft EIS/EIR is consistent with state and federal scoping directives for the Airside Project. The results of the Airside analysis indicate that alternatives that include unidirectional Runway 14/32 provide the most benefit in terms of delay reduction and ability to achieve PRAS goals.
246.2	Air Quality	NAAQS	[The] Volume IV Air Quality model results show that VOCs will more than double at Jeffries Point, the closest area to the proposed new runway!	One-hour VOC concentrations (used as an indicator of odor) increase only slightly at Jeffries Point with the Preferred Alternative, when compared to the No Action Alternative. The predicted increase is so small that changes in odor will remain imperceptible, as measured against the No Action Alternative. Concentrations decrease at all other receptors with the Preferred Alternative.

LETTER 247

March 24, 1999

Robert Durand, Secretary
Executive Office of Environmental Affairs
100 Cambridge Street, Room 2000
Boston, MA 02202

Sir,

I am writing to tell you of my objections to the airside expansions at Logan International Airport. There are a number of major issues that I wish to discuss here. I am aware that there is much concern for the increase in noise generated by an increase in air traffic. I also am very concerned with this aspect. Because I have other concerns that require consideration I will address the noise issue last.

I do believe that there will be an increase in air travel during the next ten, twenty or even thirty years. With a growing global population what else could occur? However with the increase in passengers there will be a new class of aircraft: they will be larger, heavier, more powerful, and with a greater capacity for carrying goods and passengers. These marvels of flight will be the biggest and most powerful commercial aircraft yet constructed. They are often referred to as NLA, or New Larger Aircraft. Specification for these aircraft include the capability to accommodate 550 to 650 passengers in a three class seating layout on two or three passenger decks, or 966 passengers in an economy layout. The wing span of the behemoth exceeds 260 feet with a length of more than 258 feet as compared to the familiar B747 "Jumbo Jet" with a wing span of only of 195 feet and being 231 feet in length. Maximum weight at take-off will exceed 952,000 pounds, or 476 tons. A fully loaded B747-200 has a maximum take-off weight of approximately 780,000 pounds. The FAA reports that not all airports will be able to accommodate these larger aircraft due to the dimensional requirements and increased difficulty in ground handling.

It will not be the airport infrastructure alone that will require major improvements. Methods to move the hordes of newly arrived passenger will be required. Every passenger that deplanes will be replaced by a passenger set to embark on a plane ride to somewhere else. Logan is a terminus airport. Very few passengers will be simply switching planes without making an impact on the environment. More Buses, More Subway Cars, More Taxi Cabs, More Rental Cars, More Congestion, More Pollution. Everyone will want to know why the CAT project wasn't effective? And what happened to the promise of traffic relief?

Everything that I have researched on the subject, from product overview of the Airbus product to runway and taxiway dimensional requirements of the comparable Boeing

product, coupled with my understanding of aviation and aeronautics has led me to believe that the airside expansion project at Logan is actually being designed to prepare for the use of this next generation of passenger aircraft, NLA. Logan International is not an appropriate place for the operation of these NLA. Logan is a terminus, the final destination. Aircraft with the incredible capacity of an NLA are certainly better suited to regional hub airports. The collateral damage that does occur in the densely populated communities that surround an inner-city airport, such as Logan, will increase disproportionately..

In my opinion the proposed airside changes are not being undertaken wholly for the reasons Massport is claiming. The proposed new center taxiway and other taxiway modifications and improvements are not about reducing engine run time and reducing ground noise and air pollution. The proposed changes are needed to accommodate the ground movement of these dimensionally ungainly aircraft. The addition of a new runway, 14/32, at near parallel to 15R/33L, plus the less publicized proposed lengthening of runway 15L/33R, are not at all about easing delays caused by weather, as Massport claims. The new runway, and modifications to others, are required to allow for the "hold time" between the departure of an NLA and any other aircraft. Aircraft in queue are vulnerable to the wake vortex generated by each previous aircraft taking off. The atmospheric disruption of the NLA would be significantly higher current commercial jet aircraft, making the runway unsafe and unusable for 3 to 5 minutes or longer. Aircraft next-in-line to take-off would be launched from either the proposed 14/32 or 15L/33R until the wake vortex at the end of 15R/33L dissipated and the runway could be safely used. If NLA were otherwise compatible for operation at Logan, this might be constructive planning. Unfortunately NLA are fraught with hazards that are too challenging for this inner-city location. The scheme is simply short-sighted. 247.1

Enabling the use of NLA also invites the potential problems associated with air pollution. With a capacity exceeding that of any aircraft able to currently operate from Logan, the power that will be required to launch these craft airborne will also be considerably higher. More power is More fuel is More pollution. It is simply true bigger engines burn more fuel. The FAA reports that the fuel needs of the engine of an NLA may require a wide assortment of fuel additives in amounts that would cause even greater concern for air quality. The burned by-products of these compounds will be spread over the immediate land and seascape at presumably twice the rate now experienced.

Another facet of the proposed expansion is to request that the FAA "administratively reduce the approach minimums". ***In essence the reduction of these minimums for a pilot's go/no go landing decision making criteria is a reduction in safety protocol.*** It seems that the management and operation of this airport occurs without regard for the existence of the adjacent residential communities. I am in full agreement with the mathematical exercise that shows how delays could be reduced if runways were more available during poor weather. But the math doesn't factor the safety of the life and property involved. There is no accounting of the performance of aircraft in the equation either. Will a DC-9/30 perform in a weather related crisis the same as an A320, B757, 247.2

Dash 8, F.27 or an NLA? They are all individual aircraft with their own unique characteristics and flown by different people who will possess a range of years of professional experience from none to many. Imagine! The reduction of delays would be even more significant if safety protocols were eliminated entirely. Revenues from increased gate fees would certainly offset the occasional disaster.

Noise is an issue. I am appalled at the criteria utilized in the Environmental Impact Statement required by the Massachusetts Environmental Policy Act to quantify the sound levels that occur from aircraft noise events. The measurement of decibels using an "A" weighted scale is totally inappropriate for noise events of the magnitude created by aircraft. The "A" scale is only useful to monitor levels that are audible to the human ear. Very nice for setting up your home stereo system. Noise produced by aircraft covers a spectrum much greater than the audible range. The frequency of sounds from an aircraft range from infrasonic, below the level of auditory sensitivity, to ultrasonic, above the level of human auditory sensitivity. The intensity of all sounds are of concern to me. ***Because I can't hear the frequency at which a sound occurs is not evidence that there isn't any detriment from it.*** We can't see ultraviolet radiation or gamma radiation because they exist beyond our capability to sense them. We are, however very much aware of the physical damage they cause. So it is with sound. The infrasonic impact of the noise event is highly significant. 247.3

Take a walk through the Day Square area of East Boston. When a jet aircraft takes off, you are standing below the flight path. The noise that you hear will prevent you from conversing with people you meet on the street. The infrasonic sound has enough power to move parked cars; and motion-sensitive theft alarm systems will be activated. Even if the audible noise was reduced, the power of the infrasonic sound produce by the aircraft in flight would still move the cars and create a collateral impact of audible noise. The alarms continue for 60 to 90 seconds before the automatically reset. Guess what?? In another 90 seconds another jet will take off and this rude and cacophonous event recurs. An increase in aircraft operations will cause an increase in the frequency of the collateral noise events that are now occurring throughout the area. This type of collateral impact on the environment is directly related, not coincidental, and cannot be overlooked as it has thus far. It is also important to acknowledge that just like radiation that we cannot see, sounds we cannot hear can cause humans physical harm. Infrasonic frequencies can cause motion and irritation to internal body organs.

Window replacement and sound proofing programs are a foolish waste of funds. These programs are socially irresponsible activities that turn citizens into nothing more than prisoners in their homes. An increase in capacity at Logan will render city street, parks, squares, and residential backyard unusable. Community will whither and die; and vacant neighborhoods are a fertile environment for crime. 247.4

In my opinion the airside improvement project is a mistake that will lead to major economic problems in the future. The recent trends in true urban revitilization comprised of a balance of commercial projects and an increase in urban residency, will halt. The

next generation of commercial aircraft is not appropriate for an airport that is situated in a highly populated, residential area of any city. Logan International Airport is simply not able to continue to grow beyond it's current capacity. This airport should be considered fully matured as an operational entity. Acting to enable an increase in capacity of an already over-burdened airport in a fragile, historic Boston neighborhood would be thoughtless and short-sighted. Capital improvements of this nature are not even a Band-Aid solution to the transportation challenges of the future. It is surprising that they would even be considered.

Another airport is required to share the staggering increase of air traffic in the future. Few world class cities operate with only one airport. Paris has four, New York City and Washington, D.C. are served by three. For the New England region and Boston to remain prominent and prosper in the global economy over the next fifty years requires that we all accept the fact that a new, world class regional airport is required. In the near future other means should be implemented to alleviate the over capacity at Logan; expansions of commercial passenger operations at Worcester and Hanscom Field, relocation of cargo operations to Hanscom Field, and Peak-Hour pricing. 247.5

Thank you for taking the time to consider my thoughts on these issues. Please contact me if you have any questions about this letter.

Sincerely,

Mark W. Stettler

Code	Topic 1	Topic 2	Comment	Response
247.1	Alternatives	Taxiway Improvements	...The proposed new center taxiway and other taxiway modifications and improvements are not about reducing engine run time and reducing ground noise and air pollution. The proposed changes are needed to accommodate the ground movement of [the next generation of passenger aircraft, New Larger Aircraft (NLA)]... If NLA were otherwise compatible for operation at Logan, this might be constructive planning. Unfortunately NLA are fraught with hazards that are too challenging for this inner-city location. The scheme is simply short-sighted.	So-called New Large Aircraft (NLA) carrying up to 1,000 passengers are still just in the discussion phase. No manufacturer has undertaken serious development of such aircraft yet, which would be a multi-year process. These aircraft would probably require modifications to existing airport jetways and apron areas along with increases in taxiway width and turning area. Their use would be limited to extremely high-density markets, and it is not likely that Boston would be among these. In fact, the number of "jumbo jets" serving Logan Airport has declined in recent years.
247.2	Alternatives	Reduced Approach Minima	...the reduction of [approach minimums] for a pilot's go/no go landing decision making criteria is a reduction in safety protocol. It seems that the management and operation of this airport occurs without regard for the existence of the adjacent residential communities.	Reduced landing minimums provide for a safer approach by providing precision guidance at lower altitudes, and thus a safer approach." The reduced landing minimums do not change the approach path nor reduce the clearance between aircraft and the surface. Rather, they shift the location at which a missed approach decision is initiated closer to the airport. For Runways 27 and 22L, the reduced minimums will make the approach procedures flown by pilots more consistent with FAA standards in effect at most other airports. Reduced landing minimums will increase airfield safety by allowing operations more directly into the prevailing wind and will help improve PRAS goal achievement.
247.3	Noise	Impacts	The measurement of decibels using an "A" weighted scale is totally inappropriate for noise events of the magnitude created by aircraft. The "A" scale is only useful to monitor levels that are audible to the human ear. ... Noise produced by aircraft covers a spectrum much greater than the audible range. ...Because I can't hear the frequency at which a sound occurs is not evidence that there isn't any detriment from it.	Use of A-weighted decibels and DNL are by far the most appropriate metrics for evaluating noise impacts at airports as well as many other noise sources; use of the metrics are also required for federal environmental documents. See discussion of noise metrics in Appendix E of the Supplemental DEIS/FEIR.
247.4	Open Space/ Parkland	Impacts	An increase in capacity at Logan will render city street, parks, squares, and residential backyards unusable.	Implementation of the Preferred Alternative would not increase capacity, but rather it would correct a series of deficiencies in the airfield geometry and operation. Massport's plans to handle the ground access requirements of future passenger levels are discussed in the *Logan Airport 1999 ESPR* (previously GEIR) and its subsequent Environmental Data Reports (Annual Updates).

Code	Topic 1	Topic 2	Comment	Response
247.5	Alternatives	Other Non-Construction Alternatives	In the near future other means should be implemented to alleviate the over capacity at Logan; expansions of commercial passenger operations at Worcester and Hanscom Field, relocation of cargo operations to Hanscom Field, and peak-hour pricing.	The alternative analysis conforms to FAA and MEPA scoping directives. The impact of the regional alternatives has been addressed through the study of a range of forecast activity levels. Refer to Chapter 2 of the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR for a comprehensive discussion of regional alternatives. Massport advocates increased use of the regional airports and high-speed rail services, in addition to construction of Runway 14/32 and the other airside improvement projects at Logan Airport, as a comprehensive plan for ensuring an efficient and balanced regional transportation system. As the analysis in Chapter 2 indicates, these off-airport alternatives are expected to reduce aircraft traffic growth pressures at Logan Airport, but they will not eliminate airside delays at Logan Airport that occur because of a third operating runway during periods of northwest winds. The Preferred Alternative, which specifically addresses this deficiency, is necessary and provides clear benefits at current aircraft traffic levels. These benefits will only increase in the future, even as developments at the regional airports and high-speed rail to New York act to reduce the rate of future growth at Logan Airport.

LETTER 248

April 23, 1999

Mr. Arthur Pugsley
MEPA Unit
Executive Office of Environmental Affairs
100 Cambridge St., 20th Floor
Boston, MA 02202

Sir,

I am writing to tell you of my comments on the Draft Environmental Impact Statement for Logan Airside Improvements Planning Project at Logan International Airport. There are a number of major issues that I wish to discuss here. I am aware that there is much concern for the increase in noise generated by an increase in air traffic. I also am very concerned with this aspect. Because I have other concerns that require consideration I will address the noise issue last.

There has been no fair consideration given to the impact on the environment due to the increased capacity of the airport and the ability of the airport to facilitate the use of New Larger Aircraft (NLA) subsequent to the proposed modifications. 248.1

I do believe that there will be an increase in air travel during the next ten, twenty or even thirty years. With a growing global population what else could occur? However with the increase in passengers there will be a new class of aircraft: they will be larger, heavier, more powerful, and with a greater capacity for carrying goods and passengers. These marvels of flight will be the biggest and most powerful commercial aircraft yet constructed. They are often referred to as NLA, or New Larger Aircraft. Specification for these aircraft include the capability to accommodate 550 to 650 passengers in a three class seating layout on two or three passenger decks, or 966 passengers in an economy layout. The wing span of the behemoth exceeds 260 feet with a length of more than 258 feet as compared to the familiar B747 "Jumbo Jet" with a wing span of only of 195 feet and being 231 feet in length. Maximum weight at take-off will exceed 952,000 pounds, or 476 tons. A fully loaded B747-200 has a maximum take-off weight of approximately 780,000 pounds. The FAA reports that not all airports will be able to accommodate these larger aircraft due to the dimensional requirements and increased difficulty in ground handling.

I have researched on the subject, from product overview of the Airbus product to runway and taxiway dimensional requirements of the comparable Boeing product. This information along with my understanding of aviation and aeronautics, leads me to believe that the airside expansion project at Logan is actually being designed to prepare for the use of this next generation of passenger aircraft, NLA. ***Logan International is not an appropriate place for the operation of NLA.*** Logan is a terminus, the final destination. Aircraft with the incredible capacity of an NLA are certainly better suited to regional hub

airports. The collateral damage that does occur in the densely populated communities that surround an inner-city airport, such as Logan, will increase disproportionately.

In my opinion the proposed airside changes are not being undertaken wholly for the reasons Massport is claiming. The proposed new center taxiway and other taxiway modifications and improvements are not about reducing engine run time and reducing ground noise and air pollution. The proposed changes are needed to accommodate the ground movement of these dimensionally ungainly aircraft. The addition of a new runway, 14/32, at near parallel to 15R/33L, plus the less publicized proposed lengthening of runway 15L/33R, are not at all about easing delays caused by weather, as Massport claims. The new runway, and modifications to others, are required to allow for the "hold time" between the departure of an NLA and any other aircraft. Aircraft in queue are vulnerable to the wake vortex generated by each previous aircraft taking off. The atmospheric disruption of the NLA would be significantly higher current commercial jet aircraft, making the runway unsafe and unusable for 3 to 5 minutes or longer. Aircraft next-in-line to take-off would be launched from either the proposed 14/32 or 15L/33R until the wake vortex at the end of 15R/33L dissipated and the runway could be safely used. If NLA were otherwise compatible for operation at Logan, this might be constructive planning. ***Unfortunately NLA are fraught with hazards that are too challenging for this inner-city location.*** The scheme is simply short-sighted.

There has been no fair consideration given to the impact on the environment regarding air and water pollution due to the increased capacity of the airport and the ability of the airport to facilitate the use of New Larger Aircraft (NLA) subsequent to the proposed modifications. 248.2

Enabling the use of NLA also invites the potential problems associated with air pollution. With a capacity exceeding that of any aircraft able to currently operate from Logan, the power that will be required to launch these craft airborne will also be considerably higher. More power is More fuel is More pollution. It is simply true that bigger engines burn more fuel and bigger aircraft need more engines. ***The FAA reports that the fuel needs of the engine of an NLA may require a wide assortment of fuel additives in amounts that would cause even greater concern for air quality.*** The burned by-products of these compounds will be spread over the immediate land and seascape at presumably twice the rate now experienced.

There has been no fair consideration given to the impact on the environment regarding the physical infrastructure of the City of Boston due to the increased capacity of the airport and the ability of the airport to facilitate the use of New Larger Aircraft (NLA) subsequent to the proposed modifications. 248.3

It will not be the airport infrastructure alone that will require major improvements. Methods to move the hordes of newly arrived passenger will be required. Every passenger that deplanes will be replaced by a passenger set to embark on a plane ride to somewhere else. Logan is a terminus airport. Very few passengers will be simply

switching planes without making an impact on the environment. More Buses, More Subway Cars, More Taxicabs, More Rental Cars, More Congestion, and More Pollution. Everyone will want to know why the CAT project wasn't effective? And what happened to the promise of traffic relief?

There has been no fair consideration given to the impact on the environment regarding the safety and welfare of the affected communities due to the increased capacity of the airport and the ability of the airport to facilitate the use of New Larger Aircraft (NLA) subsequent to the proposed modifications.

Another facet of the proposed expansion is to request that the FAA "administratively reduce the approach minimums". ***In essence the reduction of these minimums for a pilot's go/no go landing decision making criteria is a reduction in safety protocol.*** It seems that the management and operation of this airport occurs without regard for the existence of the adjacent residential communities. I am in full agreement with the mathematical exercise that shows how delays could be reduced if runways were more available during poor weather. But the math doesn't factor the safety of the life and property involved. There is no accounting of the performance of aircraft in the equation either. Will a DC-9/30 perform in a weather-related crisis the same as an A320, B757, Dash 8, F.27 or an NLA? They are all individual aircraft with their own unique characteristics and flown by different people who will possess a range of years of professional experience from none to many. ***Imagine! The reduction of delays would be even more significant if safety protocols were eliminated entirely.*** Revenues from increased gate fees would certainly offset the occasional disaster.

248.4

There has been no fair consideration given to the impact on the environment regarding the increase of infrasonic sound due to the increased capacity of the airport and the ability of the airport to facilitate the use of New Larger Aircraft (NLA) subsequent to the proposed modifications.

248.5

Noise is an issue. I am appalled at the criteria utilized in the Environmental Impact Statement required by the Massachusetts Environmental Policy Act to quantify the sound levels that occur from aircraft noise events. The measurement of decibels using an "A" weighted scale is totally inappropriate for noise events of the magnitude created by aircraft. The "A" scale is only useful to monitor levels that are audible to the human ear. Very nice for setting up your home stereo system. Noise produced by aircraft covers a spectrum much greater than the audible range. The frequency of sounds from an aircraft range from infrasonic, below the level of auditory sensitivity, to ultrasonic, above the level of human auditory sensitivity. The intensity of all sounds are of concern to me. ***Because I can't hear the frequency at which a sound occurs is not evidence that there isn't any detriment from it.*** We can't see ultraviolet radiation or gamma radiation because they exist beyond our capability to sense them. We are, however very much aware of the physical damage they cause. So it is with sound. The infrasonic impact of the noise event is highly significant.

Take a walk through the Day Square area of East Boston. When a jet aircraft takes off, you are standing below the flight path. The noise that you hear will prevent you from conversing with people you meet on the street. The infrasonic sound has enough power to move parked cars; and motion-sensitive theft alarm systems will be activated. Even if the audible noise were reduced, the power of the infrasonic sound produce by the aircraft in flight would still move the cars and create a collateral impact of audible noise. The alarms continue for 60 to 90 seconds before the automatically reset. Guess what?? In another 90 seconds another jet will take off and this rude and cacophonous event recurs. An increase in aircraft operations will cause an increase in the frequency of the collateral noise events that are now occurring throughout the area. This type of collateral impact on the environment is directly related, not coincidental, and cannot be overlooked as it has thus far. It is also important to acknowledge that just like radiation that we cannot see, sounds we cannot hear can cause humans physical harm. ***Infrasonic frequencies can cause motion and irritation to internal body organs. Infrasonic frequencies can also cause damage to buildings and structures.***

There has been no fair consideration given to the impact on the environment regarding the social injustice of sound abatement programs offered by Massport due to the increased capacity of the airport and the ability of the airport to facilitate the use of New Larger Aircraft (NLA) subsequent to the proposed modifications. 248.6

Window replacement and sound proofing programs are a foolish waste of funds. These programs are socially irresponsible activities that turn citizens into nothing more than prisoners in their homes. An increase in capacity at Logan will render city street, parks, squares, and residential backyard unusable. Community will whither and die; and vacant neighborhoods are a fertile environment for crime.

There has been no fair consideration given to the impact on the environment regarding the economic hardship caused by concentration of activity due to the increased capacity of the airport and the ability of the airport to facilitate the use of New Larger Aircraft (NLA) subsequent to the proposed modifications, as compared to a regional air transportation solution. 248.7

In my opinion the airside improvement project is a mistake that will lead to major economic problems in the future. The recent trends in true urban revitalization that are comprised of a balance of commercial projects and of an increase in urban residency, will halt. The next generation of commercial aircraft is not appropriate for an airport that is situated in a highly populated, residential area of any city. Logan International Airport is simply not able to continue to grow beyond it's current capacity. This airport should be considered fully matured as an operational entity. Acting to enable an increase in capacity of an already over-burdened airport in a fragile, historic Boston neighborhood would be thoughtless and short-sighted. Capital improvements of this nature are not even a Band-Aid solution to the transportation challenges of the future. It is surprising that they would even be considered.

Another airport is required to share the staggering increase of air traffic in the future. Few world class cities operate with only one airport. Paris has four, New York City and Washington, D.C. are served by three. For the New England region and Boston to remain prominent and prosper in the global economy over the next fifty years requires that we all accept the fact that a new, world class regional airport is required. In the near future other means should be implemented to alleviate the over capacity at Logan; expansions of commercial passenger operations at Worcester and Hanscom Field, relocation of cargo operations to Hanscom Field, and Peak-Hour pricing.

Thank you for taking the time to consider my thoughts on these issues. Please contact me if you have any questions about this letter.

Sincerely,

Mark W. Stettler

248.1	Alternatives	Operational Restrictions	There has been no fair consideration given to the impact on the environment due to the increased capacity of the airport and the ability of the airport to facilitate the use of New Larger Aircraft (NLA) subsequent to the proposed modifications.	So-called New Large Aircraft (NLA) carrying up to 1,000 passengers are still just in the discussion phase. No manufacturer has undertaken serious development of such aircraft yet, which would be a multi-year process. These aircraft would probably require modifications to existing airport jetways and apron areas along with increases in taxiway width and turning area. Their use would be limited to extremely high-density markets, and it is not likely that Boston would be among these. In fact, the number of "jumbo jets" serving Logan Airport has declined in recent years. Consequently, the NLA was not included in the Future Fleet scenarios.
248.2	Air Quality	Impacts	There has been no fair consideration given to the impact on the environment regarding air and water pollution due to the increased capacity of the airport and the ability of the airport to facilitate the use of New Larger Aircraft (NLA) subsequent to the proposed modifications.	Implementation of the recommended Airside Project, specifically unidirectional Runway 14/32, would not increase Logan Airport's normal airfield capacity of approximately 120 operations per hour. This capacity is available at Logan Airport approximately 80 percent of the time. Runway 14/32 would allow Logan Airport to maintain this capacity during periods of strong northwest winds that now require controllers to operate on only one or two runways, compared to the typical three-runway configurations used at Logan Airport. So-called New Large Aircraft (NLA) carrying up to 1,000 passengers are still just in the discussion phase. No manufacturer has undertaken serious development of such aircraft yet, which would be a multi-year process. These aircraft would probably require modifications to existing airport jetways and apron areas along with increases in taxiway width and turning area. Their use would be limited to extremely high-density markets, and it is not likely that Boston would be among these. In fact, the number of "jumbo jets" serving Logan Airport has declined in recent years. Consequently, the NLA was not included in the Future Fleet scenarios. Refer to response to Comment 248.1.
248.3	Ground Transportation	Access to Logan	There has been no fair consideration given to the impact on the environment regarding the physical infrastructure of the City of Boston due to the increased capacity of the airport and the ability of the airport to facilitate the use of New Larger Aircraft (NLA) subsequent to the proposed modifications.	Refer to response to Comment 248.1.
248.4	Alternatives	Reduced Minima	There has been no fair consideration given to the impact on the environment regarding the safety and welfare of the affected communities due to the increased capacity of the airport and the ability of the airport to facilitate the use of New Larger Aircraft (NLA) subsequent to the proposed modifications.	The Airside Project analysis is based on alternative 20-year forecasts of operations by aircraft type. Only larger aircraft compatible with the existing facilities at Logan Airport are included in the future forecasts for Logan Airport fleets on which the delay and environmental analyses are based.

248.7	Regional Transportation	Regional Airports	There has been no fair consideration given to the impact on the environment regarding the economic hardship caused by concentration of activity due to the increased capacity of the airport and the ability of the airport to facilitate the use of New Larger Aircraft (NLA) subsequent to the proposed modifications, as compared to a regional air transportation solution.	Refer to response to Comment 248.1.

LETTER 249

April 12, 1999

Mr. Robert Durand Secretary
Of Environmental Affairs
Attention MEPA Office
Mr. Arthur Pugsley - EOEA No 10458
100 Cambridge Street, 20th Floor
Boston, MA 02202

Gentlemen:

RE: "Draft - Environmental Impact Report #10458" Logan Airside Improvement Plan".

This letter is to reaffirm, without qualification, my opposition to the proposed construction of Runway 14/32 and the Centerfield Taxiway at Logan Airport; there are far too many unanswered questions to allow the runways to be built.

I am opposed to this construction for the following reasons:

- more danger due to increased air traffic
- Harbor Island recreational areas will suffer significant noise impact
- no significant decrease in congestion or delays
- a decrease in property values in the impacted communities

After a few modest reductions in the near term, flights and noise will increase for all

The Draft EIS/EIR is Inadequate and request that it is judge so for the following reasons

- Outdated studies and figures were used
- FAA modeling not adhered to
- Lack of alternative studies, i.e. Hanscom, second airport

249.1

All people who live and work in the impacted communities are entitled to " Environmental Justice, protection of their 'Quality of Life" it should not be jeopardized by Massport's proposal. The citizens who reside in the impacted communities currently experience traffic congestion, noise, and a polluted environment, from the planes; automobiles, trucks, busses and other Massport related operations. Health studies have cited increased cases of asthma, breathing problems, and other health problems as a result of the pollution and noise in the impacted communities. If the proposed construction of Runway 14/32 and the Centerfield Taxiway are allowed to be built it will only exacerbate the existing problems we currently endure. The construction of the new runways at Logan Airport does nothing to enhance the quality of the environment, and in truth potentially has the ability to be very destructive.

249.2

My health and the health or the other people who live in the impacted communities are to precious to be jeopardized by Massport's further expansion into our community.

Massport states that the runway will be uni-directional and the planes will fly out over the water.

If the planes fly over the water and an there is an east wind blowing it will cause the fumes to blow back into the communities, rumbling sounds from the planes will bounce off the buildings and impact the communities in a negative way. The FAA web site states that the plan is to construct a new runway 14/32 and extend runways 15-R/33-L and runway 9. There are three runways involved. The FAA would have the final say about what directions for takeoff and landing. 249.3

The Commonwealth must create a comprehensive plan and no further expansion of Logan can be allowed. Please support the impacted community's position and deny MPA " Logan Airside Improvement Plan". 249.4

Sincerely, Clarene Stevens

Code	Topic 1	Topic 2	Comment	Response
249.1	Environmental Review Process	MEPA	The Draft EIS/EIR is inadequate and request that it is judged so for the following reasons: ■ Outdated studies and figures were used ■ FAA modeling not adhered to ■ Lack of alternative studies, i.e., Hanscom, second airport.	In January 2000, in response to the FAA's review of the Draft EIS, the FAA called for preparation of a Supplemental Draft EIS to address specific issues identified by the FAA following input from a SDEIS Panel consisting of six persons. At the FAA's direction, three SDEIS Panel members were appointed by the Governor of the Commonwealth of Massachusetts and three were appointed by the Mayor of the City of Boston. Under the direction of the New England Region FAA, the SDEIS Panel convened in March of 2000 and then met at least monthly with a final meeting in December of 2000. A total of 12 meetings were held. To provide the appropriate background, the SDEIS Panel was presented with an Interim Supplemental Draft EIS, the Airside Project Draft EIS/EIR, answers to key letters written by members of the public, concerned agencies and public officials responding to the Airside Project Draft EIS/EIR, and a series of 15 visual and written presentations from the Project's technical consulting team and other independent industry experts. The Secretary of Environmental Affairs found that "...the Draft Environmental Impact Report (DEIR) submitted on this project adequately and properly complies with the Massachusetts Environmental Policy Act...". Refer to the Certificate of the Secretary of Environmental Affairs on the DEIR, dated May 7, 1999. Consistent with the request made by the EOEA in its Certificate on the Draft EIR, the Supplemental DEIS/FEIR includes delay and environmental analyses for 1998 to reflect current conditions and provide context to the delay problem at Logan Airport. The High and Low Fleet scenarios for 37.5 and 45 million passengers represent a range of possible future activity—both levels and fleet mix—at Logan Airport. A second major airport is not a solution to the current delay and congestion problems at Logan Airport. The Proposed Project to reduce delay and enhance safety at Logan Airport must be implemented in the near term to address current and future operating conditions. Even if a second major airport were to be pursued, the planning period for site selection and environmental review would require ten to 15 years, in addition to a multi-year construction period. Rather, Logan Airport is part of a regional system of airports that includes the T.F. Green/Providence, the Manchester, and the Worcester Regional airports. Service development and increased passenger traffic at these airports are an important part of the region's long-term strategy to accommodate passenger and activity growth. Greater use of the regional airports will provide passengers within the service area of such airports with a viable alternative to Logan Airport. Since demand within Logan Airport's primary service area will remain strong, the improvements at other regional airports will not eliminate the need for airside projects at Logan Airport.

Massdot\DOT466\Docs\Reports\Renumbered Comments and Responses\Private Citizens_1C.doc

Code	Topic 1	Topic 2	Comment	Response
249.2	Alternatives	Runway 14/32	If the proposed construction of Runway 14/32 and the Centerfield Taxiway are allowed to be built, it will only exacerbate the existing problems we currently endure.	The Preferred Alternative is a delay reduction program that promotes the efficiency and safety of airfield operations at Logan Airport. Runway14/32 enhances operating efficiency by providing a third available runway in weather conditions that require northwest-southeast operations. Similar three-runway configurations exist for all other operating directions. Runway 14/32 would not expand the overall capacity of the airport, since Logan Airport's normal operating capacity of 120 operations per hour, which is available approximately 80 percent of the year, is maintained with Runway 14/32. Massport is committed to ensuring that the airfield continues to function as efficiently as possible. The Preferred Alternative achieves this goal responsibly.
249.3	Noise	Impacts	[Even putting more traffic over the harbor would result in air quality, noise and vibration impacts to adjacent communities.]	No alternatives violate the NAAQS. The Preferred Alternative shows better air quality results than the other alternatives. No alternatives violate the NAAQS. The Preferred Alternative shows better air quality results than the other alternatives. Implementation of Runway 14/32 would not result in substantial noise impacts in any community. Rather, it would enable the air traffic controllers to adhere more closely to the PRAS goals and decrease the population that is most severely affected. For example, implementation of the Preferred Alternative will reduce the population affected by Day-Night Sound Level values greater than 70 dB by four percent with the 29 M Low Fleet scenario, by 67 percent with the 37.5 M High Fleet scenario, and by 39 percent with the High Regional Jet Fleet, while increasing the population exposed to Day-Night Sound Level values greater than 65 dB by two percent, zero percent, and three percent for these three fleet scenarios, respectively. Refer to Section 6.2.5 of the Supplemental DEIS/FEIR and population counts presented in Tables 6.2-3 through 6.2-8 of the Supplemental DEIS/FEIR. Noise-induced vibration levels from aircraft, though they may cause rattling, are normally less than footfalls produced by people walking through their own homes.
249.4	Alternatives	Runway 14/32	[Despite Massport's stated intentions, the FAA alone has the authority to designate flight paths and directions for take-off and landing.]	The Runway 14/32 concept under review in the Supplemental DEIS/FEIR allows unidirectional operations only (*i.e.*, all aircraft arrivals would occur over Boston Harbor to the Runway 32 approach and all departures would initiate from the Runway 14 heading out over Boston Harbor). State approval under MEPA and federal approval under NEPA will allow Runway 14/32 to proceed only on a basis consistent with the stated unidirectional limitations. Consistent with any such approvals, Massport will light and stripe Runway 14/32 to accommodate unidirectional operations only. Furthermore, the location of proposed Runway 14/32 involves physical limitations that reinforce the unidirectional requirements of that improvement concept. The Hyatt Hotel and Conference Center, which is 174 feet high, is within 1,300 feet of the Runway 14. The location of the Hyatt Hotel and Conference Center invades applicable FAA approach surface glide slope requirements, thereby precluding arrivals from the west to the Runway 14. Another factor limiting westerly operations on Runway 14/32 is the lack of available facilities to allow aircraft to taxi to the Runway 32. The unidirectional limitations of Runway 14/32 allow maximum use of over-water operations and thereby limit operational impacts over residential areas. To strictly reinforce these important environmental benefits, Massport has designated the intended unidirectional limitation on Runway 14/32 as a mitigation measure. Refer to Section 8.7 of the Supplemental DEIS/FEIR Draft Section 61 Findings, and the discussion in Section 8.5 of the Supplemental DEIS/FEIR regarding enforcement of unidirectionality of Runway 14/32.

LETTER 250

Lauri Webster
192 Gladstone Street
East Boston, MA 02128

April 22, 1999

Robert Durand, Secretary
Executive Office of Environmental Affairs
100 Cambridge Street 20th floor
Boston, MA 02202
RE: Logan Airside Improvement Project

Dear Secretary Durand:

I have always lived in comfortable middle class communities that had great relationships with their community or regional airports. There is always a reason to feel upbeat about these airports-- aviation exhibitions, balloon festivals, glider rides, flying lessons. Airports are the place you go to catch a vacation flight to Florida, or Colorado or France. I love vacations. Airports are also the place you go to catch flights for business trips. I hate business trips. Good for Business, bad for me. And I want to tell you living near an international airport is not so pleasant either, I am afraid.

As I began reading the EIR/EIS, I started compiling my comments and soon realized they would amount to volumes - something too long for me - a wife, a mother and full time professional to research and organize in 60 days. **What I was most struck by, however, was the inability of the data to adequately portray what the impacts of airport operations are really like.** So, I thought I would introduce you to what its like to live near Logan in layman's terms. Let me start by saying that I am shocked that Massport operations have been allowed to reach the level they have... in this country where we possess a certain environmental awareness and environmental laws.

The blast of the engines crescendos to 95 decibels every 90 seconds as each plane takes off. The screeching and squealing make me clench my teeth. Each plane thunders down the runway, shaking the windows in the house, vibrating china in the closet and tilting pictures on the wall. Sometimes this noise goes on for days-- sometimes weeks-- <u>without a break</u>. The noise wakes us up early in the morning and pounds away while we get ready for work. Every night, it destroys the peace when we come home from a long day. It continues until long after 11 PM, preventing us from going to sleep, and more often than reasonable, blasts us out of a sound sleep in the middle of the night. According to Massport's maps, we live *outside the 65 decibel contour.*

We are impacted in this way all during the warmer months when the wind blows from the south. Forget having a cookout on the deck on a sunny afternoon. Its too

uncomfortable to stand out there over the grill. Forget tending a garden. Normal conversation is impossible, even inside the house! Telephone conversations are interrupted, with the other party inquiring, "What is that noise?" There is no relief in listening to music or watching TV because one has to turn up the volume up too high. It makes me irritable and I snap at my three year old. Sometimes, on Sunday nights, my husband and I pack up and *leave* the house just because we can't take the noise anymore!!!

The smell of jet fuel knows no boundaries either. It hits me in the face when I get of the train coming home from work. It follows me up the hill. It is really disappointing when the odor permeates my home. Sometimes, I cannot get away from the smell even by putting my head under my pillow. It is heavenly when the wind blows in a different direction and the smell of the sea cleanses the neighborhood.

Sometimes when the wind comes from a different direction, it just sounds like a hurricane outside. When the wind changes again and peace returns to my neighborhood, it is delightful. Unfortunately, I know the planes are torturing friends in other neighborhoods and surrounding cities and towns. Though the season or time of day may vary, these impacts are experienced by people in every East Boston neighborhood (33,000 people live in East Boston). I know friends in parts of Revere, Winthrop, South Boston and Chelsea that have similar experiences. These neighborhoods of Boston and surrounding towns and cities are ***home*** to more than **120,000 people.**

Then there are the more insidious impacts - things that are harder to prove... effects that take longer to show up or are harder to quantify. Someone told me that there are 70 pounds of particulates released into the air with every take-off and landing. Is this true? Where do the particulates land besides on my window sills and on my clean laundry, which I hang out to dry? How far are they dispersed? What is their impact on our health? Since I have lived in East Boston, I have heard residents wonder out loud about the impact of Logan operations on their health and the health of family and friends. Here is a sample of questions I have heard: Why is there an abnormally high rate of cancer among the older men who belong to the boat club at the end of the runway? Is childhood asthma on the rise in the Town of Winthrop? Is there is cluster of people with neurological disorders in East Boston? Is there a high rate of miscarriage among young women who live and work in East Boston? Is it true that children in flight paths have more difficulties learning? 250.1

How do we quantify the cost of ill health and ignorance? Shouldn' t all this be part of the equation? The report emphasizes over and over the costs to business that the proposed project will alleviate. But what about the costs to our quality of life? Who is going to compensate me for the time I sit in airport related traffic in my own community? How will I be compensated for all the times I cannot go outside to tend to my garden? Who is going to pay me for every day of every year that my property is further devalued by increased airport activity? How can people who 250.2

complain about the poor and working classes being a drag on our nation act to handicap them further? As you can see, I am completely disgusted with Logan International Airport.

Let me try and summarize the rest of my comments on the report:

• Massport and the FAA should be required to lay out for discussion and analysis in detail every computer modeling program referenced, including all assumptions and line by line listing of the individual computer programming commands. Massport has found errors/deficiencies in other computer models before (i.e. how noise travels over water, the "hill" effect...). 250.3

• Massport and the FAA should be required to submit maps that adequately portray the population densities affected by its current and proposed operations. In this report they have manipulated the scale of the maps and the information provided to support their argument, but not necessarily to reflect what really exists or will exist. 250.4

• Massport continually references how much traffic they are directing over the water, which at times makes the reader forget that the "water" is the Boston Harbor, a living resource that we are paying great sums to clean up. We are also trying very hard to establish the Boston Harbor Islands National Park. The impacts to the Harbor should be better quantified. What will be the impact of increased pollution on the eel grass or the harbor seals that have returned to the Harbor. Will the Snowy Owls continue to come? 250.5

• Similarly, Massport's continuous references to how much traffic they are directing over the water belies the fact that taking off over the "water" means that screaming jet engines are both near and facing neighborhoods. Being "behind" blasting engines is as bad as being buzzed by them. This should be fully analyzed. 250.6

• Massport should be required to address impacts to surrounding parks, including Belle Isle Marsh, Piers Park, Memorial Stadium and other smaller East Boston Parks as well as the parks in Winthrop that are in direct flight paths. 250.7

I thank you for your time in considering these comments. I wish I could feel good about our airport and this expansion project, but I do not. I happen to believe that air travel is still in its infancy... that everything about it is going to get bigger and faster, and there is going to be more of it. It seems like we ought to be defining some boundaries and setting some limits. One region can only take so much.

Sincerely,

Lauri Webster

Code	Topic 1	Topic 2	Comment	Response
250.1	Air Quality	Impacts	Someone told me that there are 70 pounds of particulates released into the air with every take-off and landing. Is this true? Where do the particulates land besides on my window sills and on my clean laundry, which I hang out to dry? How far are they dispersed? What is their impact on our health?	The Preferred Alternative will neither incorporate land from nor affect the normal activity or aesthetic value of a public park, recreation area, wildlife refuge, or historic site. In addition, Massport prepares the *Logan Airport Annual Update* and the *EDRs* as part of the review process for the Logan Airport GEIR/ESPR, which presents a series of status updates on conditions and environmental mitigation initiatives at Logan Airport. Massport has carefully planned the airside improvements to reduce delays and improve efficiency without the need for harbor intrusion. Stormwater management will employ Best Management Practices to minimize potential adverse impacts to harbor water quality. No adverse impacts to the Harbor, the Harbor Islands or the surrounding areas are anticipated from this project. Massport employs a GIS mapping system to correlate air quality and odor complaints with meteorology, airport use, and other factors. The soot sampling and monitoring programs indicate that Logan Airport is a very small (*i.e.*, less than one percent) contributor. In addition, the NAAQS serve as an indicator of the acceptability of current pollutant concentrations since these standards were designed to protect human health and welfare. Dispersion modeling indicates no violations of the NAAQS.
250.2	Public Health	Effects	How do we quantify the cost of ill health and ignorance? Shouldn't all this be part of the equation? The report emphasizes over and over the costs to business that the proposed project will alleviate. But what about the costs to our quality of life?	In January 1996, Massport reviewed available public health data, including mortality and morbidity from each neighborhood in Boston and cancer incidence data available from the Massachusetts Department of Public Health. These data indicated that causal relationships cannot be determined at this time. A review of the 1999 *Report to the Mayor, Health of Boston* prepared by the Boston Public Health Commission leads to a similar conclusion. In addition, Massport has shared the results of the *Soot Deposition Study* with public health agencies and is cooperating with the Harvard School of Public Health on the *South Boston Particle Source Apportionment Study.*
250.3	Analysis Assumptions/ Methodologies	Passenger Forecasts	Massport and the FAA should be required to lay out for discussion and analysis in detail every computer modeling program referenced, including all assumptions	All operational and environmental models used in the Airside analysis are approved for use in this EIS/EIR. The FLAPS, DELAYSIM, and Airport Machine models used for the operational analysis were reviewed and approved by the FAA and are discussed in Chapter 4 of the Supplemental Draft EIS/Final EIR. The noise analysis is based on the FAA approved INM model, which is discussed in Chapter 6. The air quality analysis is based on FAA, EPA, and MDEP models and guidelines, which are discussed in Chapter 6. Please refer to the technical appendices in the Draft EIS/Draft EIR and the Supplemental DEIS/FEIR for detailed modeling assumptions.

Code	Topic 1	Topic 2	Comment	Response
250.4	Environmental Justice	Demographic Data	Massport and the FAA should be required to submit maps that adequately portray the population densities affected by its current and proposed operations. In this report they have manipulated the scale of the maps and the information provided to support their argument, but not necessarily to reflect what really exists or will exist.	The estimated population within the 65 dB and 60 dB DNL noise contours for the No Action and Preferred Alternatives is presented for each of the communities within the study area in Tables 6.8-3 through 6.8-8 of the Supplemental DEIS/FEIR. Figures 6.8-1 and 6.8-2 of the Supplemental DEIS/FEIR provide information on the distribution of median household income and minority populations within the study area.
250.5	Ecosystems	Wetlands	The impacts to the Harbor should be better quantified. What will be the impact of increased pollution on the eel grass or the harbor seals that have returned to the Harbor. Will the Snowy Owls continue to come?	No work is proposed in Boston Harbor.
250.6	Noise	Runway Use	...Massport's continuous references to how much traffic they are directing over the water belies the fact that taking off over the "water" means that screaming jet engines are both near and facing neighborhoods. ... This should be fully analyzed.	The operations of Proposed Runway 14/32 would be over the water. The departures on Runway 14 would turn over the inner harbor and proceed out the harbor mouth, as do the departures on Runway 15R, the nighttime preferential runway. Similarly, the last several miles of the approach path to Runway 32 would be over water and largely uninhabited islands. When Runway 14/32 is in operation, it would reduce the noise exposure over populated communities.
250.7	Open Space/ Parkland	Section 4(f)	Massport should be required to address impacts to surrounding parks, including Belle Isle Marsh, Piers Park, Memorial Stadium and other smaller East Boston Parks as well as the parks in Winthrop that are in direct flight paths.	Monitoring of airborne soot levels in the vicinity of Logan Airport have shown that the airport is a very small (less than one percent) contributor to ambient levels. In addition, Nitrogen Oxides emissions associated with the Airside Project are lower, when compared to the No Action Alternative. Construction and operational controls will be implemented to ensure that any potential impacts to natural resources are minimized. In general, these will include a construction soil erosion and sediment control plan, a stormwater management plan and the use of Best Management Practices (BMPs) for daily airfield operations.

LETTER 251

225 Webster Street
East Boston, Mass.
April 21, 1999

Dear Mr. Pugsley,

This is a letter of opposition to the Airside Expansion proposal by the Mass. Port Authority the proposed new runway and the centerfield taxiway would have very adverse impacts on my neighborhood and adjoining neighborhoods.

The proposed new runway would cause three times the present take-offs on Runway 27. It would also triple the departures on Runway 33. The neighborhoods, cities and towns under and near these flight tracks already have

251.1 too much noise. To triple the noise exposure for these residential communities is not acceptable.

In my neighborhood, Jeffries Point, the noise microphone at Jeffries Yacht Club registers noise levels above 65 d.b. most days of the month. Yet the noise contours does not extend beyond the B.I.F. boundary of the

251.2 airport. Relying on the computer model to describe the noise exposure and impact on neighborhoods is not acceptable. Real measurement of noise via the microphone would give a more accurate description.

In my opinion this way of measuring the noise with a computer model is a flaw and distorts the noise experience of people impacted by
251.2 airport operations. A new study using the
(cont.) real noise readings to determine noise impacts is necessary.

Take-offs on a proposed new runway would impact Jeffries Point heavily. The take-off roar would increase the low-frequency noise very much. We in Jeffries Point already suffer a great deal from the take-offs on Runway 9. The taxiing noise and the extremely loud roar and rumble shake the very foundations of our homes and cause everyday living to be interrupted till the take-off is completed. But then, a minute later another take-off starts and causes the same impact and life disruption. These existing impacts must
251.3 be addressed and mitigated before the Port Authority thinks about any new expansion proposals.

The proposed centerfield taxiway would
251.4 cause more impacts of noise and pollution. More airplanes under power would be lined up between the 4/22's at the same time as other planes would be lined up on existing taxiways. In my opinion this would allow

a large increase in capacity for the airport. And the increase in noise and air pollution for the nearby neighborhoods of Orient Heights and Winthrop would be awful.

The state, the F.A.A., the E.P.A. and
251.5 any other agency involved in future planning for transportation must take a broader, regional look at transportation needs and solutions. Since the present proposal was done, several regional changes have begun to happen. The airport in Rhode Island, T.F. Green and the Manchester airport have begun new services which take passengers and operations away from Logan. In addition, Pease A.F.B. in New Hampshire has proposed new operations there. Also the new N.E. corridor rail service between Boston, New York and Washington will take passengers away from the airlines when the travel time is greatly reduced with higher speed trains.

In addition, airline delays have decreased since 1993. This delay reduction must be factored into the present situation. And management techniques such as peak hour pricing must be given a chance to

demonstrate the effectiveness at reducing delay before any expansion is approved for the airport. In fact the Chairman of the Board of Directors of the Port Authority agreed to do peak hour pricing as a delay reduction technique before considering airside expansion. But right after the November election for Governor the expansion proposal was taken off the shelf and the agreement was forgotten by the Chairman.

251.6 The Draft E-IR does not address health impacts from airport operations. In fact the neighborhoods in Boston have the highest asthma, emphysema and respiratory infection levels in the state. These conditions are aggravated by plane and car fumes.

251.7 Lowering of the minimums on landings will allow more aircraft to attempt landings in bad weather conditions. This, too, will impact close-in communities. The impact is not only in quantity of operations, but in safety issues as well. If a plane cannot land and attempts to abort, people are afraid that there is more potential for accidents near the airport. If, for instance, a plane cannot land and attempts to turn around and gain altitude quickly, people

are afraid that some planes won't be able to gain altitude fast enough to execute a missed approach and the plane will crash. This sentiment is heard often in the Bayswater St. area and in Belmont.

In the context of environmental justice, it is most unfair to concentrate the impacts and
251.8 burden of airline travel and airport expansion on the people in working class neighborhoods who already bear the burden of significant noise and air pollution. The current impacts must be mitigated by those responsible. And a more far reaching, regional planning approach to solving the transportation issues must be put in place.

Increasing the capacity and use of
251.9 underutilized airports, using peak hour pricing, siting a new airport, reducing the impacts of the present air traffic and creating a night curfew are all things that must be considered before considering an airside expansion project.

I must stress how important I believe it is that the FAA and the

Port Authority change the way they measure noise from aircraft on the ground and in the air. Our real life, daily experience must be taken into account. The actual measurements from the microphones are more descriptive of the impacts than the
251.10 computer models. More microphones need to be put out in the neighborhoods and cities and towns. The noise contours need to be redrawn to reflect the real noise effects.

To misrepresent the noise impacts on people is devious in my opinion. Agencies that use public money should not be in the business of misrepresenting the effects of their proposals. And they shouldn't be misrepresenting other technical data to make a case for their proposals. This is dishonest.

Martin Luther King Jr. said,
" There comes a time when people get tired of being plunged into the abyss of exploitation and nagging injustice."
I and all other people impacted by the environmental injustice of airport expansion are tired of being exploited. For this

and for all the reasons stated in this letter and in the technical comments from the Community Advisory Committee consultants, I ask that this draft E.I.R. be found inadequate.

Sincerely,

Mary Ellen Feld

251.1	Noise	Impacts	The neighborhoods, cities and towns under and near these flight tracks already have too much noise. To triple the noise exposure for those residential communities is not acceptable.	The goals of the Airside Project are to reduce delay, increase airport efficiency, and reduce negative environmental impacts. The Preferred Alternative, and specifically unidirectional Runway 14/32, would not increase Logan Airport's normal airfield capacity of approximately 120 operations per hour. This capacity is available at Logan Airport approximately 80 percent of the time. Runway 14/32 would allow Logan Airport to maintain this capacity during periods of strong northwest winds that now require controllers to operate on only one or two runways, compared to the typical three-runway configurations used at Logan Airport. The runway will not increase Logan Airport's normal operating capacity, nor will it encourage or induce an increase in aircraft operations. The Preferred Alternative, and specifically unidirectional Runway 14/32, would not increase Logan Airport's normal airfield capacity of approximately 120 operations per hour. This capacity is available at Logan Airport approximately 80 percent of the time. Runway 14/32 would allow Logan Airport to maintain this capacity during periods of strong northwest winds that now require controllers to operate on only one or two runways, compared to the typical three-runway configurations used at Logan Airport. The runway will not increase Logan Airport's normal operating capacity, nor will it encourage or induce an increase in aircraft operations. The Preferred Alternative, and specifically unidirectional Runway 14/32, would not increase Logan Airport's normal airfield capacity of approximately 120 operations per hour. This capacity is available at Logan Airport approximately 80 percent of the time. Runway 14/32 would allow Logan Airport to maintain this capacity during periods of strong northwest winds that now require controllers to operate on only one or two runways, compared to the typical three-runway configurations used at Logan Airport. The runway will not increase Logan Airport's normal operating capacity, nor will it encourage or induce an increase in aircraft operations. Although safety is the first consideration of any proposed alternative at Logan Airport, this data were not relevant to the Airside Study. However, such questions can be answered by contacting the public affairs offices of the FAA or Massport.

Code	Topic 1	Topic 2	Comment	Response
251.2	Noise	Model	Relying on the computer model to describe the noise experience and impact on neighborhoods is not acceptable. Real measurement of noise via the microphone would give a more accurate description. ... A new study using the real noise readings to determine noise impacts is necessary.	Differences between measured and modeled sound levels have been reported in Logan Airport's various GEIRs and Annual Updates for a number of years. Differences at close-in locations were significantly reduced in 1996 through modification of source levels to better account for over-water sound propagation and apparent use of higher engine power settings than are normally assumed in the noise model's database (Refer to Appendix F of the *Logan Airport 1996 Annual Update).* In 1998, differences between measured and modeled noise became even less when Massport upgraded its monitoring system and began to report noise caused only by aircraft -- a metric directly comparable to the DNL exposure levels predicted by the noise model. At sites having exposure levels of 60 dB or more, this improvement to the monitoring system brought measured and modeled DNL values to within 0.2 dB of each other. (Refer to Chapter 5 of the *Logan Airport 1998 Annual Update*). Massport continues to investigate possible causes for remaining differences (such as from hill effects) but believes the FAA's INM noise model used in the Airside Project noise analyses accurately represents expected noise exposure. Using results from a special study of Terrain Modeling analysis ("hill effects") in Orient Heights and Jeffries Point, Massport applied for and received approval to apply a correction to 1999 contours to account for increased levels in Orient Heights.
251.3	Noise	Impacts	The existing [noise and vibration] impacts must be addressed and mitigated before the Port Authority thinks about any new expansion proposals.	Implementation of Runway 14/32 would not result in substantial noise impacts in any community. Rather, it would enable the air traffic controllers to adhere more closely to the PRAS goals and decrease the population that is most severely affected. For example, implementation of the Preferred Alternative will reduce the population affected by Day-Night Sound Level values greater than 70 dB by four percent with the 29 M Low Fleet scenario, by 67 percent with the 37.5 M High Fleet scenario, and by 39 percent with the High Regional Jet Fleet, while increasing the population exposed to Day-Night Sound Level values greater than 65 dB by two percent, zero percent, and three percent for these three fleet scenarios, respectively. Refer to Section 6.2.5 of the Supplemental DEIS/FEIR and population counts presented in Tables 6.2-3 through 6.2-8 of the Supplemental DEIS/FEIR. Noise-induced vibration levels from aircraft, though they may cause rattling, are normally less than footfalls produced by people walking through their own homes.
251.4	Alternatives	Taxiway Improvements	[The proposed centerfield taxiway would allow more planes to line up, waiting to take off, increasing capacity for the airport and causing an increase in air and noise pollution.]	Reducing the current landing minimums for Runways 15R, 22L, and 27 at Logan Airport will not increase noise levels. Aircraft will follow the same arrival paths, at the same altitudes as today, but the location at which a missed approach decision must be made will be moved closer to the airport. Since missed approaches rarely occur, they have no discernible effect on the cumulative noise. For example, reducing the Runway 22L decision height to 200 feet moves the maximum noise point to approximately 3,000 feet from touchdown which is further from populated areas in East Boston than the current maximum noise point. Although categorically excluded from NEPA review, modeling of the changes in runway availability from reductions in the approach minimums and an analysis of the potential impacts on community noise exposure that may result were included in the Airside Project in compliance with an earlier agreement among Massport, the FAA and the City of Boston.

Code	Topic 1	Topic 2	Comment	Response
251.5	Regional Transportation	Regional Airports	The state and the FAA, the EPA and [the state agencies] for transportation must take a broader, regional look at transportation needs and solutions.	Massport has been engaged in cooperative regional planning with the FAA, regional airports, and state transportation agencies for a number of years. For example, in November 1999, Massport and Governor Cellucci sponsored a Regional Transportation Summit that involved the New England Governors, transportation officials, and business leaders. The summit focused on joint marketing among the New England commercial service airports and the joint promotion of rail and road initiatives that will foster an efficient and balanced regional transportation system. Refer to Chapter 2 of the Supplemental DEIS/FEIR for a comprehensive discussion of Massport's regional transportation planning initiatives.
251.6	Public Health	Effects	The Draft EIS/R does not address health impact from airport operations.	In January 1996, Massport reviewed available public health data, including mortality and morbidity from each neighborhood in Boston and cancer incidence data available from the Massachusetts Department of Public Health. These data indicated that causal relationships cannot be determined at this time. A review of the 1999 *Report to the Mayor, Health of Boston* prepared by the Boston Public Health Commission leads to a similar conclusion. In addition, Massport has shared the results of the *Soot Deposition Study* with public health agencies and is cooperating with the Harvard School of Public Health on the *South Boston Particle Source Apportionment Study.*
251.7	Alternatives	Reduced Approach Minima	Lowering of the minimums on landings will allow more aircraft to attempt landings in bad weather conditions. This, too, will impact close-in communities.	Reducing the current landing minimums for Runways 15R, 22L, and 27 at Logan Airport does not equate to a reduction in the existing levels of safety and doesn't change noise levels. Aircraft would follow the same arrival paths, at the same altitudes as today, but the location at which a missed approach procedure would be initiated would be moved closer to the airport. Since missed approaches rarely occur, they have no discernible effect on the cumulative noise such as the Day-Night Sound Level (DNL), but are rather single aircraft events. The noise from a missed approach is at maximum value just after engine thrust has been increased for the climb-out. Reducing the Runway 22L decision height to 200 feet, for example, this maximum noise occurs approximately 3,000 feet from touchdown and further from populated areas in East Boston and Winthrop that is currently the case. Ideally, whenever possible, the lowest minimums are used to ensure the greatest availability of a runway during poor weather . Although normally categorically excluded from the NEPA review, the Airside Project study included modeling of changes in runway availability due to reductions in the approach minimums and an analysis of the potential impacts on community noise exposure that may result.

Code	Topic 1	Topic 2	Comment	Response
251.8	Environmental Justice	Impacts	...it is most unfair to concentrate the impacts and burden of airline travel and airport expansion on the people in working class neighborhoods who already bear the burden of significant noise and air pollution.	Adverse impacts are not predominately borne by low-income or minority populations. Only 21 percent of the population within the 65 dB DNL contour for the Preferred Alternative is minority, compared to the Suffolk County minority population of 38 percent. Less than two percent of the population within the 65 dB DNL contour for the Preferred Alternative has a household income less than 150 percent of poverty level. The additional area within the 65 dB DNL noise contour associated with the Preferred Alternative includes a predominately Hispanic neighborhood in Chelsea which is predicted under worst case assumptions to experience an increase of 0.6 dB or less. Under FAA standards, this change is not a significant adverse impact. The minority and low-income populations in South Boston and East Boston affected by the Preferred Alternative 65 dB DNL contour are almost identical to the No Action Alternative. The 65 dB DNL contour for the Preferred Alternative does not extend into Jamaica Plain, Roxbury and the South End. Mitigation of the increased noise within the 65 dB DNL contour will be provided to affected communities in the form of residential sound insulation. The existing flight tracks at Logan Airport have been developed over a long period of time with community consultation and provide the best combination meeting both airport requirements and community needs. The redesign of existing flight tracks was not included as a part of the Airside Project. The only new tracks proposed in the Airside Project Draft EIS/EIR are for Runway 14/32 and are over water.
251.9	Regional Transportation	Regional Airports	Increasing the capacity and use of underutilized airports, using peak-hour pricing, siting a new airport, reducing the impacts of the present air traffic and creating a night curfew are all things that must be considered before considering an airside expansion project.	Because the development of a second major airport would require ten to 15 years for site selection and environmental review, in addition to a multi-year construction period, this option is not viewed as a solution to accommodating forecast demand over the next 20 years. Service developments at other surrounding airports, including Manchester Airport, T.F. Green/Providence Airport and Worcester Regional Airport, preclude the need for a second major airport. The available public health studies for communities adjacent to Logan Airport were reviewed and are presented in Section 6.8.7 of the Supplemental DEIS/FEIR.

Code	Topic 1	Topic 2	Comment	Response
251.10	Noise	Monitoring	...the actual measurements from the microphones are more descriptive of the impacts than the computer models. ... The noise contours need to be redrawn to reflect the real noise effects.	Differences between measured and modeled sound levels have been reported in Logan Airport's various GEIRs and Annual Updates for a number of years. Differences at close-in locations were significantly reduced in 1996 through modification of source levels to better account for over-water sound propagation and apparent use of higher engine power settings than are normally assumed in the noise model's database (Refer to Appendix F of the *Logan Airport 1996 Annual Update).* In 1998, differences between measured and modeled noise became even less when Massport upgraded its monitoring system and began to report noise caused only by aircraft -- a metric directly comparable to the DNL exposure levels predicted by the noise model. At sites having exposure levels of 60 dB or more, this improvement to the monitoring system brought measured and modeled DNL values to within 0.2 dB of each other. (Refer to Chapter 5 of the *Logan Airport 1998 Annual Update*). Massport continues to investigate possible causes for remaining differences (such as from hill effects) but believes the FAA's INM noise model used in the Airside Project noise analyses accurately represents expected noise exposure. Using results from a special study of Terrain Modeling analysis ("hill effects") in Orient Heights and Jeffries Point, Massport applied for and received approval to apply a correction to 1999 contours to account for increased levels in Orient Heights. Also, measurements can only report on the noise that is occurring, not on what may occur under a future scenario. Therefore, it is necessary to use the calculated contour methodology to examine noise from various future scenarios.

LETTER 252

April 12, 1999

Robert Durand
Secretary of Environmental Affairs
100 Cambridge Street, 20th Floor
Boston, MA 02202

Dear Sir:

I strongly oppose the expansion of ***Runway 14/32*** and the ***Center Strip Taxiway***.

The noise from incoming planes has impacted my family's quality of life for years, (especially in summer months when trying to sit out in back yard, or having friends over for cookout, the noise is annoying), you only have to check up on the complaints I have made.

There are other ways to satisfy our region's transportation needs such as the utilization of other airports. 252.1

Sincerely,

Olympia Mastrocola

252.1	Regional Transportation	Regional Airports	There are other ways to satisfy our region's transportation needs such as the utilization of other airports.	Chapter 2 of the Supplemental DEIS/FEIR provides a discussion of the specific role played by the regional transportation alternatives and steps that Massport has taken to foster use of these alternatives. Massport has long recognized and has been a proponent of options to Logan Airport. Together with the regional airports, Massport has implemented a regional strategy to enhance the use of options to Logan Airport. In the Draft EIS/EIR, Massport identified up to 7.3 million annual passengers that could be absorbed by regional alternatives that include use of T.F. Green/Providence, Manchester and Worcester Regional airports, as well as the new high-speed rail to New York. In the Supplemental DEIS/FEIR, Massport recognizes that these developments will slow Logan Airport's passenger traffic growth. Logan Airport may not achieve the 37.5 million passenger forecasts until after 2010, but rather closer to 2015, and the 45 million passenger forecasts may not be achieved until after 2020. While regional alternatives can play an important role in reducing the rate of future traffic growth at Logan Airport, they do not address Logan Airport's inability to efficiently accommodate current levels of demand during northwest wind conditions. Runway 14/32, which is designed to correct the problem with Logan Airport's layout, is necessary to correct this deficiency and provides clear benefits at current aircraft traffic levels. These benefits will only increase in the future, even as developments at the regional airports act to reduce the rate of future growth at Logan Airport.

253.1	Environmental Review Process	MEPA	The agreements of 1987 between Massport and the Massachusetts Executive Office of Environmental Affairs were to limit growth at Logan in a way that would maintain impacts at or below 1987 levels. The current request for runway expansion violates this commitment and should be opposed by EOEA.	Massport disagrees. For all the alternatives, the Airside Project analysis determined that the noise-affected populations, in both 1999 and in future years, are well below the cumulative noise exposed populations that existed in 1987.

LETTER 254 The Townsend Hotel

April 19, 1999

Secretary of Environmental Affairs
MEPA office

Dear Secretary Bagsley:

I am writing to express vehement opposition to expanding Logan airport by building runway 14/32.

In my view, lifting the ban on Logan expansion will create new problems where none now exist. To begin with, Logan airport
254.1 will never be large enough or accessible enough to solve the region's transportation problems. Furthermore, Runway 14/32 would dramatically increase traffic over
254.2 Hingham and other south shore communities. In addition to the human aspects of noise pollution, disturbance of the

nesting patterns of the swans and other migratory waterfowl is inevitable & live on conservation land and these planes fly directly overhead in their approach to runway 32 currently Dramatically increasing this traffic will

254.3 damage the quality of life for all species in the planes' path.

Finally, there is a question of honesty on Massport's part. They have

254.4 stated in public that increased traffic to runway 14/32 would be over water. This is not true. Come to my house when the wind is right and the answer will be evident as to this question.

Sincerely,

Robert F. Belknap III
12 Ringbolt Rd (Belknap
Hingham MA 02043

Letter 254

Private Citizens: Hingham

Code	Topic 1	Topic 2	Comment	Response
254.1	Regional Transportation	Regional Airports	...Logan Airport will never be large enough or accessible enough to solve the region's transportation problems.	Developments at the regional airports and their impacts on Logan Airport are described in Sections 2.3 to Section 2.6 of the Supplemental DEIS/FEIR. Massport considers Logan Airport to be part of a regional system of airports that includes T.F. Green/Providence, Manchester, and Worcester Regional airports. Massport has long recognized that service development and increased passenger traffic at these airports are an important part of the region's long-term strategy to accommodate passenger and activity growth. Massport has actively encouraged the development of these regional airports. Greater use of the regional airports will provide passengers within the service area of such airports with a viable alternative to Logan Airport. Since demand within Logan Airport's primary service area will remain strong, the improvements at other regional airports will not eliminate the need for airside projects at Logan Airport.
254.2	Alternatives	Runway 14/32	...Runway 14/32 would dramatically increase traffic over Hingham and other South Shore communities.	The Supplemental DEIS/FEIR projects that the Preferred Alternative will promote runway use in a manner that is more consistent with annual PRAS goals. Total arrivals to Runway 33L and 32 would increase with construction of the Runway 14/32, but this arrival flight path is primarily over water. This runway operating direction is currently running well below the PRAS goal of 42.3 percent, and the unidirectional Runway 14/32 would allow the controllers to approach but still remain below the annual goal for Runway 33 arrivals. The PRAS goals were established based on a thorough public participation process in response to community noise concerns.
254.3	Ecosystems	Rare Species	...disturbance of the nesting patterns of the swans and other migratory waterfowl is inevitable...Dramatically increasing [air] traffic would damage the quality of life for all species in the planes' path.	The Preferred Alternative is a delay reduction program that promotes the efficiency and safety of airfield operations at Logan Airport. Runway14/32 enhances operating efficiency by providing a third available runway in weather conditions that require northwest-southeast operations. Similar three-runway configurations exist for all other operating directions. Runway 14/32 would not expand the overall capacity of the airport, since Logan Airport's normal operating capacity of 120 operations per hour, which is available approximately 80 percent of the year, is maintained with Runway 14/32. Massport is committed to ensuring that the airfield continues to function as efficiently as possible. The Preferred Alternative achieves this goal responsibly.

Code	Topic 1	Topic 2	Comment	Response
254.4	Alternatives	Runway 14/32	They have stated in public that increased traffic to runway 14/32 would be over water. This is not true.	Refer to Section 8.7 of the Supplemental DEIS/FEIR Draft Section 61 Findings, and the discussion in Section 8.5 of the Supplemental DEIS/FEIR regarding enforcement of unidirectlionality of Runway 14/32. The unidirectional limitations of Runway 14/32 allow maximum use of over-water operations and thereby limit operational impacts over residential areas. To strictly reinforce these important environmental benefits, Massport has designated the intended unidirectional limitation on Runway 14/32 as a mitigation measure. We anticipate that any state and federal approvals will also strictly reinforce the unidirectional limitations intended for Runway 14/32. The significant noise exposure from Runway 14/32 occurs over water in Boston Harbor. Even the Day-Night Sound Level 60 dB contour, which extends less than six miles from the runway, is over water. The DNL on the south shore of the harbor at 9 miles from the runway should be less, on the order of 55 dB, which was chosen by the United States EPA as the environmental noise level required to protect public health and welfare with an adequate margin of safety.

LETTER 255

17 Ringbolt Rd.
Hingham, MA. 02043
April 21, 1999

Secretary of Environmental Affairs
attn.: MEPA Office
Mr. Arthur Pugsley - EOEA No. 104
100 Cambridge St. 20th fl.
Boston, MA. 02205

Dear Secretary Pugsley,

We are opposed to the lifting of the ban on expansion of Logan Airport and to the construction of Runway 1432 for the following reasons:

1. Runway 1432 will not solve the problem of Logan's inadequacy as a site. 255.1

2. Regional solutions have not been given adequate consideration. For example, we find that door to door travel time from Hingham to T.F. Greene Airport in Rhode Island is about equal to that to Logan. 255.2

3. Runway 1432 would not be strictly over the water. We are located 9 miles from Logan directly in the glide path and already subject to excessive noise when Runway 33L is in use. 255.3

We request a delay of the construction of Runway 1432 until alternatives are adequately explored.

Sincerely,

Charles W. Berry
Susan B. Berry

Letter 255
Charles and Susan Berry
Private Citizens: Hingham

Code	Topic 1	Topic 2	Comment	Response
255.1	Alternatives	Runway 14/32	Runway 14/32 will not solve the problem of Logan's inadequacy as a site.	Logan Airport is currently one of the most delay-prone airports in the country, and Massport is striving to achieve the best performance possible from the existing airport site. The benefits of Runway 14/32 are significant: (1) it provides a third runway for operations during northwest winds; (2) it reduces total annual delay by 21 to 35 percent (Alt. 1A vs. Alt. 4); (3) it reduces delays during VFR conditions by 47 to 69 percent (Alt. 1A vs. Alt. 4); (4) it allows controllers to separate aircraft of differing size classes during northwest winds; and (5) it increases the controllers' ability to achieve PRAS goals.
255.2	Regional Transportation	Regional Airports	Regional solutions have not been given adequate consideration.	Logan Airport is part of a regional system of airports that includes T.F. Green/Providence, Worcester Regional and Manchester airports. Massport has long recognized that service development and increased passenger traffic at these airports are an important part of the region's long-term strategy to accommodate passenger and activity growth. Massport has actively encouraged the development of regional airports and use of other options, including high-speed rail to Logan Airport's largest market, New York. Regional service was examined in Chapter 2 of the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR. This analysis supports the conclusion that greater use of the regional airports will provide passengers within the service area of such airports with a viable alternative to Logan Airport. Since demand within Logan Airport's primary service area will remain strong, the improvements at other regional airports will not eliminate the need for airside projects at Logan Airport.
255.3	Alternatives	Runway 14/32	Runway 14/32 would not be strictly over the water. We are located 9 miles from Logan, directly in the glide path and already subject to excessive noise when Runway 33L is in use.	The significant noise exposure from Runway 14/32 occurs over water in Boston Harbor. Even the Day-Night Sound Level 60 dB contour, which extends less than six miles from the runway, is over water. The DNL on the south shore of the harbor at 9 miles from the runway should be less, on the order of 55 dB, which was chosen by the United States EPA as the environmental noise level required to protect public health and welfare with an adequate margin of safety.

LETTER 256

JAMES B. CONROY
28 CROYDON RD.
HINGHAM, MASS. 02043

April 18, 1999

Secretary of Environmental Affairs
Attn: MEPA Office
Mr. Arthur Pugsley - EOEA No. 10
100 Cambridge St
Boston, MA 02205

Dear Mr. Pugsley:

As 17-year residents of the Wompatuck End area of Hingham, my wife and children and I have endured a growing parade of air traffic nearly directly overhead, which began as a relatively modest concern but has steadily grown in recent years. The proposed new runway at Logan would dramatically increase that noise pollution, for the sake of expanding traffic at a transportation bottleneck that is already full.

Please record our strong opposition to this plan, on grounds of sight

256.1

fairness as well as sound environmental policy and urban planning. Higham and surrounding communities will be adversely impacted by the new runway to an extent that cannot be justified by the untenable arguments on the other side.

Sincerely,

Jane Long

256.1	Alternatives	Runway 14/32	The proposed new runway at Logan would dramatically increase that noise pollution, for the sake of expanding traffic at a transportation bottleneck that is already full.	In Hingham DNL levels from Logan Airport overflights are on the order of 55 dB or less, some 20 dB below the highest exposure levels experienced by communities much closer to Logan Airport.

LETTER 257

28 Croydon Road
Hingham, MA 02043
April 18, 1999

Secretary of Environmental Affairs
Attention: MEPA Office
Mr. Arthur Pugsley-EOEA No. 10
100 Cambridge Street
20th Floor
Boston, MA. 02205

Dear Mr. Pugsley:

I don't believe I can adequately describe the complete sense of dismay I felt when I happened upon the diagram in the March 2, 1999, *Boston Globe,* showing the effect Runway 14/32 would have on the Town of Hingham. Prior to this, I was not even aware that Massport wanted to accommodate more flights into Logan. Really, it never even entered my mind that an expansion would even be considered, adding more traffic both in the air and on the ground to the mass of congestion we know as the City of Boston. At first, I believed the diagram must be in error. I thought that if Hingham were to be impacted by the runway, certainly the town would be made aware of the situation and state and federal studies would be done to assess its impact on our quality of life. So I allayed my fears until further articles in the *Globe* made it clear that indeed Hingham would be severely affected. Massport hadn't even considered the effects on Hingham. 257.1 257.2

Sometimes the noise is so bad here that indoor telephone conversations must be interrupted while a plane passes overhead. But, while certainly stressful, the knowledge that when the wind direction changes so will the flight path makes the noise tolerable. However, the proposed 150% increase in flights would result in fewer, if any, periods of quiet. 257.3

Please consider the significant impact on the quality of life in Hingham and other communities surrounding Logan and reject this proposal.

Sincerely,

Lynn Conroy

Code	Topic 1	Topic 2	Comment	Response
257.1	Alternatives	Demand	I was not aware that Massport wanted to accommodate more flights into Logan...[This expansion would add] more traffic both in the air and on the ground...	The Preferred Alternative, and specifically unidirectional Runway 14/32, would not increase Logan Airport's normal airfield capacity of approximately 120 operations per hour. This capacity is available at Logan Airport approximately 80 percent of the time. Runway 14/32 would allow Logan Airport to maintain this capacity during periods of strong northwest winds that now require controllers to operate on only one or two runways, compared to the typical three-runway configurations used at Logan Airport. The runway will not increase Logan Airport's normal operating capacity, nor will it encourage or induce an increase in aircraft operations.
257.2	Environmental Review Process	Public process	I thought if Hingham were to be impacted by the runway...[they] would be made aware of the situation...Massport hadn't even considered the effects on Hingham.	In Hingham DNL levels from Logan Airport overflights are on the order of 55 dB or less, some 20 dB below the highest exposure levels experienced by communities much closer to Logan Airport.
257.3	Noise	Impacts	...while certainly stressful, the knowledge that when the wind direction changes so will the flight path makes the noise tolerable. However, the proposed 150% increase in flights would result in fewer, if any, periods of quiet.	The Preferred Alternative is a delay reduction program that promotes the efficiency and safety of airfield operations at Logan Airport. Runway14/32 enhances operating efficiency by providing a third available runway in weather conditions that require northwest-southeast operations. Similar three-runway configurations exist for all other operating directions. Runway 14/32 would not expand the overall capacity of the airport, since Logan Airport's normal operating capacity of 120 operations per hour, which is available approximately 80 percent of the year, is maintained with Runway 14/32. Massport is committed to ensuring that the airfield continues to function as efficiently as possible. The Preferred Alternative achieves this goal responsibly.

LETTER 258

Edward H. D'Alelio

Hingham, Massachusetts 02043

April 21, 1999

Secretary of Environmental Affairs
Attention: MEPA Office
Mr. Arthur Pugsley – EOEA No. 10
100 Cambridge St., 20th floor
Boston, MA 02205

RE: Opposition to Runway 14/32

Dear Mr. Pugsley:

As a family resident of Ringbolt Farm in Hingham, I am strongly opposed to Runway 1432. The existing noise from aircraft is excessive on my family, beginning in earnest at 4:00 a.m. every morning. It is disruptive to my family, especially my young children who are awakened from sleep. 258.1

I am a frequent business traveler. I have observed no delays in my airline schedule and see no need for further airline expansion. If Massport wants to ease delays, they should expedite baggage retrieval. Logan is by far the worst-performing airport in the country on baggage retrieval. 258.2

Again, I strongly oppose further expansion of Runway 1432. It is unneeded, a costly waste of taxpayer money, and a serious aggravation in potential noise pollution.

Sincerely,

Edward H. D'Alelio

Letter 258

Code	Topic 1	Topic 2	Comment	Response
258.1	Noise	Nighttime Noise	The existing noise from aircraft is excessive on my family, beginning in earnest at 4:00 AM every morning. It is disruptive to my family, especially my young children who are awakened from sleep.	The Night Equivalent Sound Level (LeqN) was calculated at 23 selected locations for all fleets and scenarios. Tables 6.2.8 and 6.2.9 of the Supplemental DEIS/FEIR report these data for the 29M Low and 37.5M High Fleet scenarios of the Supplemental DEIS/FEIR. The results show that, at most locations, the LeqN for the future fleets is lower than for the 1993 case. Where there is an increase in LeqN, the reason was the increase in flights for the No Action Alternative, which generally was mitigated by the Preferred Alternative. These results indicate that there will be less sleep disturbance in the future than that currently experienced. Refer to Section 7.4.1 of the Supplemental DEIS/FEIR for a discussion of cumulative noise impacts.
258.2	Purpose and Need	Delays	I am a frequent business traveler. I have observed no delays in my airline schedule and see no need for further airline expansion. If Massport wants to ease delays, they should expedite baggage retrieval. Logan is by far the worst-performing airport in the country on baggage retrieval.	You appear to have been extremely fortunate, but you may not have noticed that the airlines have actually modified their flight schedules to account for delays at Logan Airport. You may have noticed that some carriers now require you to be on board ten minutes before the published departure time.

LETTER 259

Massachusetts Environmental Protection Agency
Robert A. Durand
Secretary of the Executive Office of Environmental Affairs
100 Cambridge Street, Room 2000
Boston, MA 02202
April 21, 1999

RE: Logan Airport Indigestion

Dear Mr. Durand:

Massport utilized outdated studies and numbers in its current study. Further, FAA modeling guidelines were not adhered to by Massport. In addition, there was a lack of alternative studies in the report. Some of these involved the better use of regional airports such as Hanscom, study for a other alternate airports (see my comments below), and the greater use of regional rail transportation planning. 259.1 259.2

I have attended a public hearing held at the state's Transportation Building on April 6th, Wednesday evening, to discuss the addition of Runway 14/32 to Logan airport's already crowded runway system. The furtherance of "high technology" in eastern Massachusetts was consistently quoted as a desired objective of the proposed runway addition. Speaking as a currently registered professional engineer, I'm firmly in the camp of "high technology." I am also one of the individuals representing the seemingly parochial interests of Hingham—my town—and indirectly—the towns of Hull, Cohasset & Scituate. In regard to Runway 14/32—if it's turned on, it will produce a tremendous explosion of noise pollution over my town and surrounding towns. This increase will exacerbate the 60-second interval flights that already occur over our heads. 259.3

During the public hearing, "proponents" and "opponents" alternately spoke through a microphone to the assembled audience and media. It impressed me how seemingly automated were the lady and gentlemen "suits" who continually droned mantras about the "great benefits of the new 14/32 runway." Their two most constantly used expressions were "Greater Boston Area" and "high technology." What do these two expressions equate to most of citizens of eastern Massachusetts? Generally recognized by all—these expressions can be equated with areas radiating from within and without Route 495, the western reach of the Mass turnpike beyond Worcester, and Route 128. Surely there is a jest here! The sponsors of expansion for a irremediably boxed-in Logan airport area—a tiny kernel within a very large nut—cannot sincerely be considered to speak for outlying areas at distances by auto up to 1½ or more hours away! Yet Massport has, and will continue, to speak to this entire region unless they are checked.

Currently, tremendous political and economic power, an inertia if you will, is locked into a small-sized area called Logan airport by its Massport sponsors. I suggest that a regional authority much less parochial than Massport mandate the latter to divest itself of its centrist position, and instead begin to represent the greater region called "Massachusetts." After all, the "Mass..." in Massport means Massachusetts, doesn't it? Likewise, since we're considering "air"-planes, the "...Port" in Massport must refer to an "air"-port, which can be located anywhere on land, not just by the sea. 259.4

Why not go further and have a four-state authority representing Rhode Island, New Hampshire, Maine and Massachusetts? Massport could be eliminated altogether, at least in regard to "air" concerns. We really live in a relatively small region, most of the area of which could easily be tucked, with room to spare, into any of our western states. This regional authority could unbiasedly consider the former Hanscom air force base as a candidate for national and international flights. The same authority could explore existing airports–Greene in RI, Manchester in NH, and the Portland airport in ME–for a significant upgrade to national and international status.

259.1	Analysis Assumptions/ Methodologies	Passenger Forecasts	Massport utilized outdated studies and numbers in its current study. Further, FAA modeling guidelines were not adhered to by Massport.	The projections of future airfield delays at Logan Airport are not based on analysis and modeling of delays which occurred during 1993. The analysis for 1993 was included in the Airside Project Draft EIS/EIR to provide historical perspective to the delay problem at Logan Airport and for use in model calibration. The analysis contained in the Supplemental DEIS/FEIR has been updated to include modeled delay results for 1998 to provide more current context to airfield conditions at Logan Airport. Refer to Section 4.2 of the Supplemental DEIS/FEIR for a description of the delay analysis and discussion of current and future delays at Logan Airport. The projections of future airfield delays at Logan Airport are not based on analysis and modeling of delays which occurred during 1993. The analysis for 1993 was included in the Airside Project Draft EIS/EIR to provide historical perspective to the delay problem at Logan Airport and for use in model calibration. The analysis contained in the Supplemental DEIS/FEIR has been updated to include modeled delay results for 1998 to provide more current context to airfield conditions at Logan Airport. Refer to Section 4.2 of the Supplemental DEIS/FEIR for a description of the delay analysis and discussion of current and future delays at Logan Airport. Refer to Section 4.4 of the Supplemental DEIS/FEIR for a discussion on the estimation and modeling of flight delays. It includes a description of FAA and U.S. DOT delay measures and their limitations, an explanation of computer models for estimating flight delays, and historical data on delays at Logan Airport and other major United States airports, by addressing constraints at Logan Airport, and produces lower delay estimates than FAA modeling. The FAA approved all the models, which have been validated in previously published studies of Logan Airport. The FAA Technical Center was responsible for the capacity and delay results in the 1992 FAA Capacity Enhancement Report for Logan Airport that concluded the need for Runway 14/32, reduced minimums and taxiway improvements. The Technical Center simulated Logan Airport airfield operations with the RDSIM model and estimated that when activity reached 504,000 annual operations, total delay would exceed 260,000 hours per year. The Airside Project Draft EIS/EIR forecasts delays to increase to 157,500 hours per year when annual operations reach 510,000 with the 29M Low Fleet scenario. The Supplemental DEIS/FEIR compares the FAA Technical Center delay estimates in 1992 with those of the Logan Airside Project estimates. The FAA has concluded that the Airside delays represent "a plausible and conservative estimate...." The FAA consistently rates Logan Airport as one of the most delay prone airports in the United States Logan Airport's estimated annual delay hours are over five times the FAA's 20,000-hour threshold for a severely delayed airport.

Code	Topic 1	Topic 2	Comment	Response
259.2	Regional Transportation	Regional Airports/Passenger Rail	...[T]here was a lack of alternative studies in the [Draft EIS/EIR]...Some of these [alternatives] involved the better use of regional airports such as Hanscom, study for other alternate airports...and greater use of regional rail transportation planning.	The alternative analysis conforms to FAA and MEPA scoping directives. The impact of the regional alternatives has been addressed through the study of a range of forecast activity levels. Refer to Chapter 2 of the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR for a comprehensive discussion of regional alternatives. Massport advocates increased use of the regional airports and high-speed rail services, in addition to construction of Runway 14/32 and the other airside improvement projects at Logan Airport, as a comprehensive plan for ensuring an efficient and balanced regional transportation system. As the analysis in Chapter 2 of this Supplemental DEIS/FEIR indicates, these off-airport alternatives are expected to reduce aircraft traffic growth pressures at Logan Airport, but they will not eliminate airside delays at Logan Airport that occur because of a third operating runway during periods of northwest winds. The Preferred Alternative, which specifically addresses this deficiency, is necessary and provides clear benefits at current aircraft traffic levels. These benefits will only increase in the future, even as developments at the regional airports and high-speed rail to New York act to reduce the rate of future growth at Logan Airport.
259.3	Alternatives	Runway 14/32	...Runway 14/32... will produce a tremendous explosion of noise pollution over my town and surrounding towns. This increase will exacerbate the 60-second interval flights that already occur over our heads.	In Hingham DNL levels from Logan Airport overflights are on the order of 55 dB or less, some 20 dB below the highest exposure levels experienced by communities much closer to Logan Airport.
259.4	Regional Transportation	Regional Airports	I suggest that a regional authority much less parochial than Massport ...[represent] Rhode Island, New Hampshire, Maine and Massachusetts...This regional authority could unbiasly consider the former Hanscom air force base as a candidate for national and international flights. Secretary of Environmental Affairs,
Attention MEPA Office,
Mr. Arthur Pugsley - EOEA No. 10,
100 Cambridge Street 20th Floor
Boston MA 02205

Dear Sir,

We wish to record our opposition to the proposed new Runway 14/32 at Logan Airport. It is our view that the new runway will increase noise and air pollution significantly and lower the quality of life for the people of Hingham and many other areas. 261.1

It is our conclusion, having last week made use of T.F. Green Airport at Providence for the first time, that the solution to increased air traffic requirements for the Boston area is to develop and make greater use of other airports in the region. T.F.Green Airport is, for example, totally under utilised. 261.2

Yours sincerely,

Harold and Lorraine Lincoln

Re: Opposed to Runway 14/32

Secretary of Environmental Affairs
Attention: MEPA Office
Arthur Pugsley-EOEA No.10
100 Cambridge St. 20th floor
Boston, MA 02205

Dear Mr. Secretary,

The work of the Logan Growth and Impact Study, begun in 1987 and the Second Airport Study are the future of air traffic in the Boston area. The current proposal to expand Logan Airport asks the EOEA to abandon past environmental agreements because regional solutions are difficult. 262.1

Massport regularly is quoted as saying that much of the traffic added under the 14/32 proposal will be "over water". This is misleading. These flights are over water for a short time and then over Hingham, Hull and Cohasset. 262.2

Please uphold the commitment to maintain Logan environmental impacts at or below 1987 levels.

Very truly yours,

Adrienne F. Richardson

Adrienne F. Richardson

262.1	Environmental Review Process	MEPA	The work of the Logan Growth and Impact Study, begun in 1987 and the Second Airport Study are the future of air traffic in the Boston area. The current proposal to expand Logan Airport asks the EOEA to abandon past environmental agreements because regional solutions are difficult...Please uphold the commitment to maintain Logan environmental impacts at or below 1987 levels.	Massport disagrees. The *Logan Airport 1999 ESPR* contains a detailed discussion of Massport's success in meeting its project-related mitigation commitments.
262.2	Alternatives	Runway 14/32	Massport regularly is quoted as saying that much of the traffic added under the 14/32 proposal will be "over water". This is misleading. These flights are over water for a short time and then over Hingham, Hull and Cohasset.	The operations of Proposed Runway 14/32 would be over the water. The departures on Runway 14 would turn over the inner harbor and proceed out the harbor mouth, as do the departures on Runway 15R, the nighttime preferential runway. Similarly, the last several miles of the approach path to Runway 32 would be over water and largely uninhabited islands. When Runway 14/32 is in operation, it would reduce the noise exposure over populated communities.

LETTER 263

April 19, 1999

Re: Opposed to Runway 14/32

Secretary of Environmental Affairs
Attention: MEPA Office
Arthur Pugsley-EOEA No.10
100 Cambridge St. 20th floor
Boston, MA 02205

Dear Mr. Secretary,

I am writing in opposition to the Runway 14/32 expansion proposed at Logan Airport. The fact that the Boston area would continue to grow was given full consideration when airport expansion was banned. This necessary environmental action put Massport on notice that future expansion would have to be part of a regional plan. None of the problems being touted by Massport today, including flight delays, are new. They should serve to illustrate Massport's failure to deal effectively with regional solutions. All such problems were considered, none were found to be more compelling than the environmental need to ban expansion. 263.1

Environmental protection, by its very nature, must avoid the shortsighted thinking that brings this type of temporary relief to your office. Please oppose 14/32 or any Logan expansion.

Very truly yours,

John E. Richardson

LETTER 264

Re: Proposed runway expansion Logan

Dear Sir:

I do not work for Massport, the government or the airlines. I have never been connected in any way with them. However, I have lived for twenty-seven years on World's End in Hingham, directly under the approach into Runway 33 at Logan. I recently received a flyer asking me to protest the runway expansion because of the projected noise and air pollution.

I do not see the problem. While I can sit outside and watch the airplanes on their approach path, they are so powered back that one must focus to hear them. As I understand it, the proposed runway is for even smaller aircraft than the big jets currently going overhead. Doubling or tripling the aircraft would not increase the intensity of the noise, only the frequency. When the noise only rarely intrudes into my awareness, I do not see it as a problem. Departures seem to be vectored over the open water so that their noise even more rarely makes it into my awareness. 264.1

The easiest solution has probably already been done, namely, determination of actual sound levels by monitors on the ground. I suspect the dB level is quite low. 264.2

Sincerely,

Elliott Schiffman

LETTER 265

Stephen K. Thress
8 Weir Street Ext.
Hingham, MA 02043

April 20, 1999

Secretary of Environmental Affairs
Attention: MEPA Office
Mr. Arthur Pugsley- EOEA No. 10
100 Cambridge Street
20th Floor
Boston, MA 02205

Dear Sir:

I am writing to express my opposition to Massport's proposal to build runway 1432 which we were told is being built in order to ease airline congestion and reduce delays.

This proposal, at best, is a short term fix and does not in any way address the more important long term issue of creating efficient air travel for the New England area. If this is in fact only a short term solution why have I have not seen any alternative proposals? As a first step, I am perplexed why Massport has not significantly increased landing fees to push non-commercial traffic to alternative sites to make room for more passenger carriers. What about other regional solutions? 265.1 265.2

The noise and pollution we already endure is at a critical stage and the increase in air traffic as a result of this runway will significantly reduce the quality of life and safety for the thousands of residents who reside near Logan. 265.3 265.4

What we need is a long term plan that provides the citizens of this Commonwealth a first class airline transportation system. This "band-aid" approach will not cut it!

Sincerely yours,

S. K. Thress

265.1	Alternatives	Runway 14/32	...[Runway 14/32] is a short term fix and does not in any way address the more important long term issue of creating efficient air travel for the New England area.	Based on simulation modeling, Logan Airport experienced 120,000 hours of runway-related delays in 1998. If no actions are taken, runway-related delays are forecast to grow as high as 333,000 hours under a 37.5M High Fleet scenario. The Preferred Alternative produces immediate and long-term benefits by lowering runway delays by 38,000 hours if it had been in place in 1998, and by as much as 94,000 hours in the future 37.5M High Fleet scenario. Because of the impact of the regional alternatives, the 37.5M High Fleet scenario is not expected to be achieved until 2015. The sooner airside efficiencies are implemented; the more benefits will accrue over time. Section 4.6 of the Supplemental DEIS/FEIR shows that delay reduction benefits increase over time as traffic levels increase. The alternative analysis conforms to FAA and MEPA scoping directives. The impact of the regional alternatives has been addressed through the study of a range of forecast activity levels. Refer to Chapter 2 of the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR for a comprehensive discussion of regional alternatives. Massport advocates increased use of the regional airports and high-speed rail services, in addition to construction of Runway 14/32 and the other airside improvement projects at Logan Airport, as a comprehensive plan for ensuring an efficient and balanced regional transportation system. As the analysis in Chapter 2 of this Supplemental DEIS/FEIR indicates, these off-airport alternatives are expected to reduce aircraft traffic growth pressures at Logan Airport, but they will not eliminate airside delays at Logan Airport that occur because of a third operating runway during periods of northwest winds. The Preferred Alternative, which specifically addresses this deficiency, is necessary and provides clear benefits at current aircraft traffic levels. These benefits will only increase in the future, even as developments at the regional airports and high-speed rail to New York act to reduce the rate of future growth at Logan Airport.
265.2	Alternatives	Other Non-Construction Alternatives	...why [has] Massport...not significantly increased landing fees to push non-commercial traffic to alternative sites to make room for more passenger carriers.	Section 4.5 of the Supplemental DEIS/FEIR provides an updated discussion of PPP at Logan Airport and an analysis of the implications of an illustrative conceptual small community exemption program. PPP was included among the Airside Project alternatives to address delays caused by over-scheduling. The potential impact of PPP on the fleet mix at Logan Airport is discussed in Section 4.5.2 of the Supplemental DEIS/FEIR. Section 4.5.3 of the Supplemental DEIS/FEIR provides an analysis of a PPP Exemption program
265.3	Regional Transportation	Regional Airports	What about other regional solutions?	Refer to response to Comment 265.1.

Code	Topic 1	Topic 2	Comment	Response
265.4	Noise, Air Quality	Impacts	...the increase in air traffic as a result of this runway will significantly reduce the quality of life and safety for the thousands of residents who reside near Logan.	Implementation of the recommended Airside Project, specifically unidirectional Runway 14/32, would not increase Logan Airport's normal airfield capacity of approximately 120 operations per hour. This capacity is available at Logan Airport approximately 80 percent of the time. Runway 14/32 would allow Logan Airport to maintain this capacity during periods of strong northwest winds that now require controllers to operate on only one or two runways, compared to the typical three-runway configurations used at Logan Airport.

LETTER 266

OPPOSED TO RUNWAY 14/32

April 17, 1999

Secretary of Environmental Affairs
Attention MEPA Office
Mr. Arthur Pugsley EOEA No. 10
100 Cambridge St 20th floor
Boston, Ma. 02205

Dear Mr. Pugsley:

The plan to develop Runway 14/32 is unacceptable to us in Hingham.

My neighbors and I have made repeated calls complaining about incoming flights under the glide path and the high volume of flights over us when runway 33 is in use. 266.1

To add 26,000 more incoming flight which would be over Hingham would be unacceptable.

We are opposed to the Runway 14/32 plan and believe the time has come to start using regional airports. 266.2

Sincerely,

Bradford S. Tripp
Jane L Tripp
9 Ringbolt Rd.
Hingham, Ma. 02043

Code	Topic 1	Topic 2	Comment	Response
266.1	Alternatives	Runway 14/32	...[Concerned about] incoming flights under the glide path and the high volume of flights over us when Runway 33 is in use; adding...26,000 more incoming flights [with Runway 14/32] which would be over Hingham would be unacceptable.	Hingham is not directly under the approach path for Runway 33. There is no evidence to suggest that the levels of environmental noise generated by Logan Airport are a health risk to residents. This is especially true in Hingham where DNL levels from Logan Airport overflights are on the order of 55 dB or less, some 20 dB below the highest exposure levels experienced by communities much closer to Logan Airport.
266.2	Regional Transportation	Regional Airports	...the time has come to start using regional airports.	The alternative analysis conforms to FAA and MEPA scoping directives. The impact of the regional alternatives has been addressed through the study of a range of forecast activity levels. Refer to Chapter 2 of the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR for a comprehensive discussion of regional alternatives. Massport advocates increased use of the regional airports and high-speed rail services, in addition to construction of Runway 14/32 and the other airside improvement projects at Logan Airport, as a comprehensive plan for ensuring an efficient and balanced regional transportation system. As the analysis in Chapter 2 of this Supplemental DEIS/FEIR indicates, these off-airport alternatives are expected to reduce aircraft traffic growth pressures at Logan Airport, but they will not eliminate airside delays at Logan Airport that occur because of a third operating runway during periods of northwest winds. The Preferred Alternative, which specifically addresses this deficiency, is necessary and provides clear benefits at current aircraft traffic levels. These benefits will only increase in the future, even as developments at the regional airports and high-speed rail to New York act to reduce the rate of future growth at Logan Airport.

LETTER 267

Mr. Robert A. Durand, Secretary
Executive Office of Environmental Affairs
100 Cambridge Street - Rm 2000
Boston, MA 02202

March-April 1999

Dear Mr. Durand,

I urge you to oppose Runway 14/32, which has very little to do with delay reduction and everything to do with expansion of capacity at Logan. According to Massport's MEPA EIS report, the runway would reduce delays only 20% of the time and would be effective only until the year 2003, when delays at Logan will be *at or above* today's levels. This short-sighted, ineffective proposal cannot justify the permanent environmental damage it will cause residents throughout Greater Boston. Please work with local residents to ensure that the present court injunction against 14/32, placed there to protect us from dangerous environmental impacts, remains in place. 267.1

Residents of Boston and surrounding areas *who already bear an unfair portion* of the noise, air pollution and auto traffic caused by Logan will be permanently impacted with triple the amount of planes passing over our homes, if 14/32 is built. We need airport RELIEF, not additional negative impacts! Massport's present noise contour lines (used to determine sound proofing qualification) have not been updated to reflect the actual noise levels suffered by abutting communities. Noisy night flights at Logan have increased dramatically, violating Massport's previous agreement to voluntarily limit night flights. 267.2 267.3 267.4

Massport should direct significantly more flights to Hanscom Airport located just 25 minutes from Boston and presently utilized at *only a third of its capacity*. Hanscom presently has the runway capacity to handle commercial commuter planes. Massport could redesignate Hanscom as a commercial commuter airport instead of an elitist "small corporate jet" airport, as it is now designated. By increasing air traffic at Hanscom, Worcester, Manchester and Providence to the maximum capacity possible, Massport can avoid future delays at Logan AND allow Boston residents to maintain some semblance of a healthy quality of life. Another alternative which Massport must implement is Peak Hour Pricing, a demand management tool which is very successfully used in the hotel and tourism industry as well as the electric utility industry. For profit reasons, airlines prefer to increase capacity rather than manage demand, and will not voluntarily adopt Peak Hour Pricing unless forced to by public officials. 267.5 267.6 267.7

Massport misleads the public when it claims that Logan has "notorious delays." Since 1992, delays at Logan have gone down, according to data in the Federal Aviation Administration's 1998 ACE (Airport Enhancement Capacity) Report. The only reason that Massport claims that Logan has a "delay problem," is because Massport uses exceedingly high "maximum capacity" goals. Located in such a densely populated urban area, Massport's maximum capacity goals should be 90 rather than 120 planes per hour. Massport's EIS represents the interests of airlines and airport-related businesses, all of whom stand to make big profits if Logan's overall capacity is increased by runway 14/32. None of these groups care about the impact 14/32 will have on human beings, because few if any of them live in the impacted communities. 267.8 267.9

The EIS does not take into account health impacts (Boston's inner city neighborhoods already have the highest asthma, emphysema and respiratory infection levels in the State - conditions aggravated by plane and car fumes). Recent studies done by DPH also associate increased risk of brain tumors in communities abutting airport runways. The EIS does not take into consideration the environmental and quality of life issues of Boston's inner city residents, nor does it mention the devaluation of real estate prices for the thousands of homes under the flight paths. It also does not take into consideration the lost municipal tax revenues when families living in inner city neighborhoods are forced to leave the area because they can no longer stand the persistent and excessive plane noise and fumes. Please reject Massport's EIS, support the present court injunction against 14/32, and encourage Massport to seek alternative, responsible methods to handle projected air travel increases. 267.10 267.11 267.12

Sincerely,

Catherine Goldhammer

267.1	Purpose and Need	Airfield Capacity	I urge you to oppose Runway 14/32, which has very little to do with delay reduction and everything to do with expansion of capacity at Logan. According to Massport's MEPA EIS report, the runway would reduce delays only 20% of the time and would be effective only until the year 2003, when delays at Logan will be *at or above* today's levels.	Based on simulation modeling, Logan Airport experienced 120,000 hours of runway-related delays in 1998. If no actions are taken, runway-related delays are forecast to grow as high as 333,000 hours under a 37.5M High Fleet scenario. The Preferred Alternative produces immediate and long-term benefits by lowering runway delays by 38,000 hours if it had been in place in 1998, and by as much as 94,000 hours in the future 37.5M High Fleet scenario. Because of the impact of the regional alternatives, the 37.5M High Fleet scenario is not expected to be achieved until 2015. The sooner airside efficiencies are implemented; the more benefits will accrue over time. Section 4.6 of the Supplemental DEIS/FEIR shows that delay reduction benefits increase over time as traffic levels increase.
267.2	Alternatives	Runway 14/32	Residents of Boston and surrounding areas *who already bear an unfair portion* of the noise, air pollution and auto traffic caused by Logan will be permanently impacted with triple the amount of planes passing over our homes if 14/32 is built.	The Supplemental DEIS/FEIR projects that the Preferred Alternative would promote runway use in a manner that is more consistent with annual PRAS goals. The total number of departures from Runway 27 (over South Boston, Roxbury, and Jamaica Plain) would increase, but the number of equivalent jet operations would remain essentially the same. The difference in these communities would be fewer nighttime operations and more daytime operations but the same noise impacts. Total departures from Runway 33L and arrivals to Runway 15R (over East Boston and Chelsea) would increase, but most of these are non-jets. These runway operations are currently running well below the PRAS goals, and the unidirectional Runway 14/32 would allow the controllers to approach, but still remain below the annual goals for these operations. Additionally, by increasing the number of operations over water, Runway 14/32 would reduce the total annual hours of dwell and persistence over populated areas in accordance with short-term PRAS goals.

Code	Topic 1	Topic 2	Comment	Response
267.3	Noise	Sound Insulation	Massport's present noise contour lines (used to determine soundproofing qualification) have not been updated to reflect the actual noise levels suffered by abutting communities.	Differences between measured and modeled sound levels have been reported in Logan Airport's various GEIRs and Annual Updates for a number of years. Differences at close-in locations were significantly reduced in 1996 through modification of source levels to better account for over-water sound propagation and apparent use of higher engine power settings than are normally assumed in the noise model's database (Refer to Appendix F of the *Logan Airport 1996 Annual Update).* In 1998, differences between measured and modeled noise became even less when Massport upgraded its monitoring system and began to report noise caused only by aircraft -- a metric directly comparable to the DNL exposure levels predicted by the noise model. At sites having exposure levels of 60 dB or more, this improvement to the monitoring system brought measured and modeled DNL values to within 0.2 dB of each other. (Refer to Chapter 6 of the *Logan Airport 1999 ESPR* (previously GEIR)). Massport continues to investigate possible causes for remaining differences (such as from hill effects) and continues to pursue FAA approval of noise model adjustments that would permit expansion of its sound insulation program to include the effects of terrain. Massport also expects to extend eligibility lines to include boundaries that follow local streets rather than strict noise contour lines. Nevertheless, Massport continues to believe that the FAA's INM noise model used in the Airside Project noise analyses accurately represents expected noise exposure.
267.4	Noise	Nighttime Noise	Noisy night flights at Logan have increased dramatically, violating Massport's previous agreement to voluntarily limit night flights.	Table 6.2-17 of the Supplemental DEIS/FEIR shows nighttime jet operations projected to increase from 144 in 1998, to as many as 231 under the No Action Alternative with the 2015 High Regional Jet Fleet. However, regardless of the fleet, many of the future night operations are the result of delays that will occur as demand at Logan Airport continues to increase. One of the direct benefits of the Preferred Alternative is that it will reduce these night operations by 32 to 43 flights depending on the fleet forecast, though *any* alternative to the No-Action scenario will help alleviate some of the projected delays. In addition, Massport is committed to exploring other measures to reduce nighttime noise whether or not the Preferred Alternative is implemented.

Code	Topic 1	Topic 2	Comment	Response
267.5	Regional Transportation	Regional Airports	Massport should direct significantly more flights to Hanscom Airport ... presently utilized at *only a third of its capacity.* Hanscom ... has the runway capacity to handle commercial commuter planes. Massport could redesignate Hanscom as a commercial commuter airport ...	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR, specifically considered the role of Hanscom Field in the analysis of regional alternatives. Hanscom Field, which serves as a general aviation reliever airport to Logan Airport, already accommodates a significant number of aircraft operations (183,000 operations in 1998). The Hanscom Field activity includes private, business, charter, and air taxi operations that might otherwise use Logan Airport. Since the Airside Project Draft EIS/EIR was filed, Shuttle America, a newly founded airline, began commercial scheduled operations at Hanscom Field, offering limited turboprop services to short-haul regional markets – Trenton, Buffalo, Hartford (discontinued), Wilmington, Delaware (discontinued), and Greensboro. Shuttle America is also conducting operations between Hanscom and New York LaGuardia Airport. While Massport supports commercial service at Hanscom Field consistent with its established limits (60 seat regulation), Massport believes that Hanscom Field will maintain its role as a major general aviation reliever, and that its geographic proximity to Logan, Worcester Regional and Manchester airports will prevent its development as a significant commercial airport. Additionally, commuter airlines serving Logan Airport are unlikely to move a significant number of flights from Logan Airport to Hanscom Field, since approximately 50 percent of passengers on Logan Airport's commuter flights connect to other Logan Airport flights and a significant number of passengers are travelling to Boston. However, any new commercial service initiatives proposed for Hanscom Field shall be reviewed for consistency with the *Hanscom GEIR* (HGEIR) and its Annual Updates, and shall be considered by the Hanscom Area Town Selectmen (HATS). Refer to Section 2.6 of the Supplemental DEIS/FEIR for a discussion of Hanscom Field.
267.6	Regional Transportation	Regional Airports	By increasing air traffic at Hanscom, Worcester, Manchester and Providence to the maximum capacity possible, Massport can avoid future delays at Logan AND allow Boston residents to maintain some semblance of a healthy quality of life.	Chapter 2 of the Supplemental DEIS/FEIR provides a discussion of the specific role played by the regional transportation alternatives and steps that Massport has taken to foster use of these alternatives. Massport has long recognized and has been a proponent of options to Logan Airport. Together with the regional airports, Massport has implemented a regional strategy to enhance the use of options to Logan Airport. In the Draft EIS/EIR, Massport identified up to 7.3 million annual passengers that could be absorbed by regional alternatives that include use of T.F. Green/Providence, Manchester and Worcester Regional airports, as well as the new high-speed rail to New York. In the Supplemental DEIS/FEIR, Massport recognizes that these developments will slow Logan Airport's passenger traffic growth. Logan Airport may not achieve the 37.5 million passenger forecasts until after 2010, but rather closer to 2015, and the 45 million passenger forecasts may not be achieved until after 2020. While regional alternatives can play an important role in reducing the rate of future traffic growth at Logan Airport, they do not address Logan Airport's inability to efficiently accommodate current levels of demand during northwest wind conditions. Runway 14/32, which is designed to correct the problem with Logan Airport's layout, is necessary to correct this deficiency and provides clear benefits at current aircraft traffic levels. These benefits will only increase in the future, even as developments at the regional airports act to reduce the rate of future growth at Logan Airport.

Code	Topic 1	Topic 2	Comment	Response
267.7	Alternatives	Peak Period Pricing	Another alternative which Massport must implement is Peak Hour Pricing ...	Section 4.5 of the Supplemental DEIS/FEIR provides an updated discussion of PPP at Logan Airport and an analysis of the implications of an illustrative conceptual small community exemption program. PPP was included among the Airside Project alternatives to address delays caused by over-scheduling. The potential impact of PPP on the fleet mix at Logan Airport is discussed in Section 4.5.2 of the Supplemental DEIS/FEIR. Section 4.5.3 of the Supplemental DEIS/FEIR provides an analysis of a PPP Exemption program
267.8	Purpose and Need	Delay	Massport misleads the public when it claims that Logan has "notorious delays." Since 1992, delays at Logan have gone down, according to data in the Federal Aviation Administration" 1998 ACE (Airport Enhancement Capacity) Report.	Section 1.4 and Appendix C of the Supplemental DEIS/FEIR contains a discussion of the FAA and U.S. DOT delay measures and historical data, along with comparisons of Logan Airport with other United States airports. The delay situation is not at equilibrium. FAA Opsnet delays at Logan Airport peaked in 1993, declined for two years and are rising again. Arrival delays, which would be directly affected by Runway 14/32, have risen steadily since 1994. In fact, Logan Airport is the second most delayed airport in the nation for arrivals.
267.9	Delay Model	Model	The only reason that Massport claims that Logan has a "delay problem," is because Massport uses exceedingly high "maximum capacity" goals. Located in such a densely populated urban area, Massport's maximum capacity goals should be 90 rather than 120 planes per hour.	Airfield capacity is a function of the runways in service, the fleet mix using them, prevailing weather conditions, and FAA air traffic control procedures. Massport cannot arbitrarily define the runway capacity or airline schedules. The highest capacity configuration at Logan Airport today for three runways in good weather is about 120 operations per hour.
267.10	Public Health	Effects	The EIS does not take into account health impacts (Boston's inner city neighborhoods already have the highest asthma, emphysema and respiratory infection levels in the state--conditions aggravated by plane and car fumes). Recent studies done by DPH also associate increased risk of brain tumors in communities abutting airport runways.	Massport has provided the City of Boston and public health agencies with air quality and emissions data. In January 1996, Massport reviewed available public health data, including mortality and morbidity from each neighborhood in Boston and cancer incidence data available from the Massachusetts Department of Public Health. These data indicated that causal relationships cannot be determined at this time. A review of the 1999 *Report to the Mayor, Health of Boston* prepared by the Boston Public Health Commission leads to a similar conclusion. In addition, Massport has shared the results of the *Soot Deposition Study* with public health agencies and is cooperating with the Harvard School of Public Health on the *South Boston Particle Source Apportionment Study.* The 1999 Massachusetts budget included $150,000 to fund an environmental assessment of the health impacts of Logan Airport on any community located within a five-mile radius of the airport. The final protocol for the study is being developed. The study is expected to be completed in summer 2002. Information on public health issues is provided in Chapter 6 of the Supplemental DEIS/FEIR.

Code	Topic 1	Topic 2	Comment	Response
267.11	Cumulative Impacts	Socio-economic	The EIS does not take into consideration the environmental and quality of life issues of Boston's inner city residents, nor does it mention the devaluation of real estate prices for the thousands of homes under the flight paths.	Refer to Section 6.8 of the Supplemental DEIS/FEIR for a discussion of the Environmental Justice analysis. Noise was found to be the only adverse impact from the Preferred Alternative with the potential for Environmental Justice impacts. Additional demographic analysis of the noise-affected areas was conducted to determine if minority and/or low-income populations would be disproportionately affected by the Preferred Alternative. This analysis found that there is no high and adverse disproportionate impact caused by the Preferred Alternative. Noise was identified as the only off-airport impact from the Preferred Alternative with the potential for environmental justice impacts. The environmental justice analysis found no disproportionately high and adverse impacts to low-income and minority populations from direct project impacts. However, because the area added to the 65 dB DNL contour is primarily within the City of Chelsea, other environmental and health issues were also considered in an effort to assess other cumulative or multiple adverse exposures.
267.12	Cumulative Impacts	Socio-economic	[The EIS] also does not take into consideration the lost municipal tax revenues when families living in inner city neighborhoods are forced to leave the area because they can no longer stand the persistent and excessive plane noise and fumes.]	Comment noted.

LETTER 268

LETTER 269

Dear Mr. Pugsley,

We are opposed to the runway expansion at Logan Airport. There are too many flights now without adding more. The noise will be unbearable. 269.1

It's time to find an alternative site for additional flights. This would ease the disturbance now caused to the surrounding communities in the flight paths. Let's explore reducing the number of flights rather than adding to the noise and air pollution. 269.2

Sincerely,

Nancy Grayton

269.1	Alternatives	Runway 14/32	...opposed to the runway expansion at Logan Airport. There are too many flights now without adding more. The noise will be unbearable.	The Preferred Alternative, and specifically unidirectional Runway 14/32, would not increase Logan Airport's normal airfield capacity of approximately 120 operations per hour. This capacity is available at Logan Airport approximately 80 percent of the time. Runway 14/32 would allow Logan Airport to maintain this capacity during periods of strong northwest winds that now require controllers to operate on only one or two runways, compared to the typical three-runway configurations used at Logan Airport. The runway will not increase Logan Airport's normal operating capacity, nor will it encourage or induce an increase in aircraft operations. The Supplemental DEIS/FEIR projects that the Preferred Alternative would promote runway use in a manner that is more consistent with annual PRAS goals, and Hull is affected by the use of Runway 33/32 arrivals. The total number of aircraft arriving to the northwest does increase with construction of the runway, but this is due to the PRAS goals more than any other factor. Since the Runway 33 arrivals that impact Hull approach primarily over water, and since Hull is further from the airport than those communities impacted by arrivals to Runway 15L/R, 4L/R, or 22L/R, the PRAS goals call for 42 percent of the equivalent arrivals to operate in this direction. Runway 33 arrivals accounted for approximately 27 percent of the equivalent arrivals in 1998, and since Logan Airport has a limited capacity in this direction, the northwest configuration has been underutilized as demand has increased over the years. Construction of the runway allows better achievement of the agreed-upon PRAS goals, but even with Runway 14/32, the equivalent arrivals in the Runway 33/32 direction never reach the goal of 42 percent under any fleet scenario or alternative. Operations in the vicinity of Hull increase with the Preferred Alternative primarily due to aircraft landing to the northwest, either on new Runway 32 or because of greater use of Runway 33L. However, the noise exposure levels resulting from these increased operations remains several decibels below 60 DNL as indicated by the specific point analysis at Site 26 in Tables 6.2-8, 6.2-11, 6.2-22, and E-1 of the Supplemental DEIS/FEIR. These levels are nearly 20 dB below the highest exposure in Winthrop and 15 dB below the exposure in parts of East Boston and Revere, which the new runway would help to improve.

Code	Topic 1	Topic 2	Comment	Response
269.2	Regional Transportation	Regional Airports	It's time to find an alternative site for additional flights.	Because the development of a second major airport would require ten to 15 years for site selection and environmental review, in addition to a multi-year construction period, this option is not viewed as a solution to accommodating forecast demand over the next 20 years. Hanscom Field's potential service area overlaps with the service areas for several airports that already have the necessary infrastructure for commercial service. These airports are the Hanscom Field, T.F. Green/Providence, and Worcester Regional, all which have had or are undergoing major improvements to their terminal buildings, other landside facilities and airfields.

RE: Opposition to Proposed Logan Runway Expansion

Dear Mr. Pugsley:

I am a long-time Hull Village resident and realize that we have to bear our fair share of airplane traffic over our home, after all, we occasionally fly, too.

I feel we do already have our fair share and I urge you not to allow for any additional runway at Logan. Please!!! 270.1

Thank you for your consideration of this request.

Sincerely,

M. L. Carlson

271.1	Alternatives	Peak Period Pricing	Instead of building a new runway...have smaller planes pay higher fees during peak hours to help ease airplane traffic....	Section 4.5 of the Supplemental DEIS/FEIR provides an updated discussion of PPP at Logan Airport and an analysis of the implications of an illustrative conceptual small community exemption program. PPP was included among the Airside Project alternatives to address delays caused by over-scheduling. The potential impact of PPP on the fleet mix at Logan Airport is discussed in Section 4.5.2 of the Supplemental DEIS/FEIR. Section 4.5.3 of the Supplemental DEIS/FEIR provides an analysis of a PPP Exemption program.
271.2	Ground Transportation	Access to Regional Airports	...have shuttle buses that are centrally located to take people to Green RI and Manchester NH airports.	Logan Airport is part of a regional system of airports that includes T.F. Green/Providence, Worcester Regional and Manchester. Massport has long recognized that service development and increased passenger traffic at these airports are an important part of the region's long-term strategy to accommodate passenger and activity growth. Massport has actively encouraged the development of regional airports and full use of other options, including high-speed rail to Logan Airport's largest market, New York. Regional service was examined in Chapter 2 of the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR. This analysis supports the conclusion greater use of the regional airports will provide passengers within the service area of such airports with a viable alternative to Logan Airport. Since demand within Logan Airport's primary service area will remain strong, the improvements at other regional airports will not eliminate the need for airside projects at Logan Airport.

Boston, MA 02205

Mr. Pugeley:

We are 20 year, home-owning residents of the town of Hull writing to express our strong opposition to the proposed new runway at Logan. The evidence of excellent, viable alternatives, compounded by the evidence of quantifiable duress, is incontrovertible. Please weight the well-being of the many as heavily as the pocket-books of the few, and without cynicism oppose this action. 272.1

Sincerely,

Lory Newmyer and Steve Cooper

272.1	Alternatives	Other Non-Construction Alternatives	We...express our strong opposition to the proposed new runway at Logan. The evidence of excellent, viable alternatives, compounded by the evidence of quantifiable duress, is incontrovertible.	The alternative analysis conforms to FAA and MEPA scoping directives. The impact of the regional alternatives has been addressed through the study of a range of forecast activity levels. Refer to Chapter 2 of the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR for a comprehensive discussion of options to Logan Airport. Massport advocates increased use of the regional airports and high-speed rail services, in addition to construction of Runway 14/32 and the other airside improvement projects at Logan Airport, as a comprehensive plan for ensuring an efficient and balanced regional transportation system. As the analysis in Chapter 2 of this Supplemental DEIS/FEIR indicates, these off-airport alternatives are expected to reduce aircraft traffic growth pressures at Logan Airport, but they will not eliminate airside delays at Logan Airport that occur because of a third operating runway during periods of northwest winds. The Preferred Alternative, which specifically addresses this deficiency, is necessary and provides clear benefits at current aircraft traffic levels. These benefits will only increase in the future, even as developments at the regional airports and high-speed rail to New York act to reduce the rate of future growth at Logan Airport.

LETTER 273

April 14, 1999

Arthur Pugsley
MEPA Office
100 Cambridge Street – 20th floor
Boston, MA 02205

Dear Mr. Pugsley:

I'm writing to give my opposition to the proposed additional runway at Logan. I moved to Hull in 1991 and I was very surprised about the great number of airplanes flying over my home. I was even more surprised when the number has increased ever since then. Friends of mine who have been in planes that took off from Logan have later told me how close they flew over my house and that they looked for me on the front porch. I often still stop in the parking lot to look up at the planes and to very easily read their numbers. My porch faces Boston Light and is a wonderful location, except when planes fly over and all conversation has to stop because of the sound. The addition of another runway, which Mr. Blute has described as having planes "fly over the harbor", is not a reasonable expectation. He must have spent too much time in Central Mass because he doesn't know there are people and towns existing across the harbor.

The elected officials, community activists and citizens of Hull have united with Boston neighborhoods and other communities in strong opposition to the new runway/taxiway proposal being made by Massport. We are extremely upset that the Governor has changed his original position and is now officially endorsing the proposal. Our community leaders and citizens have been actively meeting with our state and federal government legislators to discuss our concerns regarding this specific proposal, as well as the core problem of dealing with the projections for significant increases in air traffic demand for the region.

273.1

I work in Boston everyday and am concerned about the entire Boston area as much as with Hull. Regardless of a new runway, and according to Massport's own projections, demand for passengers and aircraft to come to the area is expected to grow significantly, and flight delays are expected to soar. As a physically small inner-city airport, Logan has exceeded reasonable capacity and cannot handle the dramatic projected demand without putting Boston, the Harbor and surrounding communities in extreme danger.

Please know that we support economic growth for Boston, the Commonwealth and New England. There are answers to the problem which could bring economic benefit outside of Boston, but trying to increase capacity at Logan is not the answer. Such a course would be severely detrimental to those of us who call the Boston area home and, ironically, to those visitors expected to fly here as well. Our health and safety are already at great risk. Our burden has increased each year. We cannot accept more!

There are serious questions regarding the adequacy, quality and reliability of information supplied by Massport. We ask you to understand that the health and quality of life of Boston area residents is threatened. We hope you agree that full input from all involved communities is essential before your office reaches any decisions that will impact so many Boston area residents.

Sincerely,

Pauline DePari

273.1	Alternatives	Runway 14/32	[Concerned with]...this specific proposal, as well as the core problem of dealing with the projections for significant increases in air traffic demand for the region. Regardless of a new runway, and according to Massport's own projections, demand for passengers and aircraft to come to the area is expected to grow significantly and flight delays are expected to soar...putting Boston, the Harbor and surrounding communities in extreme danger.	Anticipated future passenger and operations levels can be accommodated by Logan Airport without any airside improvements but not without delays and resulting adverse environmental impacts. The goals of the Airside Project are to reduce delays, increase the airport's efficiency and improve airfield safety in an environmentally responsible manner. Long-term aviation growth is a recognized worldwide condition, based on economic and demographic factors, and is not under Massport's control. Massport estimates that up to 7.3 million Logan Airport air passengers may be diverted to other modes/airports or eliminated through advances in telecommunications. This estimate is based on analyses of passenger origins/destinations and mode choice decisions conducted for other studies. While these alternatives can play a role in providing relief to Logan Airport, they do not eliminate the need for airside improvements.

Opposed to Runway 14/32

Dear Mr. Pugsley

As someone who's lived and worked in the greater Boston area my entire adult life, I dearly love this area and its resources. Please do NOT allow the area to be further polluted by the building of the unnecessary RUNWAY 14/32. I hope you will join your voice to those of us trying to preserve the area from further damage by increased air traffic overhead.

274.1

Sincerely,

David Jones, Asst. Production Manager & Hull resident

274.1	Alternatives	Runway 14/32	Please do NOT allow the area to be further polluted by the building of the unnecessary Runway 14/32.	The goals of the Airside Project are to reduce delay, increase the airport's efficiency, and improve airfield safety in an environmentally responsible manner. The construction of unidirectional Runway 14/32 would prevent the significant drop in airfield capacity that now occurs during northwest wind conditions. The runway would not increase Logan Airport's normal operating capacity of approximately 120 operations per hour which is available nearly 80 percent of the year, but rather would allow this capacity to be maintained more consistently. The emissions inventory and dispersion modeling indicate better air quality conditions with Runway 14/32 and the Centerfield Taxiway than with the No Action Alternative.

LETTER 275

April 5, 1999

Secretary of Environmental Affairs
Attention: MEPA Office
Mr. Arthut Pugsley - EOEA No. 10458
100 Cambridge Street
20th Floor
Boston, MA 02205

Dear Mr. Pugsley,

We are opposed to the Runway 14/32 for the following reasons:

- Increased traffic and resulting noise 275.1
- Fear of catastrophic air collisions 275.2
- Time is now to look for another area for an airport, while the land is still available and within reach financially 275.3

Thank you for your consideration.

Sincerely,

Frank & Eileen Furey
50 Valley Beach Ave
Hull, Ma 02045

Letter 275
Frank and Eileen Furey

Code	Topic 1	Topic 2	Comment	Response
275.1	Noise	Impacts	[Oppose Runway 14/32 because of] increased traffic and resulting noise.	The Preferred Alternative, and specifically unidirectional Runway 14/32, would not increase Logan Airport's normal airfield capacity of approximately 120 operations per hour. This capacity is available at Logan Airport approximately 80 percent of the time. Runway 14/32 would allow Logan Airport to maintain this capacity during periods of strong northwest winds that now require controllers to operate on only one or two runways, compared to the typical three-runway configurations used at Logan Airport. The runway will not increase Logan Airport's normal operating capacity, nor will it encourage or induce an increase in aircraft operations.
275.2	Alternatives	Runway 14/32	[Oppose Runway 14/32 because of] fear of catastrophic air collisions.	The first goal of the FAA and Massport is always to provide safe air transportation. Logan Airport has a tightly controlled system of flight tracks and procedures to prevent aircraft accidents. Runway 14/32 and the other proposed Airside improvements are designed to enhance safety and efficiency of traffic operations in the air and on the ground. The runway will segregate smaller aircraft and reduce congestion during northwest wind conditions, reducing the possibility of mistakes and potential for accidents.
275.3	Regional Transportation	Regional Airports	[Oppose Runway 14/32 because of] time is now to look for another area for an airport, while the land is still available and within reach financially.	Because the development of a second major airport would require ten to 15 years for site selection and environmental review, in addition to a multi-year construction period, this option is not viewed as a solution to accommodating forecast demand over the next 20 years. Hanscom Field's potential service area overlaps with the service areas for several airports that already have the necessary infrastructure for commercial service. These airports are the Hanscom Field, T.F. Green/Providence, and Worcester Regional, all which have had or are undergoing major improvements to their terminal buildings, other landside facilities and airfields.

Code	Topic 1	Topic 2	Comment	Response
276.1	Alternatives	Runway 14/32	I protest and oppose Runway 14/32...from noise pollution.	Operations in the vicinity of Hull increase with the Preferred Alternative primarily due to aircraft landing to the northwest, either on new Runway 32 or because of greater use of Runway 33L. However, the noise exposure levels resulting from these increased operations remains several decibels below 60 DNL as indicated by the specific point analysis at Site 26 in Tables 6.2-8, 6.2-9, 6.2-22, and E-1 of the Supplemental DEIS/FEIR. These levels are nearly 20 dB below the highest exposure in Winthrop and 15 dB below the exposure in parts of East Boston and Revere, which the new runway would help to improve.
276.2	Ecosystems	Rare Species	[Ms. Goode expresses concerns about the impact of Runway 14/32 on nesting osprey...common tern and arctic tern, which occasionally are present in Hull.] Hull has nesting osprey and some years common tern and occasionally an artic tern.	As evidenced by the extensive and varied bird population at Logan Airport, airport noise has not been found to be a significant deterrent to avian species. In fact, most airports find it necessary to manage the airfield in a manner to reduce the habitat attractiveness for birds. Furthermore, the addition of Runway 14/32 would not result in overflights to new areas in Hull. As such, the Preferred Alternative is not expected to have an adverse impact on osprey and tern populations in Hull.

277.1	Cumulative Impacts	Runway 14/32	I am opposed to Massport's plan to expand Logan Airport and build a new runway - 14/32...the proposed runway at Logan will more than double the flights over Hull each year, seriously impeding upon the quality of life for the residents of Hull.	The Supplemental DEIS/FEIR projects that the Preferred Alternative would promote runway use in a manner that is more consistent with annual PRAS goals, and Hull is affected by the use of Runway 33/32 arrivals. The total number of aircraft arriving to the northwest does increase with construction of the runway, but this is due to the PRAS goals more than any other factor. Since the Runway 33 arrivals that impact Hull approach primarily over water, and since Hull is further from the airport than those communities impacted by arrivals to Runway 15L/R, 4L/R, or 22L/R, the PRAS goals call for 42 percent of the equivalent arrivals to operate in this direction. Runway 33 arrivals accounted for approximately 27 percent of the equivalent arrivals in 1998, and since Logan Airport has a limited capacity in this direction, the northwest configuration has been underutilized as demand has increased over the years. Construction of the runway allows better achievement of the agreed-upon PRAS goals, but even with Runway 14/32, the equivalent arrivals in the Runway 33/32 direction never reach the goal of 42 percent under any fleet scenario or alternative. Operations in the vicinity of Hull increase with the Preferred Alternative primarily due to aircraft landing to the northwest, either on new Runway 32 or because of greater use of Runway 33L. However, the noise exposure levels resulting from these increased operations remains several decibels below 60 DNL as indicated by the specific point analysis at Site 26 in Tables 6.2-8, 6.2-9, 6.2-22, and E-1 of the Supplemental DEIS/FEIR. Boston, MA 02205

March 30, 1999

Dear Sir:

I feel the need to express my opposition to the Logan Airport runway expansion. My husband and I are senior citizens. After owning a business in Boston for many years, we have retired and purchased a home in Hull. We fell in love with the sea views, and the quiet slower-paced approach to life which we found here.

278.1

Prior to moving here last summer, we had lived in the North End of Boston. But the noise and pollution from the destruction and construction in that area took away all the beauty of the waterfront.

It would be a shame to have the same noise and air pollution here which we feel will come from increased flights over Hull as a result of an added runway.

Very sincerely yours,

Marjorie Rilleau Kallman

DRAFT EIR
Secretary of Environmental Affairs
Attention MEPA Office
Mr. Arthur Pugsley-EOEA No. 10458
100 Cambridge Street
20th Floor
Boston, MA 022025

Dear Mr. Silva:

Enclosed please find my reply to the Draft EIR for Massport's 14/32 runway project. I would like to note that the time allowed for comment was too short to permit much of what I would have liked to research. Given the complexity of the project, I think it's easy to see that 2 weeks is not a reasonable time to develop researched rebuttal arguments following hearings. The difficulty in my case was compounded by the fact that no copy of the EIR was available at the Hull Public Library, apparently because none was ever provided there by Massport. 279.1

Sincerely

Stephen Lathrop

COMMENTS OF STEPHEN LATHROP

ON

DRAFT EIR: EOAE NO. 10458

AND

DRAFT EIS: ANE-600

HULL GETS IT COMING AND GOING: THIS 747 WHICH FLEW NEARLY DIRECTLY ABOVE HULL HIGH SCHOOL AT ABOUT 1:00 PM ON APRIL 19, WAS THE LAST OF A STRING OF RUNWAY 33L ARRIVALS WHICH HAD BEEN DOING MORE OR LESS THE SAME THING SINCE BEFORE 6:00 AM. AIR CONTROLLERS AT LOGAN THEN SWITCHED TO RUNWAY 27 ARRIVALS, AND RUNWAY 22 DEPARTURES. THE RESULT IN HULL CAN BE SEEN IN THE PHOTO AT THE BACK OF THIS REPLY. LATER ON, CONTROLLERS SWITCHED BACK TO RUNWAY 33 ARRIVALS, AND THIS SCENE WAS REPEATED LONG INTO THE NIGHT. TO PERMIT ENOUGH VISUAL INFORMATION TO ESTABLISH THE LOCATION OF THIS SCENE, A WIDE ANGLE LENS WAS CHOSEN FOR THIS PHOTOGRAPH; ANOTHER EFFECT WAS TO MAKE THE AIRPLANE APPEAR MORE DISTANT THAN IT WOULD TO AN OBSERVER ON THE GROUND. THE RUNWAY 33L GLIDE SLOPE PUTS AIRPLANES IN THIS LOCATION AT AN ALTITUDE OF 1500 FEET OR LESS.

COMMENTS ON: EOEA #10458 AND ANE-600
LOGAN AIRSIDE IMPROVEMENTS PLANNING PROJECT
DRAFT ENVIRONMENTAL IMPACT STATEMENT/REPORT
WITH PARTICULAR REFERENCE TO NOISE IMPACTS
IN THE VICINITY OF HULL, MASSACHUSETTS

OPENING COMMENT

A *Boston Globe* report (March 2, 1999), based on Massport's projected data, shows that if Massport's new runway is approved, approximately 82,540 airplanes per year will fly low over Pemberton Point in Hull, the site of Hull High School. Almost all of these airplanes will fly within 1700 feet of the High School, many closer than 1600 feet. These distances are measured upward from the school to the airplanes themselves, not to the paths of the airplanes projected on the ground. No airplane on any runway ever comes so close to the FAA control tower at Logan airport. Massport's Report presents tables which, taken together, seem to assert that under such conditions noise at Hull High School would then be equivalent to that experienced by residents of a "Small Town Cul-de-Sac." 279.2

SUMMARY OF COMMENTS

There are 5 principal objections to acceptance of the *Draft Environmental Impact Statement/Report* contained in this reply: (1) that the Report fails to study noise impacts in the vicinity of Hull, Massachusetts, even though such study is warranted and mandated; (2) that data presented in the report which appear to justify the exclusion of Hull from the study area are in fact incorrect and insufficiently documented, and that noise modeling methods used by Massport to exclude Hull from the study area are also incorrect and insufficiently documented; (3) that exclusion of Hull from the study area forecloses consideration of the harm which Massport's runway expansion plans might do to future noise abatement using new technology in the vicinity of Hull; (4) that operation of

the proposed runway is likely to cause shifts in air traffic patterns which will cause more airplanes to fly over Hull, but this possibility is not examined in the Report; (5) that the people of Hull have not been adequately notified of Massport's plans because no copy of the report has been delivered to the Hull Public Library.

SUMMARY OF OBJECTION 1: The *Draft Environmental Impact Statement/Report*, hereafter called the Report, is inadequate because it fails to study noise impacts in the vicinity of Hull, Massachusetts. There are compelling reasons to believe that Hull meets the criteria for study established by Massport and by Federal regulations. Accordingly, the Report should not be accepted as written.

Reasons to believe that Hull falls within the mandated study area are the following:

1. In *Volume IV* of the report, containing Technical Appendices L–O, numerous figures appear which place Hull on the very edge of the study area modeled by Massport as the area within the 60 dB DNL contour. This suggests that even small data or modeling errors, if corrected, might put Hull within the mandated study area.

279.3

2. Actual noise measurements at Hull High School, where Massport has for years maintained a noise monitoring station, contradict the Report's noise projections. The Report places Hull outside the 60 dB noise contour adopted by Massport as the threshold for environmental study. The historical measurements say Hull is already deeply within the contour, although it has yet to experience the increase in aircraft operations projected by the Report.

According to Massport data, noise measurements at Hull High School, after adjustment to remove exceptional noise events such as winter storms, exceeded 60dB in each of a sample of 24 summer months save one, and in all of a sample of 23 winter months without exception. The monthly measurements were for the summer months June, July, and August, and the winter months December, January, and February, beginning in June of 1991 and ending with February 1999.

The highest monthly average measurement result was 68.4dB in February of 1992, the lowest 59.7dB in August of 1997, the only figure below 60dB. All figures

were monthly averages. Of these monthly averages, 13 exceeded 65dB, mostly in the years before 1996, but also twice in 1997.

The general pattern of the figures seems to show a decline in monthly noise from 1991 to 1996, followed by an apparent increase in 1998. There are only 2 months in the 1999 sample and these are lower than the equivalent 1998 years, but still far above the 60dB threshold at 63.4dB and 63.9dB.

Perhaps more to the point, Massport has recently begun measuring what it thinks is the actual contribution of noise from airplanes at Hull High School. This involves the removal of other noise sources from the overall noise measurement to derive an airplanes-only figure. Such figures are now available for months starting in January 1998 and ending with January 1999. These are Massport's monthly average airplanes-only noise levels at Hull High School: January 1998: 59.2dB; February 1998: 58.5 dB; March 1998: 59.4dB; April 1998: 59.3dB; May 1998: 58.6dB; June 1998: 59.3 dB; July 1998: 59.5dB; August 1998: 57.7dB; September 1998: 59.2dB; October 1998: 59.8dB; November 1998: 59.8dB; December 1998: 59.8dB; January 1999: 59.5dB. These figures, which represent only noise which can be correlated with specific aircraft operations, establish clearly that an increase in aircraft operations much smaller than the Report's Preferred Alternative would put Hull within the 60dB contour on the basis of airplane-related noise alone.

Probably, however, the figures noted in the previous paragraph are too small, and Hull is already within the 60dB contour on the basis of aircraft noise, if that could be properly measured. Hull's unique location in Boston's air traffic pattern complicates correlation of aircraft operations with noise monitor data, something which anyone who wishes to isolate and remove background noise must do. Unfortunately, in Hull, background noise is airplane noise.

The noise monitor at Hull High School is commonly affected by 4 or more jet operations simultaneously, because airplanes departing Logan via Runways 22L/R fly a semicircular pattern around the monitor. It is an ordinary occurrence to see one jet approaching the monitor from the west over Boston Harbor, while another, which has just passed the monitor, turns south over Nantasket Beach, as yet another, which preceded the first off the runway at Logan by perhaps 90 seconds, turns west over Hull Bay and approaches once more toward the monitor on the side opposite its original pass. In addition, takeoff thrust and thrust reversals at Logan

itself are often clearly audible at Hull High School, and sometimes they are loudly audible. It seems unlikely that all of this noise activity can be successfully correlated to specific aircraft operations; perhaps only one operation at a time can be so correlated. If so, then a large aircraft-related noise component is being assigned to background noise, and all of the figures which Massport has computed for airplanes-only noise are smaller than they should be.

To think of the problem another way, consider this: without Logan and its airplanes, Hull Village would surely be one of the quietest communities in eastern Massachusetts. Hull Village has no commercial zone, so trucks are rarely seen on its streets. It doesn't have through traffic, because no one can drive through Hull Village, only to it, or from it; it is on the end of a small peninsula. There isn't any industry to make noise. And yet a noise monitor in Hull Village stays constantly above 60dB, often pushing 65dB. According to the Report's Figure 5.2-2 a typical small town suburban environment ought to measure somewhere in the high 40s. There isn't any obvious reason why Hull Village would be any noisier, except Logan Airport.

3. The Report contains significant data errors. The flight tracks offered by the Report to represent the historical pattern of aircraft operations in the vicinity of Hull do not reasonably approximate the patterns of aircraft operations in the vicinity of Hull during the previous 10 years, nor at the present time.

Figures 5.2-5, 5.2-6, 6.2-1, and 6.2-3, which purport to show the historical and projected paths of aircraft in the vicinity of Hull are all drawn in such a way that no aircraft are shown crossing the upper end of the Hull Peninsula. In a brief course of observation which I conducted on Saturday, April 17, between the hours of 11:43 a.m. and 12:35 p.m., (when observation was interrupted by rain), and again between 5:53 p.m. and 6:28 p.m., I observed 31 airplanes which departed Logan on Runway 22 and then flew toward Hull. Of these, 4 flew directly over the upper end of the Hull Peninsula, and 4 more skirted its shoreline so closely that essentially nothing of either side of these airplanes could be seen as I stood on the seawall. I have documented these observations photographically.

In another brief course of observation which I conducted on Monday, April 19, between the hours of 8:22 a.m. and 10:15 a.m. I observed in the vicinity of Hull

Gut as 34 airplanes approached runway 33L. Of these, all but one flew directly over the end of the Hull Peninsula or skirted its shoreline so closely that essentially nothing of either side of these airplanes could be seen from my point of observation on the shoreline at Hull Gut. I have documented these observations photographically as well.

On the basis of personal experience gathered while living for 10 years in Hull Village, which is on the end of the Hull Peninsula, I estimate that these two observation sessions fairly represent the usual pattern of aircraft operations to be found there, although the accuracy of the conclusions could surely be improved by more extensive observations, or better yet by study of FAA radar track data.

All of the airplanes noted in these two observations sessions were jet airplanes; I saw many turboprop airplanes during the second observation session, but they were not counted for the purpose of these comments.

There is nothing in the Report to suggest that planned changes will cause future aircraft operations in the vicinity of Hull to conform to the patterns of operation presented by the Report. These inaccurately presented patterns of operation are identified in the Report as the basis of Massport's modeling of both historical and projected noise in the vicinity of Hull.

4. The actual patterns of aircraft operations in the vicinity of Hull bring aircraft closer to Hull, and over Hull, more often than the Report's modeling data show. This raises noise levels in Hull above those shown by the Report's modeling.

5. The actual patterns of aircraft operations in the vicinity of Hull are not as dispersed as the Report's modeling data show. The more concentrated actual character of these operations tends to raise noise levels in the vicinity of Hull as compared to the Report's modeled operations.

6. The Report presents no actual measurements of airplane noise in Hull, even though Massport has operated noise measurement equipment in Hull for many years, a fact which is noted in the Report. Citing actual historical measurements of high noise levels in Hull would call into question the validity of the noise modeling results presented by the Report.

7. The report presents modeled estimates of airplane noise in Hull, but these estimates appear to defy common sense, and also contradict measurements actually made in the past. For instance, Figure 5.2-2 in the Report (Typical Outdoor Day/Night Sound Levels (dB)) presents a graph which indicates that 54dB is a typical DNL sound level for a "Small Town Cul-de-Sac." In Volume IV of the Report a table appears (Table 2.3, Day-Night Sound Level Values (Ldn) in dB From Flight Operations at 23 Selected Locations, 2010 37.5 Million Low). This table presents modeled sound levels for Hull High School under Massport's Preferred Alternatives, Alt 1 and Alt 1A. Sound levels under both alternatives are shown to be 54.6 dB, essentially as quiet as the small town cul-de-sac of Figure 5.2-2.

It is difficult to credit the notion that Hull High School, which would then be experiencing more than 100,000 equivalent air operations a year, the majority of them low-level overflights and near-overflights at altitudes under 1600 feet, would then be as quiet as a small town cul-de-sac. Hull High School is not that quiet now. Massport has sound measurement data collected throughout the 1990s which show much higher monthly noise levels at Hull High School produced by many fewer equivalent operations. These data are discussed briefly under Number 2 above, but they are not published in the Report. The Report does not discuss these contradictions.

SUMMARY OF OBJECTION 2: Methods used by Massport to develop data for the Report are not sufficiently documented. This makes it impossible to assess the likelihood that the data used accurately represent the cases they are claimed to represent. Even if the data are accurate and representative, the methods used by Massport to process the data into noise models are largely undocumented. The Report does not allow a reasonable person to assess whether the resulting noise models accurately reflect the data inputs. Some data presented in the Report could lead to a conclusion that the modeling software used by Massport lacks the sophistication necessary to model accurately the complex noise situation in the vicinity of Hull. For these reasons too, the Report should not be accepted as written. 279.4

Reasons to question the Report's noise modeling data and methods are the following:

1. In its modeled flight tracks for arrivals and departures, past and future, the Report shows multiple flight paths per runway. The Report is vague about the basis for choosing the particular tracks shown. It offers no explanation of whether these tracks represent sampled actual tracks of real flights, or composites, nor any discussion of whether the tracks properly represent particular seasonal conditions and states of airport activity. The Report also does not indicate whether all tracks from each runway are weighted equally when computing noise models.

2. In some areas near Hull flight tracks from different runways are shown intermingling. One such case involves takeoffs from Runway 22L, Runway 22R, Runway 15R, and Runway 9, as shown in Figure 5.2-5 (Modeled Departure Flight Tracks for Existing Runway Configurations) In all, 20 tracks seem to be involved, five per runway (the quality of Massport's presentation of these tracks is so poor that track count must remain an estimate), of which 17 intermingle. The Report does not answer this question: In computing noise models in the intermingled area, does each track from each runway count equally? Runway 15R sees very few departures; Runways 22L and 9 are the busiest departure runways at Logan. Even assuming that all the tracks are properly located, if they are not weighted properly to reflect the different intensity of traffic each track experiences there will be distortions in any resulting noise model. If these tracks are weighted equally, the resulting distortion would tend to improperly move modeled noise away from Hull.

3. Figure 5.2-6 in the Report (Modeled Arrival Flight Tracks for Existing Runway Configurations) shows most arriving flights destined for Runway 33L crossing either the Northern end of Peddocks Island or the western side of Hull Gut. None are shown crossing the end of the Hull Peninsula.

An electronic beacon marking the approach path for Runway 33L is located on the end of the Hull Peninsula, and is approximately 500 yards east of the easternmost point on Peddocks Island. The Report does not answer the obvious question: why would arriving airplanes destined for Runway 33L be more likely to fly above Peddocks Island than above the beacon put on the Hull Peninsula for that purpose?

If the Report has misrepresented the approach situation at Hull Gut, as seems obvious, then correcting that misrepresentation would result in a noise model that would predict more noise in Hull.

4. Figure 5.2-6 (Modeled Arrival Flight Tracks for Existing Runway Configurations) shows a broad fan of 10 approach paths which converge at a point over Boston Harbor, about a mile northwest of the end of the Hull Peninsula. Opposite Hull Gut this fan is shown with a width of approximately .6 mile.

Visual observation at Hull Gut shows that a large majority of airplanes destined for Runway 33L have already converged along an axis southeast of Hull Gut before overflying the end of the Hull Peninsula at Hull Gut. With the sun standing in the south southeast, directly behind approaching airplanes, it is possible for an observer to sit still on the cobbled beach while the shadow of airplane after airplane passes over her.

Rather than being fanned out as shown in Figure 5.2-6, airplanes cross the end of the Hull Peninsula in an intensely focused stream. This pattern of operation, which requires no special equipment or expertise to observe, if entered as data into noise modeling software, would yield larger noise values for Hull than the fan of approach tracks presented by the Report.

5. The fan of approach tracks for Runway 33L at Hull Gut, which is presented in Figure 5.2-6 in the Report, is marked by a dog-leg a short distance before the point of convergence. The Report shows no similar dog-leg in the approach tracks to any other runway. The Report offers no explanation for the dog-leg shown on the approach to Runway 33L. There is no apparent purpose for a dog-leg in that position. If the dog-leg were not present in the modeled approach path for Runway 33L, the resulting noise model would predict more noise in Hull.

6. When arrivals are destined for Runway 33L, residents of Hull Village, near the end of the Hull Peninsula, usually experience multiple direct overflights per hour, but Figure 5.2-6 shows no arrival paths crossing Hull Village. If direct overflights of Hull Village were among the modeled approach tracks for Runway 33L the resulting noise model would predict more noise in Hull.

7. Figure 5.2-5 of the Report (Modeled Departure Flight Tracks for Existing Runway Configurations) shows a large number of modeled flight tracks from 4 runways intermingling over Boston Harbor north of Hull. Some of the difficulties of this modeling situation were noted in Number 2 above.

Another question arises because of the locations of the tracks themselves. Among 15(?) tracks departing Runway 22L, 22R and 15R, the Report shows no track directly over Hull Village. Overflights of Hull Village are a common occurrence, usually seen multiple times per hour, and sometimes nearly continuously, whenever Runways 22L and 22R are used for departures. The Report shows 1 track skirting the north shore of the Hull Peninsula, and 2 in the vicinity of the south shore of Georges Island, approximately .8 nautical mile north of Hull. The Report shows 4 modeled paths distributed northward from the middle part of Lovell's island, 1.5 nautical miles north of Hull

The visual observations discussed above make it seem doubtful that many airplanes from 22L and 22R fly so far north. If Massport's noise modeling software assigns equal weight to each of these tracks, then Figure 5.2-5 shows modeling inputs that seem to under-represent the number of flights which travel close to Hull, or over Hull, while over-representing those that miss Hull by a large distance. Correcting such a misrepresentation would result in a noise model which would predict more noise in Hull.

8. Although Massport has access to Federal Aviation Administration radar tracking data, no statistical samples of such data appear in the Report. A statistically rigorous sampling of FAA radar tracks, presenting cases to represent common airport operating conditions, would provide the soundest possible basis for noise modeling because it would provide a historically based and geographicall accurate characterization of the patterns of aircraft operation around Logan Airport. and in the vicinity of Hull. The fact that Massport has not documented a statistically rigorous application of this obviously powerful tool calls into question the validity of all the flight track data upon which the Report's noise modeling is based.

9. Close examination of the noise contours produced by Massport's noise modeling software shows striking failures to predict obvious and inescapable noise effects that

would be not only apparent, but even intrusive, for most observers. For instance, Volume IV of the Report presents numerous graphical representations of modeled noise contours. One presentation, titled "Day-Night Sound Level Contours 2010 49M High, Alternative 1," shows perfectly symmetrical sound contours at the departure end of Runways 22L and 22R. The fact that 109,000 equivalent departures (Volume III, "Aircraft Operations by Fleet, Alternative, Runway End and Operation" , otherwise unnumbered and unpaginated) are modeled to make sharp left turns over Castle Island seems completely unrecorded in any of the contours except (possibly) the 60 dB contour, which bulges almost imperceptibly near Thompson Island. However technically accurate this model might or might not be, it seems obvious that in this case it has produced a result that would confound the expectations of any human observer with normal hearing.

Similarly, the contours projecting from the departure end of Runway 15 remain undisturbed by the substantial cross-traffic of Runway 22 departures, but a human observer on a boat in the vicinity would surely find the noise intrusive. If Massport's modeling program does not make models which closely match real human experience, then the presence of those models in this Report should be a reason to reject the Report as misleading.

SUMMARY AND CONCLUSION OF OBJECTION 3: Previously, representatives of Massport and of the Federal Aviation Administration have offered the prospect that future technological improvements would facilitate more efficient noise abatement in the vicinity of Hull. The Report does not discuss such future improvements and it seems reasonable to believe that implementation of the Preferred Alternative would complicate or preclude their implementation. 279.5

One technology so mentioned was the application of approach procedures based on the satellite-based Global Positioning System to Runway 33L, guiding incoming airplanes farther from Hull along curved approach paths. It seems possible that construction of Runway 14/32 would complicate or preclude such an improvement, but the issue of Global Positioning System approach paths is not discussed in the Report.

Another approach to the same goal would be to install glide slope and locator electronics on Thompson Island, to project their beacons eastward over Shag Rocks.

Under VFR conditions such an installation would enable an accurate approach to Runway 33L that begins as a westward leg roughly parallel to the north shore of Hull, but offset more than a mile to the north. This track intersects the current approach path at its current altitude almost 3 miles from the touchdown point on 33L. A 55 degree turn at the point of intersection would put airplanes on the current track, to land as they always have. This proposed new track is almost perfectly parallel to Runway 9/27, and more than 3 miles south of a line projected eastward from Runway 9. Use of such an approach would enormously benefit the people of Hingham, Hull, and Weymouth, who would all be freed of probably half or more of the airplane noise they now experience, while adversely affecting no one. Unfortunately, this approach path would also put incoming airplanes on an intersecting course with airplanes approaching projected Runway 32, so construction of 14/32 might preclude or complicate future implementation of this improvement. There is no discussion of these issues in the Report. For this reason too, the Report should not be accepted as written.

SUMMARY AND CONCLUSION OF OBJECTION 4: It seems reasonable to suppose that construction of Runway 14/32 would alter existing patterns of aircraft operations, as both air controllers and pilots adjusted to the presence of a new factor in the navigational mix. As can be seen by comparing Figures 6.2-2 and 6.2-3 with Figures 5.2-5 and 5.2-6, the Report asserts that jet operations in the vicinity of Hull will continue to follow the tracks they have used historically, except that new tracks will be added to the west of the present inbound approach to Runway 33L. 279.6

The inaccuracy of the tracks presented in all four of these figures has already been discussed. With regard to the tracks of inbound airplanes destined for Runway 33L, FAA radar tracking data which is available from Massport reveal what may be a relevant point: airplanes headed for the axis of the Runway 33L approach-path from the west do so at oblique angles; those from the east much more nearly at right angles.

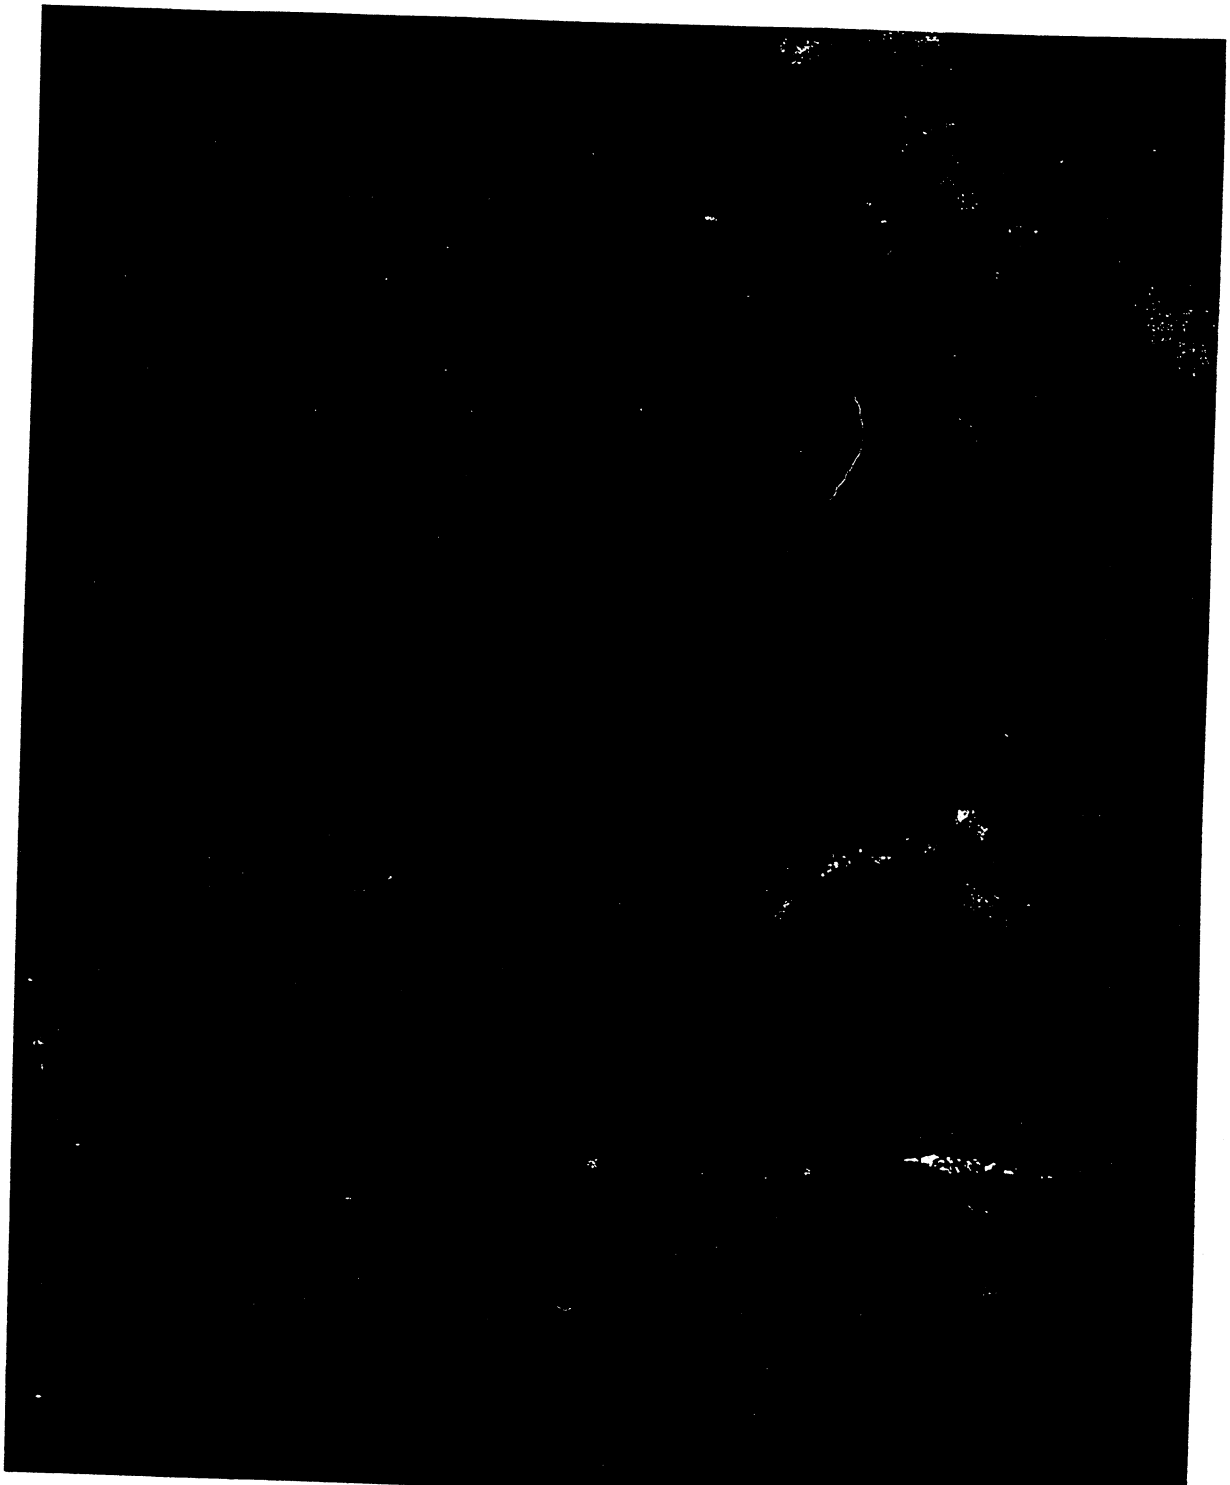
If an approach path to Runway 32 is established as shown in the Report, approximately 1 mile to the west of 33L, it seems logical to suppose that use of the approach to 33L might change in the following ways: First, airplanes which might previously have approached the 33L axis from the west might then choose to

approach from the east, to avoid crossing the paths of airplanes destined for Runway 32. Because many airplanes which approach 33L from the east fly directly over Hull, as the FAA data show, such a change would add to noise in Hull. Second, pilots approaching from the east might choose to use more oblique approach angles than they now do, in the hope that they would thereby reduce the danger of overshooting the axis of the Runway 33L approach path and straying too close to airplanes approaching Runway 32. This would have the effect of directing the tracks of these airplanes more nearly parallel to the axis of the Hull Peninsula, keeping the airplanes over Hull for longer times and distances, and causing them to descend to lower altitudes during their overflights. Noise in Hull would increase as a result.

Neither of these plausibly foreseeable effects is addressed by the Report. For this reason too, the Report should not be accepted as written..

SUMMARY AND CONCLUSION OF OBJECTION 5: The people of Hull have not been adequately notified of Massport's plans regarding Runway 14/32, nor have they had sufficient opportunity or time to respond to the Report. A document accompanying the Report (RE: Transmission of Draft Environmental Impact Statement and Draft Environmental Impact Report ("Draft EIS/EIR") and signed by Betty J. Desrosiers and John C. Silva states on its second page: "The document will be made available for public review at local libraries in the following communities: Boston, Braintree, Brookline, Cambridge, Chelsea, Everett, Hingham, Hull, Melrose, Milton, Quincy, Revere, Somerville, Swampscott, Weymouth, and Winthrop." On April 19, 1999 librarians at the Hull Public Library said this had not yet been done in the case of Hull. For this reason, the Report should not be accepted until the people of Hull have had adequate notification, time, and opportunity to respond to the Report.

279.7



HULL HIGH SCHOOL AGAIN: ALTHOUGH NOT AS VISUALLY IMPOSING AS THE 747 SHOWN AT THE FRONT OF THIS REPLY, THE AIRPLANE IN THE UPPER LEFT OF THIS PHOTOGRAPH, IS USING EXTRA THRUST TO CLIMB OUT OF LOGAN, AND WAS EVEN LOUDER ON THE GROUND—AND THE 747 WAS PLENTY LOUD. THIS RUNWAY 22 DEPARTURE WAS THE VERY NEXT FLIGHT AFTER THE 747 LANDING. THESE TWO PHOTOS ARE A NICE PAIR OF BOOKENDS TO SHOW THE UNIQUELY CONTINUOUS NATURE OF AIRPLANE NOISE IN HULL. THESE PHOTOS ARE PERFECTLY TYPICAL OF WHAT HAPPENS CONSTANTLY IN HULL, ALTHOUGH SOMEONE LOOKING AT THE GRAPHICS IN MASSPORT'S REPORT MIGHT CONCLUDE THAT IT WOULD BE A RARE EVENT FOR AIRPLANES TO BE IN THE LOCATIONS HERE, WHERE THEY WERE PHOTOGRAPHED. THIS AIRPLANE CLOSELY SKIRTED THE SHORELINE; MANY OTHER RUNWAY 22 DEPARTURES FLY WELL TO THE RIGHT, DIRECTLY OVER HULL VILLAGE.

Code	Topic 1	Topic 2	Comment	Response
279.1	Environmental Review Process	Public Process	...the time allowed for comment was too short to permit much of what I would have liked to research...2 weeks is not a reasonable time to develop researched rebuttal arguments following hearings. The difficulty in my case was compounded by the fact that no copy of the EIR was available at the Hull Public Library, apparently because none was ever provided there by Massport.	A copy of the Supplemental DEIS/FEIR will be available at the Hull Public Library.
279.2	Noise	Imapcts	A Boston Globe report (March 2, 1999), based on Massport's projected data, shows that if Massport's new runway is approved, approximately 82,540 airplanes per year will fly low over Pemberton Point in Hull, the site of Hull High School. ...[Many] of these airplanes will fly within [1600 or] 1700 feet of the High School...[as] measured...from the school to the airplanes... Massport's Report presents tables which...seem to assert that under such conditions noise at Hull High School would then be equivalent to that experienced by residents of a "Small Town Cul-de-Sac."	Operations in the vicinity of Hull increase with the Preferred Alternative primarily due to aircraft landing to the northwest, either on new Runway 32 or because of greater use of Runway 33L. However, the noise exposure levels resulting from these increased operations remains several decibels below 60 DNL as indicated by the specific point analysis at Site 26 in Tables 6.2-8, 6.2-9, 6.2-22, and E-1 of the Supplemental DEIS/FEIR. These levels are nearly 20 dB below the highest exposure in Winthrop and 15 dB below the exposure in parts of East Boston and Revere, which the new runway would help to improve.
279.3	Noise	Model	The Draft Environmental Impact Statement/Report...fails to study noise impact in the vicinity of Hull...There are compelling reasons to believe that Hull meets the criteria for study established by Massport and by Federal regulations...[including: noise measurements at Hull High School that consistently exceed 60 dB and approach 60 dB in noise directly attributable to specific airport operations. Observations of aircraft indicate many low-altitude over flights, and near over flights, which are not presented in the report. Noise monitors in Hull Village consistently exceed 60 dB with no contributing factors except Logan Airport. The report contains no noise measurements for Hull.]	The Supplemental DEIS/FEIR projects that the Preferred Alternative would promote runway use in a manner that is more consistent with annual PRAS goals, and Hull is affected by the use of Runway 33/32 arrivals. The total number of aircraft arriving to the northwest does increase with construction of the runway, but this is due to the PRAS goals more than any other factor. Since the Runway 33 arrivals that impact Hull approach primarily over water, and since Hull is further from the airport than those communities impacted by arrivals to Runway 15L/R, 4L/R, or 22L/R, the PRAS goals call for 42 percent of the equivalent arrivals to operate in this direction. Runway 33 arrivals accounted for approximately 27 percent of the equivalent arrivals in 1998, and since Logan Airport has a limited capacity in this direction, the northwest configuration has been underutilized as demand has increased over the years. Construction of the runway allows better achievement of the agreed-upon PRAS goals, but even with Runway 14/32, the equivalent arrivals in the Runway 33/32 direction never reach the goal of 42 percent under any fleet scenario or alternative. Operations in the vicinity of Hull increase with the Preferred Alternative primarily due to aircraft landing to the northwest, either on new Runway 32 or because of greater use of Runway 33L. However, the noise exposure levels resulting from these increased operations remains several decibels below 60 DNL as indicated by the specific point analysis at Site 26 in Tables 6.2-8, 6.2-9, 6.2-22, and E-1 of the Supplemental DEIS/FEIR. These levels are nearly 20 dB below the highest exposure in Winthrop and 15 dB below the exposure in parts of East Boston and Revere, which the new runway would help to improve.

Code	Topic 1	Topic 2	Comment	Response
279.4	Noise	Model	Methods used by Massport to develop data for the Report are not sufficiently documented [including: representatives of flight tracks that are presented without adequate basis, representations of flight tracks over the beacon on Hull Peninsula, Flight paths that converge over Hull Peninsula rather than over Boston Harbor, flight paths with inexplicable dog leg patterns, omission of over-flights experienced in Hull, and failure to predict obvious noise effects]. This makes it impossible to assess...[whether] the data...accurately represents the cases they are claimed to represent....the methods used by Massport to process the data into noise models are [also] largely undocumented. The Report does not allow a reasonable person to assess whether the resulting noise models accurately reflect the data inputs. Some data presented in the Report could lead to a conclusion that the modeling software used by Massport lacks the sophistication...to model accurately the complex noise situation in the vicinity of Hull.	Refer to response to Comment 279.3.
279.5	Noise	Impacts	...representative of Massport and of the Federal Aviation Administration have offered the prospect that future technological improvements would facilitate more efficient noise abatement in the vicinity of Hull. [For instance, using GPS to guide incoming flights along curved flight paths and installation of guide slope and locator electronics on Thompson Island to assist in off-setting approach paths, by more than 1 mile to the north.] The Report does not discuss such future improvements and it seems reasonable to believe that implementation of the Preferred Alternative would complicate or preclude their implementation.	Use of GPS in both arrival and departure procedures is beginning to be utilized but is still a relatively new technology. When it does come into wider use (both as instrumentation onboard the aircraft as well as in published procedures used by Air Traffic Control), it may well allow more versatile routing of traffic north of Hull. However, it is not a part of this assessment.
279.6	Noise	Runway 14/32	It seems reasonable to suppose that construction of Runway 14/32 would alter existing patterns of aircraft operations...the Report asserts that jet operations in the vicinity of Hull will continue to follow the tracks they have used historically, except that new tracks will be added to the west of the present inbound approach to Runway 33L. [Based on FAA tracking data, it appears that the new runway configuration would result in different approach paths, increasing approaches from the east and affecting Hull more.]	Operations in the vicinity of Hull increase with the Preferred Alternative primarily due to aircraft landing to the northwest, either on new Runway 32 or because of greater use of Runway 33L. However, the noise exposure levels resulting from these increased operations remains several decibels below 60 DNL as indicated by the specific point analysis at Site 26 in Tables 6.2-8, 6.2-9, 6.2-22, and E-1 of the Supplemental DEIS/FEIR. These levels are nearly 20 dB below the highest exposure in Winthrop and 15 dB below the exposure in parts of East Boston and Revere, which the new runway would help to improve.
279.7	Environmental Review Process	Public Process	The people of Hull have not been adequately notified of Massport's plans regarding Runway 14/32, nor have they had sufficient opportunity or time to respond to the Report. [The report was not made available to the Hull Library.}	The Supplemental DEIS/FEIR will be available at the Hull Public Library. Everyone who wrote a comment letter will be notified of the availability of the Supplemental DEIS/FEIR.

LETTER 280

March 28, 1999

Mr. Arthur Pugsley
Secretary of Environmental Affairs
100 Cambridge Street
Boston, MA 02205

Dear Mr. Pugsley:

We are writing to you in an effort to protect the quality of life in Hull, which is being threatened by the proposition of building runway 14/32 at Logan Airport. The proposed runway would more than double the present number of planes flying over Hull overstressing the area. The constant plane traffic will ruin several beautiful and thriving neighborhoods in Hull along with other communities in the greater Boston area already shouldering the burden of constant noise and pollution caused by heavy air traffic. I am not alone in opposing the constant push to expand Logan's air traffic capacity. We hope that the interests of residents preside over the narrow, short term, solution of Massport and the business community. We are all gearing up for a fight and hope to have your support.

280.1

Sincerely,

Daniel Llewellyn

LETTER 281

Dr. Jo Loughnane
Fifty Andrew Avenue
Hull, Massachusetts 02045

April 19, 1999

Gentlemen:

281.1

I am opposed to the proposed runway 14/32 at Logan. I endorse the Worcester plan.

I also oppose the money spent on your ad campaign. Why should the convenience of Logan users be based on the environment of Hull residents?

Sincerely,
Jo Loughnane

LETTER 282

April 19, 1999

To Whom It May Concern:

I am a resident of 8 HarborView Road Hull, Ma. I am writing to inform you of disapproval of runway 14/32

I have lived at this address for 3 ½ years and I still wake up every night because a jet has flown too low and the noise is very loud. I have called numerous times to Massport Noise Abatement, however I feel that my complaints means nothing. How will I live with additional Noise Pollution!! 282.1

At times we lie in bed and the lights from the jets actually shines in my children's and my own eyes.

Hopefully the new runway will receive enough negativity to stop the once quiet and remote town of Hull.

Sincerely,

Jeannette MacDonald

283.1	Noise	Impacts	Opposes Runway 14/32 because of noise, low flying planes.	The Supplemental DEIS/FEIR projects that the Preferred Alternative would promote runway use in a manner that is more consistent with annual PRAS goals, and Hull is affected by the use of Runway 33/32 arrivals. The total number of aircraft arriving to the northwest does increase with construction of the runway, but this is due to the PRAS goals more than any other factor. Since the Runway 33 arrivals that impact Hull approach primarily over water, and since Hull is further from the airport than those communities impacted by arrivals to Runway 15L/R, 4L/R, or 22L/R, the PRAS goals call for 42 percent of the equivalent arrivals to operate in this direction. Runway 33 arrivals accounted for approximately 27 percent of the equivalent arrivals in 1998, and since Logan Airport has a limited capacity in this direction, the northwest configuration has been underutilized as demand has increased over the years. Construction of the runway allows better achievement of the agreed-upon PRAS goals, but even with Runway 14/32, the equivalent arrivals in the Runway 33/32 direction never reach the goal of 42 percent under any fleet scenario or alternative. Operations in the vicinity of Hull increase with the Preferred Alternative primarily due to aircraft landing to the northwest, either on new Runway 32 or because of greater use of Runway 33L. However, the noise exposure levels resulting from these increased operations remains several decibels below 60 DNL as indicated by the specific point analysis at Site 26 in Tables 6.2-8, 6.2-9, 6.2-22, and E-1 of the Supplemental DEIS/FEIR. These levels are nearly 20 dB below the highest exposure in Winthrop and 15 dB below the exposure in parts of East Boston and Revere, which the new runway would help to improve.

LETTER 284

Attention: MEPA Office
Mr. Arthur Pugsley-EOEA No. 10458
100 Cambridge Street 20th Floor
Boston, Massachusetts 02205

Dear Mr. Pugsley:

I am writing to you in response to the proposed runway at Logan Airport. I am for the expansion of Logan airport 100%; however, the effect of the runway to my neighborhood in Hull might negate any benefit. As I understand, the flight pattern would fly planes directly over the length of Hull. I believe this would lesson the quality of life in Hull by adding noise pollution. Hull already has at least 70,000 flights causing noise and air pollution. The proposed runway would add 50,000 more [illegible] happens not only would our quality of life suffer, but our property val[illegible]l. 284.1 284.2

Already in Hull the schools [illegible] ion. There is a flight pattern that flies almost directly ove[illegible] in attendance at Hull High there were numerous times tha[illegible]. The additional runway would direct flights directly over thre[illegible] not acceptable and neither is the new proposed runway.

DRAFT

We are a small, quite, working [illegible] community and I feel that the state is targeting Hull because we are in a lower social economic class then other towns. Please do not disrupt our peaceful town. 284.3

Sincerely,

Kimberly Iris Mills

Secretary of Environmental Affairs
Attention: MEPA Office
Mr. Arthur Pugsley - EOEA No. 10458
100 Cambridge Street - 20th Floor
Boston, Massachusetts 02205

Gentlemen:

I write in opposition to the construction of Runway 14/32 at Logan Airport.

The proposed expansion of Logan follows from the conclusion that the Boston metropolitan area needs more space for increased air traffic. I have no basis for doubting the assumption. However, I think it makes no sense to burden the people who live in existing flight corridors with more noise and pollution. Instead, why not do what other cities faced with similar concerns have done?

New York has three major airports. Houston has three (note that Houston has taken advantage of the closed military airport at Ellington Field south of the city). Dallas has two (note that DFW is further away in time than Worcester), Chicago has two. Washington-Baltimore boasts three. So why don't we build a new regional airport like Denver? Or use Hanscom. Or why not make Worcester Airport an alternative destination by building an access route to it from the Mass Pike? 285.1

Runway 14/32's flight path will put aircraft directly over the Hull peninsula thereby exacerbating the already pervasive noise which makes routine conversation outdoors (and sometimes indoors as well) impossible. I believe we Hullonians suffer enough in support of Logan Airport as it is, so let's share the burden for expanding capacity for air travelers with other airports within the region or build a new airport. 285.2

Please don't build Runway 14/32 and degrade my life. Thank you.

Sincerely,

William M. Reid

285.1	Regional Transportation	Regional Airports	...why don't we build a new regional airport like Denver? Or use Hanscom. Or why not make Worcester Airport an alternative destination by building an access route to it from the Mass Pike?	Because the development of a second major airport would require ten to 15 years for site selection and environmental review, in addition to a multi-year construction period, this option is not viewed as a solution to accommodating forecast demand over the next 20 years. Hanscom Field's potential service area overlaps with the service areas for several airports that already have the necessary infrastructure for commercial service. These airports are the Hanscom Field, T.F. Green/Providence, and Worcester Regional, all which have had or are undergoing major improvements to their terminal buildings, other landside facilities and airfields. The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR, specifically considered the role of Hanscom Field in the analysis of regional alternatives. Hanscom Field, which serves as a general aviation reliever airport to Logan Airport, already accommodates a significant number of aircraft operations (183,000 operations in 1998). The Hanscom Field activity includes private, business, charter, and air taxi operations that might otherwise use Logan Airport. Since the Airside Project Draft EIS/EIR was filed, Shuttle America, a newly founded airline, began commercial scheduled operations at Hanscom Field, offering limited turboprop services to short-haul regional markets – Trenton, Buffalo, Hartford (discontinued), Wilmington, Delaware (discontinued), and Greensboro. Shuttle America is also conducting operations between Hanscom and New York LaGuardia Airport. While Massport supports commercial service at Hanscom Field consistent with its established limits (60 seat regulation), Massport believes that Hanscom Field will maintain its role as a major general aviation reliever, and that its geographic proximity to Logan, Worcester Regional and Manchester airports will prevent its development as a significant commercial airport. Additionally, commuter airlines serving Logan Airport are unlikely to move a significant number of flights from Logan Airport to Hanscom Field, since approximately 50 percent of passengers on Logan Airport's commuter flights connect to other Logan Airport flights and a significant number of passengers are travelling to Boston. However, any new commercial service initiatives proposed for Hanscom Field shall be reviewed for consistency with the *Hanscom GEIR* (HGEIR) and its Annual Updates, and shall be considered by the Hanscom Area Town Selectmen (HATS). Refer to Section 2.6 of the Supplemental DEIS/FEIR for a discussion of Hanscom Field. Massport supports improved access to the Worcester Regional Airport. Refer to Chapter 2 of the Supplemental DEIS/FEIR for the status of the Worcester Access Road project.

LETTER 286

Secretary of Environmental Affairs
Attention: MEPA Office
100 Cambridge Street 20th Floor
Boston MA 02205

April 16, 1999

Dear Mr. Pugsley:

I am writing in opposition of runway 14/32.

Living close to a major city has it's assets and liabilities. Logan Airport is both and recently has become more liability for the residents of Hull.

I do not mind planes flying overhead – up, up high in the sky. But they are getting lower, skimming rooftops... a slight exaggeration... but it sounds like it. 286.1

Massport claims it does not have control over planes that veer off flight paths or fly too low, therefore, the thought of more planes over Hull that no one seems to be able to control is very upsetting. If they cannot alleviate the present impact, how does Massport claim this new runway will not cause us more problems?

There are so many concerns such as the high percentage of VOC - Volatile Organic Compounds, which we understand already surpass State one-hour standards at times. The traffic impact is already sending many travelers to Green even though we have some good options with the water transit. 286.2 286.3

Massport claims this runway would be for smaller aircraft – why not use other airports for that? Pease wants more business, as it is. Spread the burden out rather than hitting the same communities even harder. 286.4

I am not sure of the proper term, but I know there

is a "beacon" at the Coast Guard Station is Hull. It used to be at Castle Island. A pilot friend said that even moving that to Peddocks could help alleviate part of the problem. 286.5

Massport admits it has problems with terminal space, ticketing, baggage handling. At some point, it would seem there has to be a limit to how many passengers and planes Logan can handle. They should concentrate on how to provide quality services instead of building another runway which they call a short-term remedy. They should be planning how to decrease air traffic that they cannot handle, with peak pricing and routing to other airports. There's only so big they can get. I do not believe they are planning well for future increases, atleast they have not communicated that. 286.6 286.7

I know Massport needs to deal with it's problems and it will be beneficial to everyone if it can do that without creating further problems while many of us are still trying to get some relief from present problems we think they can do more to alleviate.

Please, do not let them further damage the quality of life in Hull.

Sincerely,

Roberta Ridolfi

286.1	Alternatives	Runway 14/32	I am writing in opposition of runway 14/32. I do not mind planes flying overhead—up high...But they are getting lower...Massport claims it does not have control over planes that veer off flight paths or fly too low, therefore, the thought of more planes over Hull That no one seems to be able to control is very upsetting.	The goals of the Airside Project are to reduce delay, increase the airport's efficiency, and improve airfield safety in an environmentally responsible manner. The construction of unidirectional Runway 14/32 would prevent the significant drop in airfield capacity that now occurs during northwest wind conditions. The runway would not increase Logan Airport's normal operating capacity of approximately 120 operations per hour which is available nearly 80 percent of the year, but rather would allow this capacity to be maintained more consistently. The Supplemental DEIS/FEIR projects that the Preferred Alternative would promote runway use in a manner that is more consistent with annual PRAS goals, and Hull is affected by the use of Runway 33/32 arrivals. The total number of aircraft arriving to the northwest does increase with construction of the runway, but this is due to the PRAS goals more than any other factor. Since the Runway 33 arrivals that impact Hull approach primarily over water, and since Hull is further from the airport than those communities impacted by arrivals to Runway 15L/R, 4L/R, or 22L/R, the PRAS goals call for 42 percent of the equivalent arrivals to operate in this direction. Runway 33 arrivals accounted for approximately 27 percent of the equivalent arrivals in 1998, and since Logan Airport has a limited capacity in this direction, the northwest configuration has been underutilized as demand has increased over the years. Construction of the runway allows better achievement of the agreed-upon PRAS goals, but even with Runway 14/32, the equivalent arrivals in the Runway 33/32 direction never reach the goal of 42 percent under any fleet scenario or alternative. Operations in the vicinity of Hull increase with the Preferred Alternative primarily due to aircraft landing to the northwest, either on new Runway 32 or because of greater use of Runway 33L. However, the noise exposure levels resulting from these increased operations remains several decibels below 60 DNL as indicated by the specific point analysis at Site 26 in Tables 6.2-8, 6.2-9, 6.2-22, and E-1 of the Supplemental DEIS/FEIR. These levels are nearly 20 dB below the highest exposure in Winthrop and 15 dB below the exposure in parts of East Boston and Revere, which the new runway would help to improve.
286.2	Air Quality	NAAQS	...the high percentage of VOC - Volatile Organic Compounds... already surpass state one-hour standards at times.	There is no state or federal standard for VOCs for any averaging time.
286.3	Ground Transportation	Access to Logan	The traffic impact is already sending many travelers to Green even though we have some good options with the water transit.	Comment noted.

Code	Topic 1	Topic 2	Comment	Response
286.4	Regional Transportation	Regional Airports	...why not use other airports for [smaller aircraft]?	There are two categories of small plane activity at Logan Airport. One category is general aviation activity which consists of private, business, and air-taxi operations. Hanscom Field effectively serves as a general aviation reliever airport to Logan Airport, accommodating 183,000 general aviation operations compared to 32,000 general aviation operations at Logan Airport. The second category consists of scheduled commercial operations by regional airlines with non-jet, commuter aircraft. In 1998, there were over 200,000 regional airline commuter operations at Logan Airport. However, Massport plays no role in the decisions of these private airlines and is prohibited by federal statutes to regulate the air service routes or service levels of the airlines. Regional airlines are unlikely to move a significant number of these flights to other airports, since these airlines are either owned by larger airlines or have marketing agreements with the larger airlines which allow regional airline passengers traveling to Logan Airport to connect to flights operated by the larger airlines. Approximately 50 percent of passengers on regional airline flights connect to other flights at Logan Airport.
286.5	Alternatives	Other Non-Construction Alternatives	...but I know there is a "beacon" at the Coast Guard Station in Hull. It used to be at Castle Island... even moving that to Peddocks could help alleviate part of the problem.	Unable to discern the commentors concern.
286.6	Alternatives	Runway 14/32	Massport...has problems with terminal space, ticketing, baggage handling...there has to be a limit to how many passengers and planes Logan can handle. They should concentrate on how to provide quality services instead of building another runway which they call a short-term remedy.	The Airside analysis evaluates delays related to inefficiencies of the airfield and does not include delays related to aircraft waiting to access gates or outmoded terminals and terminal facilities. Massport and individual airlines are currently undertaking redevelopment of the landside portion of the airport *(i.e.*, terminals, roadways, etc.). These projects are also required to undergo environmental review. For Terminal A, Delta Air Lines received environmental approval for its proposed terminal replacement project in late 1999. *Logan Airport's 1999 ESPR* (formerly GEIR) reports on cumulative impacts of Logan Airport's landside and airside operations.
286.7	Alternatives	Peak Period Pricing	[Massport] should be planning how to decrease air traffic that they cannot handle, with peak pricing and routing to other airports.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR contain an analysis of PPP as a demand management alternative at Logan Airport. The analysis indicates that PPP is an effective option when airlines schedule beyond the normal hourly operating capacity of the airport, and provides an assessment of the extent of benefits form PPP under such circumstances. Additional analysis of PPP is set out in Section 4.5 of this Supplemental DEIS/FEIR. Massport advocates increased use of the regional airports and high-speed rail services, in addition to construction of Runway 14/32 and the other airside improvement projects at Logan Airport, as a comprehensive plan for ensuring an efficient and balanced regional transportation system. As the analysis in Chapter 2 of this Supplemental DEIS/FEIR indicates, these off-airport alternatives are expected to reduce aircraft traffic growth pressures at Logan Airport, but they will not eliminate airside delays at Logan Airport that occur because of a third operating runway during periods of northwest winds. The Preferred Alternative, which specifically addresses this deficiency, is necessary and provides clear benefits at current aircraft traffic levels. These benefits will only increase in the future, even as developments at the regional airports and high-speed rail to New York act to reduce the rate of future growth at Logan Airport.

16 Milford St. #3
Dedham, MA 02026

April 8, 1999 LETTER 287

Dear Mr. Tingley.

We are opposed to the runway expansion at Logan Airport. There are too many flights now without adding more. The noise level will be unbearable. 287.1

It's time to find an alternative site for additional flights. This would ease the disturbances now caused to the surrounding communities in the flight path. Let's explore reducing the number of flights rather than adding to the noise and air pollution. 287.2

Sincerely,

[illegible] Russell

Secretary of Environmental Affairs
Attention: MEPA Office
Mr. Arthur Pugsley – EOEA No. 10458
100 Cambridge Street 20th floor
Boston, MA 02205

Re: **OPPOSED to Runway 14/32**

Dear Mr. Pugsley:

I am writing to express my strong opposition to Massport's proposed new runway, 14/32. My concern is that the new runway will allow more flights into and out of Logan Airport. As a resident of Hull, I already have too many airplanes flying over my house, beginning at 4:54 a.m. each day. Runway 14/32 will substantially increase the air traffic over my neighborhood. 289.1

In addition to my own personal concerns, I have other reservations regarding any efforts to increase capacity at Logan. One is the traffic on the ground. Getting to and from Logan can be a nightmare even with the new tunnel and increased water transportation. Traffic on the Expressway gets backed up in both directions by cars trying to get to the airport. This has a negative impact on the air quality in Boston. I would be interested to compare the "lost productivity" of all those who get stuck in Logan-related traffic jams to Massport's lost productivity calculations resulting from delayed flights. Adding more airport traffic will only make the current situation worse. 289.2 289.3

As a frequent user of Logan Airport, I applaud efforts to make the operation more efficient. However, increased air traffic will mean longer waits at ticket counters, baggage carrousels, and taxi lines. I would rather see Massport continue to pursue alternatives to Logan such as Worcester and, possibly, Hanscom. 289.4 289.5

Please consider the negative impact that Runway 14/32 will have in terms of noise and air pollution for all of the surrounding communities. Thank you.

Sincerely,

Lisa J. Scannell

The Preferred Alternative, and specifically unidirectional Runway 14/32, would not increase Logan Airport's normal airfield capacity of approximately 120 operations per hour. This capacity is available at Logan Airport approximately 80 percent of the time. Runway 14/32 would allow Logan Airport to maintain this capacity during periods of strong northwest winds that now require controllers to operate on only one or two runways, compared to the typical three-runway configurations used at Logan Airport. The runway will not increase Logan Airport's normal operating capacity, nor will it encourage or induce an increase in aircraft operations.
289.5	Regional Transportation	Regional Airports	I would rather see Massport continue to pursue alternatives to Logan such as Worcester and, possibly, Hanscom.	Chapter 2 of the Supplemental DEIS/FEIR provides a discussion of the specific role played by the regional transportation alternatives and steps that Massport has taken to foster use of these alternatives. Massport has long recognized and has been a proponent of options to Logan Airport. Together with the regional airports, Massport has implemented a regional strategy to enhance the use of options to Logan Airport. In the Draft EIS/EIR, Massport identified up to 7.3 million annual passengers that could be absorbed by regional alternatives that include use of T.F. Green/Providence, Manchester and Worcester Regional airports, as well as the new high-speed rail to New York. In the Supplemental DEIS/FEIR, Massport recognizes that these developments will slow Logan Airport's passenger traffic growth. Logan Airport may not achieve the 37.5 million passenger forecasts until after 2010, but rather closer to 2015, and the 45 million passenger forecasts may not be achieved until after 2020. While regional alternatives can play an important role in reducing the rate of future traffic growth at Logan Airport, they do not address Logan Airport's inability to efficiently accommodate current levels of demand during northwest wind conditions. Runway 14/32, which is designed to correct the problem with Logan Airport's layout, is necessary to correct this deficiency and provides clear benefits at current aircraft traffic levels. These benefits will only increase in the future, even as developments at the regional airports act to reduce the rate of future growth at Logan Airport.

LETTER 290

Arthur Puglsey

Franklyn and Barbara Schafer
28 Standish Avenue
P.O. Box 502
Hull, MA 02045

21 April 1999

Dear Mr. Pugsley:

We wish to register our opposition to proposed runway 14/32.

290.1

The noise level over our home, at this time, is already unbearable. We do not want it to be increased.

We seriously question the validity of an additional runway and feel the present advertising campaign being circulated, by those in favor, is very misleading with regard to the facts.

Sincerely,

Franklyn and Barbara Schafer

290.1	Alternatives	Runway 14/32	We wish to register our opposition to proposed runway 14/32. The noise level over our home, at this time, is already unbearable. We do not want it to be increased.	The Supplemental DEIS/FEIR projects that the Preferred Alternative would promote runway use in a manner that is more consistent with annual PRAS goals, and Hull is affected by the use of Runway 33/32 arrivals. The total number of aircraft arriving to the northwest does increase with construction of the runway, but this is due to the PRAS goals more than any other factor. Since the Runway 33 arrivals that impact Hull approach primarily over water, and since Hull is further from the airport than those communities impacted by arrivals to Runway 15L/R, 4L/R, or 22L/R, the PRAS goals call for 42 percent of the equivalent arrivals to operate in this direction. Runway 33 arrivals accounted for approximately 27 percent of the equivalent arrivals in 1998, and since Logan Airport has a limited capacity in this direction, the northwest configuration has been underutilized as demand has increased over the years. Construction of the runway allows better achievement of the agreed-upon PRAS goals, but even with Runway 14/32, the equivalent arrivals in the Runway 33/32 direction never reach the goal of 42 percent under any fleet scenario or alternative. Operations in the vicinity of Hull increase with the Preferred Alternative primarily due to aircraft landing to the northwest, either on new Runway 32 or because of greater use of Runway 33L. However, the noise exposure levels resulting from these increased operations remains several decibels below 60 DNL as indicated by the specific point analysis at Site 26 in Tables 6.2-8, 6.2-9, 6.2-22, and E-1 of the Supplemental DEIS/FEIR. These levels are nearly 20 dB below the highest exposure in Winthrop and 15 dB below the exposure in parts of East Boston and Revere, which the new runway would help to improve.

SEAN SHANAHAN
30 HIGHLAND AV
HULL, MA 02

LETTER 291

DEAR SIR,

291.1

I AM WRITING TO VOICE MY OPPOSITION TO THE EXPANSION OF LOGAN AIRPORT, IN THIS CASE RUNWAY 14/32, DUE TO THE INCREASE IN NOISE, TRAFFIC, POLLUTION, AND 291.2 291.3 THE DETRIMENTAL EFFECTS OF THESE UPON THE 291.4 BOSTON AND SURROUNDING COMMUNITIES QUALITIES OF LIFE.

I ATTENDED THE ANTI-RUNWAY RALLY AT THE STATE HOUSE ON MONDAY AND WAS HEARTENED BY THE UNITY SHOWN BY THE VARIOUS NEIGHBORHOODS AND THEIR ELECTED OFFICIALS. PLEASE JOIN US IN THE SEARCH FOR A MORE SUITABLE ALTERNATIVE (THINK REGIONAL) TO RUNWAY 14/32.

YOURS TRULY,

Sean E. Shanahan

291.1	Noise	Impacts	I am writing to voice my opposition to...Runway 14/32, due to the increase in noise...	The Supplemental DEIS/FEIR projects that the Preferred Alternative would promote runway use in a manner that is more consistent with annual PRAS goals, and Hull is affected by the use of Runway 33/32 arrivals. The total number of aircraft arriving to the northwest does increase with construction of the runway, but this is due to the PRAS goals more than any other factor. Since the Runway 33 arrivals that impact Hull approach primarily over water, and since Hull is further from the airport than those communities impacted by arrivals to Runway 15L/R, 4L/R, or 22L/R, the PRAS goals call for 42 percent of the equivalent arrivals to operate in this direction. Runway 33 arrivals accounted for approximately 27 percent of the equivalent arrivals in 1998, and since Logan Airport has a limited capacity in this direction, the northwest configuration has been underutilized as demand has increased over the years. Construction of the runway allows better achievement of the agreed-upon PRAS goals, but even with Runway 14/32, the equivalent arrivals in the Runway 33/32 direction never reach the goal of 42 percent under any fleet scenario or alternative. Operations in the vicinity of Hull increase with the Preferred Alternative primarily due to aircraft landing to the northwest, either on new Runway 32 or because of greater use of Runway 33L. However, the noise exposure levels resulting from these increased operations remains several decibels below 60 DNL as indicated by the specific point analysis at Site 26 in Tables 6.2-8, 6.2-9, 6.2-22, and E-1 of the Supplemental DEIS/FEIR. These levels are nearly 20 dB below the highest exposure in Winthrop and 15 dB below the exposure in parts of East Boston and Revere, which the new runway would help to improve.
291.2	Ground Transportation	Access to Logan	I am writing to voice my opposition to...Runway 14/32, due to the increase in traffic...	The Preferred Alternative, and specifically unidirectional Runway 14/32, would not increase Logan Airport's normal airfield capacity of approximately 120 operations per hour. This capacity is available at Logan Airport approximately 80 percent of the time. Runway 14/32 would allow Logan Airport to maintain this capacity during periods of strong northwest winds that now require controllers to operate on only one or two runways, compared to the typical three-runway configurations used at Logan Airport. The runway will not increase Logan Airport's normal operating capacity, nor will it encourage or induce an increase in aircraft operations.
291.3	Air Quality	Impacts	I am writing to voice my opposition to...Runway 14/32, due to the increase in pollution...	The growth in emissions over time will occur with or without the Airside Project. However, the Preferred Alternative presents a significant decrease in emissions compared to the No Action Alternative. Dispersion modeling shows no violation of the NAAQS.

Code	Topic 1	Topic 2	Comment	Response
291.4	General Opposition		I am writng to voice my opposition to...Runway 14/32 due to the... detrimental effects [the increase in noise, traffic, and pollution will have] upon the Boston and surrounding communities qualities of life.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR analyze the environmental impacts of the Airside Project, consistent with established federal and state scoping directives. Appropriate mitigation associated with the Airside Project has also been established. Massport has programs in place to reduce the environmental impacts associated with Logan Airport as a whole. These initiatives are described in the *Logan Airport ESPR* and its updates.

LETTER 292

Secretary of Environmental Affairs
Attn: MEPA Office
Mr. Arthur Pugsley - EOEA No. 10458
100 Cambridge St.
20th Floor
Boston, MA 02205

Dear Mr. Pugsley:
I am strongly opposed to Massport's proposed runway, 14/32.
When I moved here from Winthrop 10 years ago, the primary reason was to escape the constant noise from Logan.

Most Hull residents I have spoken to feel as I do. We have far more noise from the airport now, than we did just a few years ago, and it is already at a borderline intolerable level. I live and work here and it makes too many hours of my day unpleasant, unproductive and perhaps unhealthy. 292.1

I would suggest that you watch the videotape of the April 13 Hull Selectmen's meeting to get a full understanding of the issue as it affects Hull residents. If you do, you will see Massport's representative Ms. Betty Derosiers' attempt to talk her way around the direct questions of a very frustrated board of selectmen. She dodged questions about intended growth in flights. She said it was impossible to "cap" operations and could not consider changing the laws (policy's) that govern such caps. (How did they manage to do it in Washington D.C.?) She said Massport had no control over the actual flight path of pilots using Logan. Most frustrating was the totally bogus charts Massport brought. The charts showed flight paths that missed Hull on both takeoff and landing, an obvious falsehood and actually an insult to our intelligence. You will see Ms. Derosiers do a very bad job explaining away the faulty noise monitors put in place in Hull. 292.2 292.3 292.4

You will see an organization so determined to make this runway a reality that they are willing to ignore the 17 of 19 CARE communities who oppose the runway. If your office made decisions based on arrogance, this case would be closed. The operational fact is that Hull is subject to noise levels that should motivate your office to block this runway. 292.5

Thank you for your concern for the envirionment in which we live.

Yours truly,

Gerard J. Sperry

292.1	Alternatives	Runway 14/32	I am strongly opposed to Massport's proposed runway, 14/32. We have far more noise from the airport now, than we did just a few years ago, and it is already at a borderline intolerable level.	The Supplemental DEIS/FEIR projects that the Preferred Alternative would promote runway use in a manner that is more consistent with annual PRAS goals, and Hull is affected by the use of Runway 33/32 arrivals. The total number of aircraft arriving to the northwest does increase with construction of the runway, but this is due to the PRAS goals more than any other factor. Since the Runway 33 arrivals that impact Hull approach primarily over water, and since Hull is further from the airport than those communities impacted by arrivals to Runway 15L/R, 4L/R, or 22L/R, the PRAS goals call for 42 percent of the equivalent arrivals to operate in this direction. Runway 33 arrivals accounted for approximately 27 percent of the equivalent arrivals in 1998, and since Logan Airport has a limited capacity in this direction, the northwest configuration has been underutilized as demand has increased over the years. Construction of the runway allows better achievement of the agreed-upon PRAS goals, but even with Runway 14/32, the equivalent arrivals in the Runway 33/32 direction never reach the goal of 42 percent under any fleet scenario or alternative. Operations in the vicinity of Hull increase with the Preferred Alternative primarily due to aircraft landing to the northwest, either on new Runway 32 or because of greater use of Runway 33L. However, the noise exposure levels resulting from these increased operations remains several decibels below 60 DNL as indicated by the specific point analysis at Site 26 in Tables 6.2-8, 6.2-9, 6.2-22, and E-1 of the Supplemental DEIS/FEIR. These levels are nearly 20 dB below the highest exposure in Winthrop and 15 dB below the exposure in parts of East Boston and Revere, which the new runway would help to improve.
292.2	Alternatives	Other Non-Construction Alternatives	Why is it not possible to cap growth in flights as was done in Washington, D.C.?	The Airside Project will not change Logan Airport's airfield capacity of approximately 120 aircraft operations per hour. Regarding caps on airport operations, federal constitutional provisions (preemption, commerce clauses, equal protection), federal aviation statutes and regulations, and contractual provisions related to covenants in connection with the Federal Airport Improvement Program grants which Massport receives, restrict Massport's ability to control the number of aircraft operations at Logan Airport. Massport has undertaken a comprehensive mitigation program, such as Logan Airport Noise Rules, for those areas that fall within its powers as proprietor of Logan Airport, which are not preempted under federal law.
292.3	Noise	Studies	Massport's charts incorrectly show flight paths that miss Hull on takeoff and landing.	Graphics have been updated, supplemented and corrected.
292.4	Noise	Runway Use	Noise monitors in Hull were faulty.	Massport disagrees.
292.5	Environmental Review Process	Public Process	Massport is ignoring 17 of the 19 CARE communities opposing the runway.	Comment noted.

293.2	Alternatives	Runway 14/32	Runway 14/32 will substantially increase the air traffic over my neighborhood. This will increase noise and air pollution for our entire town.	Refer to response to Comment 293.1.

Code	Topic 1	Topic 2	Comment	Response
293.3	Regional Transportation	Regional Airports	Please consider alternatives to Logan expansion such as improved access to Worcester Airport and other regional airport solutions.	Since 1995, Massport has worked closely with the City of Worcester to aggressively market the Worcester Regional Airport to airlines. Massport increased its involvement with Worcester Regional Airport by assuming operational responsibility of the airport on January 15, 2000. Since January 2000 Massport has attracted three new airlines to Worcester Regional Airport. Delta Connection began serving Worcester Regional Airport with two daily nonstop roundtrip flights on regional jet aircraft to Atlanta on February 1, 2000 and will be increasing its service to three daily flights in April 2001. On July 6, 2000, American Eagle began service to New York JFK Airport with three daily nonstop roundtrip flights on turboprop aircraft. In February 2001, PanAm began daily scheduled service from Worcester to Orlando International Airport. Massport is in ongoing discussions with other carriers regarding potential new services at Worcester Regional Airport. In addition to the Worcester Regional Airport, Massport has pursued a variety of initiatives to promote the use of other regional airports and travel modes with the goal of relieving traffic growth pressures at Logan Airport. For example, in November 1999, Massport and Governor Cellucci co-sponsored a Regional Transportation Summit of the New England Governors and transportation officials. The Summit focused on joint marketing among the New England commercial service airports and the joint promotion of rail and road initiatives that will foster an efficient and balanced regional transportation system. A second summit was held in Rhode Island in December 2000. Refer to Chapter 2 of the Supplemental DEIS/FEIR for a comprehensive discussion of Massport's regional transportation planning initiatives. Massport disagrees that its record in diverting traffic to other airports is unsuccessful. Since 1996 eight out of ten new passengers in New England were directed to regional airports, which include T.F. Green/Providence, Worcester Regional, and Manchester airports. In 1999, Massport estimates that regional airports attracted 2.4 million passengers, that would have otherwise used Logan Airport. Massport advocates increased use of the regional airports and high-speed rail services, in addition to construction of Runway 14/32 and the other airside improvement projects at Logan Airport, as a comprehensive plan for ensuring an efficient and balanced regional transportation system. As the analysis in Chapter 2 of this Supplemental DEIS/FEIR indicates, these off-airport alternatives are expected to reduce aircraft traffic growth pressures at Logan Airport, but they will not eliminate airside delays at Logan Airport that occur because of a third operating runway during periods of northwest winds. The Preferred Alternative, which specifically addresses this deficiency, is necessary and provides clear benefits at current aircraft traffic levels. These benefits will only increase in the future, even as developments at the regional airports and high-speed rail to New York act to reduce the rate of future growth at Logan Airport.

Re: Proposed Runway 14/32

Dear Mr. Pugsley:

We are writing to express our strong opposition to proposed Runway 14/32 at Logan Airport. As residents of Hull, we are somewhat accustomed to aircraft traffic and its associated noise. However, the recent proposal to add a runway 14/32 to Logan and increase the air traffic over our community and other communities will clearly have a substantial adverse impact on the citizens of the affected communities including the diminished quality of life and the diminution of property values. We are not alone in our concern. All of our friends and neighbors have felt the effects from the aircraft noise. 297.1

Depending on weather conditions and on certain days, there is a seemingly unending parade of aircraft over the Hull Village area of town where we live. Although the hours for such flights were to be limited to "waking" hours, we have been awakened after 11:00 p.m. and before 6:00 a.m. countless times. In fact, we have taken to sleeping with a fan on in our bedroom to mask the sound of planes. On Sunday afternoons in particular, the aircraft noise often prevents the use of our deck and the enjoyment of our yard due to the frequent and repeated roar and whine of airplanes approaching and departing Logan. To give you some perspective, most large commercial aircraft are low enough for us to clearly see the aircraft landing gear being deployed or retracted. We would agree to have noise measuring instruments in or on our home so the real effect could be recorded for analysis.

As you can imagine, this barrage of noise is extremely disruptive. The proposed runway will more than double the number of flights over our home and surrounding neighborhoods and communities. The effect of this traffic will turn our home, our town and the affected communities into a noise ridden string of flight paths. We ask you to imagine sports fields where childrens' soccer games are interrupted because a referee's whistle can't be heard over the din of planes, or a day at the beach punctuated not by waves crashing or the cry of sea gulls but by an endless roar of a line of aircraft across the horizon. Please consider this community and other similarly situated communities in performing the MEPA review process. 297.2

Apart from our personal feelings and the personal effects described above, we are equally concerned about the approval process Massport has embarked on. Massport has sought to abrogate its agreements with affected communities and to overturn a court order to undertake what appears to be a flawed and short-sighted plan of disruptive expansion. There have been very few real opportunities to be heard on a local and/or a regional level. Information disseminated by Massport has been short on objective analysis and/or inconsistent with recognized methodologies. 297.3 297.4

What's even more shocking about this approach is that it is supported to large extent by public funds.

We and our neighbors recognize that Boston, as a major city and a tourist and business destination, requires a strong transportation infrastructure. However, studies have shown that the projected increase in air traffic will outstrip Logan's capacity in the relatively near future and that the proposed new runway is a costly -- on both fiscal and societal levels -- and poorly-devised plan. Moreover, by increasing air traffic into Boston Massport runs the very real risk of diminishing the value of the Boston area as a destination. Its harbor and historic neighborhoods will be materially affected by the increase in flights and resulting noise. We work in Boston and frequently commute on the Hingham commuter boat and find noise from the aircraft to be a tremendous distraction to the beauty of Boston and the Harbor Islands. Increased noise and pollution will diminish Boston's lure as a tourist or convention location if its downtown hotels and tourist attractions are plagued by noise. As frequent travelers, we find that most major U.S. cities have at least two significant commercial airports in the near vicinity, one of which is located outside of the congestion of the city. It strikes us that Hanscom Airport, with its almost immediate accessibility to Route 128 and other major arteries, could serve this role and should be reviewed. 297.5 297.6 297.7

We urge you to reconsider the expansion of Logan and consider our community and other Boston area communities. We do not make this appeal as a NIMBY argument. Rather, we ask that the very real costs and effects of increased air traffic into and out of the Boston area be measured and evaluated before the decision is made, and that such costs and effects be justly apportioned throughout the metropolitan Boston region and not simply on Boston's neighborhoods and the surrounding towns and communities.

Sincerely yours,

Robert M. Carney and Wanda C. Willard

Letter 297

Code	Topic 1	Topic 2	Comment	Response
297.1	Alternatives	Runway 14/32	We are writing to express our strong opposition to proposed Runway 14/32 at Logan Airport…the recent proposal to add a runway 14/32 to Logan and increase the air traffic…will clearly …[diminish] quality of life and…property values	The Supplemental DEIS/FEIR projects that the Preferred Alternative would promote runway use in a manner that is more consistent with annual PRAS goals, and Hull is affected by the use of Runway 33/32 arrivals. The total number of aircraft arriving to the northwest does increase with construction of the runway, but this is due to the PRAS goals more than any other factor. Since the Runway 33 arrivals that impact Hull approach primarily over water, and since Hull is further from the airport than those communities impacted by arrivals to Runway 15L/R, 4L/R, or 22L/R, the PRAS goals call for 42 percent of the equivalent arrivals to operate in this direction. Runway 33 arrivals accounted for approximately 27 percent of the equivalent arrivals in 1998, and since Logan Airport has a limited capacity in this direction, the northwest configuration has been underutilized as demand has increased over the years. Construction of the runway allows better achievement of the agreed-upon PRAS goals, but even with Runway 14/32, the equivalent arrivals in the Runway 33/32 direction never reach the goal of 42 percent under any fleet scenario or alternative. Operations in the vicinity of Hull increase with the Preferred Alternative primarily due to aircraft landing to the northwest, either on new Runway 32 or because of greater use of Runway 33L. However, the noise exposure levels resulting from these increased operations remains several decibels below 60 DNL as indicated by the specific point analysis at Site 26 in Tables 6.2-8, 6.2-9, 6.2-22, and E-1 of the Supplemental DEIS/FEIR. These levels are nearly 20 dB below the highest exposure in Winthrop and 15 dB below the exposure in parts of East Boston and Revere, which the new runway would help to improve.
297.2	Alternatives	Runway 14/32	…we are… concerned about the approval process Massport has embarked on. Massport has sought to abrogate its agreements with affected communities and to overturn a court order to undertake…a flawed and short-sighted plan of disruptive expansion.	In January 2000, in response to the FAA's review of the Draft EIS, the FAA called for preparation of a Supplemental Draft EIS to address specific issues identified by the FAA following input from a SDEIS Panel consisting of six persons. At the FAA's direction, three SDEIS Panel members were appointed by the Governor of the Commonwealth of Massachusetts and three were appointed by the Mayor of the City of Boston. Under the direction of the New England Region FAA, the SDEIS Panel convened in March of 2000 and then met at least monthly with a final meeting in December of 2000. A total of 12 meetings were held. To provide the appropriate background, the SDEIS Panel was presented with an Interim Supplemental Draft EIS, the Draft EIS/EIR, answers to key letters written by members of the public, concerned agencies and public officials responding to the Draft EIS/EIR, and a series of 15 visual and written presentations from the Project's technical consulting team and other independent industry experts. The Secretary of Environmental Affairs found that "…the Draft Environmental Impact Report (DEIR) submitted on this project adequately and properly complies with the Massachusetts Environmental Policy Act…". Refer to the Certificate of the Secretary of Environmental Affairs on the DEIR, dated May 7, 1999.

Code	Topic 1	Topic 2	Comment	Response
297.3	Environmental Review Process	Public Process	There have been very few real opportunities to be heard on a local and/or a regional level.	There was an extensive public participation and review process during the preparation of the Draft EIS/EIR. Public comments were received on the ENF after it was filed during the summer of 1995. In the fall of 1995, several public scoping sessions were held to provide community input to the subsequent state and federal scopes for the project. To assure that the Airside analysis was conducted with awareness and input from all concerned parties, the Massport Board established the Airside Review Committee (ARC), which consists of the Community Advisory Committee (with representatives from 24 communities surrounding Logan Airport), and 11 businesses and industry organizations. Massport also funded independent consultants for the CAC to provide them with the capacity to professionally assess the analysis and conclusions of the Airside Study. Between 1995 and 1999, Massport held 16 meetings with the ARC, an additional 15 meetings with just the CAC, and several meetings with the CAC consultants. In addition, Massport made 29 presentations to elected officials, most of whom represent Logan Airport's neighboring communities, and Massport held 45 meetings with community and business leaders, reaching an audience of more than 3,000 people. During the public comment period on the Draft EIS/EIR, the FAA held two public hearings. In January 2000, in response to the FAA's review of the Draft EIS, the FAA called for preparation of a Supplemental Draft EIS to address specific issues identified by the FAA following input from a SDEIS Panel consisting of six persons. At the FAA's direction, three SDEIS Panel members were appointed by the Governor of the Commonwealth of Massachusetts and three were appointed by the Mayor of the City of Boston. Under the direction of the New England Region FAA, the SDEIS Panel convened in March of 2000 and then met at least monthly with a final meeting in December of 2000. A total of 12 meetings were held. To provide the appropriate background, the SDEIS Panel was presented with an Interim Supplemental Draft EIS, the Draft EIS/EIR, answers to key letters written by members of the public, concerned agencies and public officials responding to the Draft EIS/EIR, and a series of 15 visual and written presentations from the Project's technical consulting team and other independent industry experts.

Code	Topic 1	Topic 2	Comment	Response
297.4	Environmental Review Process	Public Process	Information disseminated by Massport has been short on objective analysis and/or inconsistent with recognized methodologies.	The Secretary of Environmental Affairs found that "...the Draft Environmental Impact Report (DEIR) submitted on this project adequately and properly complies with the Massachusetts Environmental Policy Act...". Refer to the Certificate of the Secretary of Environmental Affairs on the DEIR, dated May 7, 1999. In January 2000, in response to the FAA's review of the Draft EIS, the FAA called for preparation of a Supplemental Draft EIS to address specific issues identified by the FAA following input from a SDEIS Panel consisting of six persons. At the FAA's direction, three SDEIS Panel members were appointed by the Governor of the Commonwealth of Massachusetts and three were appointed by the Mayor of the City of Boston. Under the direction of the New England Region FAA, the SDEIS Panel convened in March of 2000 and then met at least monthly with a final meeting in December of 2000. A total of 12 meetings were held. To provide the appropriate background, the SDEIS Panel was presented with an Interim Supplemental Draft EIS, the Draft EIS/EIR, answers to key letters written by members of the public, concerned agencies and public officials responding to the Draft EIS/EIR, and a series of 15 visual and written presentations from the Project's technical consulting team and other independent industry experts.
297.5	Alternatives	Runway 14/32	...studies have shown that the projected increase in air traffic will outstrip Logan's capacity in the relatively near future and that the proposed new runway is a costly--on both fiscal and societal levels--and poorly-devised plan.	Based on simulation modeling, Logan Airport experienced 120,000 hours of runway-related delays in 1998. If no actions are taken, runway-related delays are forecast to grow as high as 333,000 hours under a 37.5M High Fleet scenario. The Preferred Alternative produces immediate and long-term benefits by lowering runway delays by 38,000 hours if it had been in place in 1998, and by as much as 94,000 hours in the future 37.5M High Fleet scenario. Because of the impact of the regional alternatives, the 37.5M High Fleet scenario is not expected to be achieved until 2015. The sooner airside efficiencies are implemented; the more benefits will accrue over time. Section 4.6 of the Supplemental DEIS/FEIR shows that delay reduction benefits increase over time as traffic levels increase.
297.6	Open Space/ Parkland	Impacts	...by increasing air traffic into Boston Massport runs the very real risk of diminishing the value of the Boston area as a destination. Its harbor and historic neighborhoods will be materially affected by the increase in flights and resulting noise.	The Preferred Alternative, and specifically unidirectional Runway 14/32, would not increase Logan Airport's normal airfield capacity of approximately 120 operations per hour. This capacity is available at Logan Airport approximately 80 percent of the time. Runway 14/32 would allow Logan Airport to maintain this capacity during periods of strong northwest winds that now require controllers to operate on only one or two runways, compared to the typical three-runway configurations used at Logan Airport. The runway will not increase Logan Airport's normal operating capacity, nor will it encourage or induce an increase in aircraft operations.

297.7	Regional Transportation	Regional Airports	...Hanscom Airport, with its almost immediate accessibility to Route 128 and other major arteries, could serve this role [of alternate significant commercial airport in the vicinity] and should be reviewed.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR, specifically considered the role of Hanscom Field in the analysis of regional alternatives. Hanscom Field, which serves as a general aviation reliever airport to Logan Airport, already accommodates a significant number of aircraft operations (183,000 operations in 1998). The Hanscom Field activity includes private, business, charter, and air taxi operations that might otherwise use Logan Airport. Since the Airside Project Draft EIS/EIR was filed, Shuttle America, a newly founded airline, began commercial scheduled operations at Hanscom Field, offering limited turboprop services to short-haul regional markets – Trenton, Buffalo, Hartford (discontinued), Wilmington, Delaware (discontinued), and Greensboro. Shuttle America is also conducting operations between Hanscom and New York LaGuardia Airport. While Massport supports commercial service at Hanscom Field consistent with its established limits (60 seat regulation), Massport believes that Hanscom Field will maintain its role as a major general aviation reliever, and that its geographic proximity to Logan, Worcester Regional and Manchester airports will prevent its development as a significant commercial airport. Additionally, commuter airlines serving Logan Airport are unlikely to move a significant number of flights from Logan Airport to Hanscom Field, since approximately 50 percent of passengers on Logan Airport's commuter flights connect to other Logan Airport flights and a significant number of passengers are travelling to Boston. However, any new commercial service initiatives proposed for Hanscom Field shall be reviewed for consistency with the *Hanscom GEIR* (HGEIR) and its Annual Updates, and shall be considered by the Hanscom Area Town Selectmen (HATS). Refer to Section 2.6 of the Supplemental DEIS/FEIR for a discussion of Hanscom Field.

Dear MR Pugsley

LETTER 298

I am a long time resident of Hull and enough is enough! It is Sunday 6:00 A.M. and the planes are flying low and loud, Polluting the air and the ears.

Instead of building a new runway, wouldn't it be more economically and environmentally sound to 1: have smaller planes pay higher fees during Peak hours to help ease airplane traffic and 2: have shuttle buses that are centrally located to take people to Green R.I. and Manchester N.H. airports More and more people want to use these airports why not make it easier for people to do so?

298.1

298.2

Sincerely

Letter 298
Unknown Commentor (Illegible Signature)

Code	Topic 1	Topic 2	Comment	Response
298.1	Alternatives	Peak Period Pricing	Instead of building a new runway, wouldn't it be more economically and environmentally sound to have smaller planes pay higher fees during peak hours to help ease airplane traffic[?]	Section 4.5 of the Supplemental DEIS/FEIR provides an updated discussion of PPP at Logan Airport and an analysis of the implications of an illustrative conceptual small community exemption program. PPP was included among the Airside Project alternatives to address delays caused by over-scheduling. The potential impact of PPP on the fleet mix at Logan Airport is discussed in Section 4.5.2 of the Supplemental DEIS/FEIR. Section 4.5.3 of the Supplemental DEIS/FEIR provides an analysis of a PPP Exemption program.
298.2	Regional Transportation	Regional Airports	Instead of building a new runway, wouldn't it be more economically and environmentally sound to have shuttle buses that are centrally located to take people to Green RI and Manchester NH airports?	Logan Airport is part of a regional system of airports that includes T.F. Green/Providence, Worcester Regional and Manchester. Massport has long recognized that service development and increased passenger traffic at these airports are an important part of the region's long-term strategy to accommodate passenger and activity growth. Massport has actively encouraged the development of regional airports and full use of other options, including high-speed rail to Logan Airport's largest market, New York. Regional service was examined in Chapter 2 of the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR. This analysis supports the conclusion greater use of the regional airports will provide passengers within the service area of such airports with a viable alternative to Logan Airport. Since demand within Logan Airport's primary service area will remain strong, the improvements at other regional airports will not eliminate the need for airside projects at Logan Airport.

LETTER 299

We would like to register our support for the construction of runways 14-32 at Logan International Airport.

In doing so we would like to state a few facts on the matter of the airport. Reaction to headlines bearing misinformation or half-truths about this construction project has pushed many political entities to ignore a basic need of our International Airport. Our airport needs a second runway when the winds favor the northwest. Flight safety and delay reduction cry out for it. 299.1

Increased noise cannot possibly be used as an excuse. This unidirectional runway is approached over water. This fact alone should have residents enthused. Instead of having to stack up planes during these wind conditions for landing on the single existing runway, the tower will be able to space and land the same number of airplanes in much less time. There are now delays which mean late evening arrivals that would not have to happen. 299.2 299.3

We are natives of Boston and have seen many changes to our great city. We understand that progress needs to be studied and evaluated. We cannot see, however, how the construction of this runway can possibly be labeled as a means of increasing the flow of traffic into Logan. The facts are that our airport, streetside and airside are congested. There is limited terminal space and the parking lots cannot handle more cars. 299.4

The purpose of this runway is simple. There is a demand during all wind conditions and it needs to be met. Please ignore the headlines and stick to the facts.

Please support this construction project.

Thank you,

Robert Strojny and Katherine Strojny

LETTER 300

April 20, 1999

MEPA
100 Cambridge Street, 20th Floor
Boston MA 02202

Dear Arthur Pugsley:

Please include the following letter as written testimony AGAINST the Logan Airport Runway Extension.

I purchased property and moved to Jamaica Plain last November. The purchase was preceded by careful research to choose a home that would afford a high quality of life. I thought I had checked out everything necessary to support this quality of life.

Within ONE HOUR of moving to this property, I was devastated. The sound of airplanes was deafening. Planes begin flying at 6 AM EVERY DAY OF THE WEEK. This noise severely impacts our home. The ongoing damage to hearing and nervous systems is causing serious medical problems. 300.1

I invite anyone to come to my home at 6 AM any day of the week and listen to the thunderous sound at the rate of one plane avery 60 seconds.

The Runway extension is shortsighted. The only real solution is a new airport. In lieu of this, all citizens of MASSACHUSETTS should share the burden via a REGIONAL solution.

Thank you,

Cheryl Balukonis 43 Boynton Street 3L Jamaica Plain
617 983-9147

Letter 300

300.1	Regional Transportation	Regional Airports	Please include the following letter as written testimony AGAINST the Logan Airport Runway Extension...The only real solution is a new airport. In lieu of this, all citizens of Massachusetts should share the burden via a REGIONAL solution.	A second major airport is not a solution to the current delay and congestion problems at Logan Airport. The Proposed Project to reduce delay and enhance safety at Logan Airport must be implemented in the near term to address current and future operating conditions. Even if a second major airport were to be pursued, the planning period for site selection and environmental review would require ten to 15 years, in addition to a multi-year construction period. Rather, Logan Airport is part of a regional system of airports that includes the T.F. Green/Providence, the Manchester, and the Worcester Regional airports. Service development and increased passenger traffic at these airports are an important part of the region's long-term strategy to accommodate passenger and activity growth. Greater use of the regional airports will provide passengers within the service area of such airports with a viable alternative to Logan Airport. Since demand within Logan Airport's primary service area will remain strong, the improvements at other regional airports will not eliminate the need for airside projects at Logan Airport.

COMMENT PROCEDURE for: Draft Logan Airside Improvements (a.k.a. Runway 14/32) **EOEA #10458**

All comments on EIRs (environmental impact report) must refer to the EOEA file number. There may be other identifying numbers. but the EOEA file number is the one which must be used.

Comments not referring to the EOEA file number may not be considered.

100 Cambridge Street - 20th Floor
Boston. MA 02202

Failure to address mail in this manner may result in delay of action on comments or no action on comments at all.

Dear Mr. Durand,

My comments to the EIR-Logan Airside Improvements Plan EOEA #10458 are as follows:

The plan does not take into consideration the cumulative impact of the ground and air congestion. The noise from the airplanes alone is overwhelming. When you add the ground transportation problems, it is clear that proposed Runway is unworkable. 301.1

Name Daniel L. Barnett
Address 16 Alveston St

Dear Mr. Durand,

My comments to the EIR-Logan Airside Improvements Plan EOEA #10458 are as follows:

(1.) Massport has left out reasonable alternatives to Logan's plan to add more runway area. 302.1

(2) Massport's plan contains NO 2010 noise contours. 302.2

(3) The 3 year deadline to file a change of project notice (April 8/98, Massport should not be allowed to file now. 302.3

(4) The EIS uses outdated data from 1993 in its base case information. 302.4

(5) While Massport calculates a cost per delay hour in the air it refuses to attach a cost to problems caused by the negative products of its current plan - traffic, pollution, noise, and so on. 302.5

Code	Topic 1	Topic 2	Comment	Response
302.1	Alternatives	Other Non-Construction Alternatives	Massport has left out reasonable alternatives to Logan's plan to add more runway area.	The alternative analysis conforms to FAA and MEPA scoping directives. The impact of the regional alternatives has been addressed through the study of a range of forecast activity levels. Refer to Chapter 2 of the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR for a comprehensive discussion of regional alternatives. Massport advocates increased use of the regional airports and high-speed rail services, in addition to construction of Runway 14/32 and the other airside improvement projects at Logan Airport, as a comprehensive plan for ensuring an efficient and balanced regional transportation system. As the analysis in Chapter 2 of this Supplemental DEIS/FEIR indicates, these off-airport alternatives are expected to reduce aircraft traffic growth pressures at Logan Airport, but they will not eliminate airside delays at Logan Airport that occur because of a third operating runway during periods of northwest winds. The Preferred Alternative, which specifically addresses this deficiency, is necessary and provides clear benefits at current aircraft traffic levels. These benefits will only increase in the future, even as developments at the regional airports and high-speed rail to New York act to reduce the rate of future growth at Logan Airport.
302.2	Noise	Model	Massport's plan contains no 2010 noise contour.	Noise contours have been produced for the 29M Low, 37.5M High, and 2015 High Regional Jet Fleets. These various projections are considered to represent the range of operations and their impacts that are likely to occur over the next ten years.
302.3	Environmental Review Process	MEPA	The 3-year deadline to file a change or project notice expired 8/98. Massport should not be allowed to file now.	The Secretary of Environmental Affairs found that "...the Draft Environmental Impact Report (DEIR) submitted on this project adequately and properly complies with the Massachusetts Environmental Policy Act...". Refer to the Certificate of the Secretary of Environmental Affairs on the DEIR, dated May 7, 1999.

Code	Topic 1	Topic 2	Comment	Response
302.4	Analysis Assumptions/ Methodologies	Base Year	This EIS uses outdated data from 1993 in its base case information.	The Supplemental DEIS/FEIR provides updated information for 1998—the latest year for which actual Logan Airport data are available. 1993 was adopted as the base year when the Airside Improvement studies commenced in 1994. The primary function of the Base Year analysis is to calibrate the airfield operation models and environmental impact models. The benefits and impacts of the action alternatives (Alternatives 1, 1A, 2 and 3) are assessed by comparing these not with the base year, but with Alternative 4, the No-Action Alternative. The planning scenarios for 37.5 and 45 million passengers represent a range of future activity at Logan Airport expected in the 2010 to 2020 time frame. Refer to Section 4.4 of the Supplemental DEIS/FEIR for a discussion on the estimation and modeling of flight delays. It includes a description of FAA and U.S. DOT delay measures and their limitations, an explanation of computer models for estimating flight delays, and historical data on delays at Logan Airport and other major United States airports. The methodology used for the Airside Project includes the effects of constraints at Logan Airport, and produces lower delay estimates than FAA modeling. The FAA approved all the models, which have been validated in previously published studies of Logan Airport. The FAA Technical Center was responsible for the capacity and delay results in the 1992 FAA Capacity Enhancement Report for Logan Airport that concluded the need for Runway 14/32, reduced minimums and taxiway improvements. The Technical Center simulated Logan Airport airfield operations with the RDSIM model and estimated that when activity reached 504,000 annual operations, total delay would exceed 260,000 hours per year. The Airside Project Draft EIS/EIR forecasts delays to increase to 157,500 hours per year when annual operations reach 510,000 with the 29M Low Fleet scenario. The Supplemental DEIS/FEIR compares the FAA Technical Center delay estimates in 1992 with those of the Logan Airside Project estimates. The FAA has concluded that the Airside delays represent "a plausible and conservative estimate...." The FAA consistently rates Logan Airport as one of the most delay prone airports in the United States Logan Airport's estimated annual delay hours are over five times the FAA's 20,000-hour threshold for a severely delayed airport.
302.5	Purpose and Need	Delay	While Massport calculates a cost per delay hour in the air it refuses to attach a cost to problems caused by the negative products of its current plan-traffic, pollution, noise and so on.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR documents comply with all applicable NEPA and MEPA requirements. A cost benefit analysis is not required by federal or state law and would not provide appropriate context. Cost information mentioned in the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR is intended to provide analytic context.

LETTER 303

April 21, 1999

Robert A. Durand, Secretary
Executive Office of Enviromental Affairs
100 Cambridge Street - Room 2000
Boston, MA 02202

Attention: MEPA Office

Dear Secretary Durand:

I am writing to oppose Massport's plan to construct Runway 14/32 at Logan Airport as I believe this proposal will be harmful to the Greater Boston area in the following ways: 303.1

Building Runway 14/32 will allow Massport to operate Logan Airport at a greater capacity than at present. This expansion of air traffic expands air pollution in communities already suffering the highest rates of asthma in The Commonwealth. Airplanes are not regulated for pollution control; more flights means more pollution.

Increased vehicles traveling to and from Logan will, IN EVERY INSTANCE travel through these same communities. Many of these vehicles will be deisel which are also not regulated and which release a large amount of particulate matter. 303.2

The economic arguments advanced for this expansion are fallacious. They rest, in part, on the assumption that a new Convention Center served by an expanded airport, luxury hotel and restaurant industry will create a regional economic boom with an expansion of jobs.

The truth is that the increase in noise and traffic will devastate many small and medium-sized businesses such as local restaurants, nightclubs and offices, theatres, arts and music venues, the film/location industry. aspects of the tourist industry which will no longer stay in local bed-and-breakfasts and the booming real estate industry. These industries are part of our economic strenght. When our regional economy fell apart in the 1950's and 1960's having an airport at Logan was no help because our economy had been based on a few, large industries that relocated. Diversification, not airplanes, resurrected our economy. 303.3

Airport expansion will create jobs but these jobs are likely to be low-wage, no benefits, dead-end jobs such as chambermaid, airport security, dishwasher etc. which don't create prosperity for anyone other than large banks, large developers and construction companies, large hotel and restaurant owners. These industries pump money OUT of the Boston area because most of the owners and/or corporate headquarters are not located in the Greater Boston area. 303.4

Finally, I am outraged that an agency of state government would continue to forget it's purpose: to serve the best interests of ALL the people of this state. The pitting of City against Suburb, the rich against the less rich may be politics but it is not governance. This proposal doesn't even

303.5

serve the majority of Logan Airport users; people who live between Routes 128 and Route 495. Expanded airport traffic will travel over already saturated roads before reaching the Central Artery and the Third Harbor Tunnel, further delaying travelers.

I hope you consider these and other reasons sufficient to reject Massport's MEPA EIS on the proposal to build Runway 14/32. Many alternative sugestions have been offered. I ask that you encourage Massport to work with the Greater Boston communities and with their own Community Advisory Board to seek true and reasonable solutions to increasing air traffic.

Thank you for this opportunity to comment on this matter.

Sincerely,
Constance R. Cecil

303.1	Alternatives	Runway 14/32	I am writing to oppose Massport's plan to construct Runway 14/32 at Logan Airport…Runway 14/32 will allow Massport to operate Logan Airport at a greater capacity than at present…increasing air pollution in communities already suffering the highest rates of asthma in The Commonwealth. Airplanes are not regulated for pollution control….	The Preferred Alternative, and specifically unidirectional Runway 14/32, would not increase Logan Airport's normal airfield capacity of approximately 120 operations per hour. This capacity is available at Logan Airport approximately 80 percent of the time. Runway 14/32 would allow Logan Airport to maintain this capacity during periods of strong northwest winds that now require controllers to operate on only one or two runways, compared to the typical three-runway configurations used at Logan Airport. The runway will not increase Logan Airport's normal operating capacity, nor will it encourage or induce an increase in aircraft operations. Emissions are shown to decrease with the Preferred Alternative when compared to the No Action Alternative. Neither Massport nor the FAA has a program to increase passenger demand at Logan Airport. Rather, the objective of both organizations is to accommodate demand safely and efficiently. The recommended Airside Project is intended to enable Logan Airport to accommodate current and future aircraft activity with minimum delay. The construction of Runway 14/32 would significantly reduce delays associated with northwest wind conditions, but would not be expected to induce additional aircraft traffic or passenger activity at Logan Airport. The principal effect of the Centerfield Taxiway is to reduce the number of aircraft waiting on taxiways, reducing ground noise and emissions for close-in residents of East Boston and Winthrop. Dispersion modeling indicates no violations of the NAAQS at any of the sites shown on Figure 6.4-1 of the Supplemental DEIS/FEIR, including those at public beaches and residential areas.
303.2	Ground Transportation	Access to Logan	Increased vehicles traveling to and from Logan will, IN EVERY INSTANCE travel through these same communities. Many of these vehicles will be diesel…which release a large amount of particulate matter.	Diesel emissions from motor vehicles are included in the air quality analysis.
303.3	Alternatives	Runway 14/32	The economic arguments advanced for this expansion are fallacious…the increase in noise and traffic will devastate many small and medium-sized businesses such as local restaurants, nightclubs and offices, theatres, arts and music venues, the film/location industry…tourist industry which will no longer stay in local bed- and breakfasts and the booming real estate industry.	Section 1.3 of the Supplemental DEIS/FEIR discusses the importance of Logan Airport to the regional economy.
303.4	Alternatives	Preferred Alternative	Airport expansion will create jobs but these jobs are likely to be low-wage, no benefits, dead-end jobs such as chambermaid, airport security, dishwasher etc….	Section 1.2 of the Draft EIS/EIR and Section 1.3 of the Supplemental DEIS/FEIR discuss the importance of Logan Airport to the regional economy.
303.5	Ground Transportation	Access to Logan	Expanded airport traffic will travel over already saturated road before reaching the Central Artery and the Third Harbor Tunnel and further delaying travelers.	Implementation of the Preferred Alternative would not increase capacity, but rather it would correct a series of deficiencies in the airfield geometry and operation. Massport's plans to handle the ground access requirements of future passenger levels are discussed in the *Logan Airport 1999 ESPR* (previously GEIR) and its subsequent Environmental Data Reports (Annual Updates).

COMMENT PROCEDURE for: Draft Logan Airside Improvements (a.k.a. Runway 14/32) **EOEA #10458**

All comments on EIRs (environmental impact report) must refer to the EOEA file number. There may be other identifying numbers, but the EOEA file number is the one which must be used.

Comments not referring to the EOEA file number may not be considered.

LETTER 304

Boston, MA 02202

Failure to address mail in this manner may result in delay of action on comments or no action on comments at all.

Dear Mr. Durand,

My comments to the EIR-Logan Airside Improvements Plan EOEA #10458 are as follows:

The cumulative impact of the increase in flights on ground traffic congestion was not sufficiently addressed in the study. 304.1

The solution is temporary, and does not fully address the transportation needs. We'll be back to the same position in five years 304.2

The number of delays has been artificially estimated and exaggerated. 304.3

The report should be sent back for and reworked

Code	Topic 1	Topic 2	Comment	Response
304.1	Ground Traffic	Access to Logan	The cumulative impact of the increase in flights on ground traffic congestion was not sufficiently addressed in the study.	The Preferred Alternative is not expected to lead to an increase in passenger demand, and therefore, it will have no effect on congestion or delays on Boston area highways. Refer to Section 4.2..
304.2	Alternatives	Runway 14/32	The solution is temporary, and does not fully address the transportation needs. We'll be back to the same position in five years.	Based on simulation modeling, Logan Airport experienced 120,000 hours of runway-related delays in 1998. If no actions are taken, runway-related delays are forecast to grow as high as 333,000 hours under a 37.5M High Fleet scenario. The Preferred Alternative produces immediate and long-term benefits by lowering runway delays by 38,000 hours if it had been in place in 1998, and by as much as 94,000 hours in the future 37.5M High Fleet scenario. Because of the impact of the regional alternatives, the 37.5M High Fleet scenario is not expected to be achieved until 2015. The sooner airside efficiencies are implemented; the more benefits will accrue over time. Section 4.6 of the Supplemental DEIS/FEIR shows that delay reduction benefits increase over time as traffic levels increase.
304.3	Delay	Model	The number of delays has been artificially estimated and exaggerated.	Refer to Section 4.4 of the Supplemental DEIS/FEIR for a discussion on the estimation and modeling of flight delays. It includes a description of FAA and U.S. DOT delay measures and their limitations, an explanation of computer models for estimating flight delays, and historical data on delays at Logan Airport and other major United States airports. The methodology used for the Airside Project includes the effects of constraints at Logan Airport, and produces lower delay estimates than FAA modeling. The FAA approved all the models, which have been validated in previously published studies of Logan Airport.

COMMENT PROCEDURE for: Draft Logan Airside Improvements (a.k.a. Runway 14/32) **EOEA #10458**

All comments on EIRs (environmental impact report) must refer to the EOEA file number. There may be other identifying numbers, but the EOEA file number is the one which must be used.

Comments not referring to the EOEA file number may not be considered.

Boston, MA 02202

Failure to address mail in this manner may result in delay of action on comments or no action on comments at all.

Dear Mr. Durand,

My comments to the EIR-Logan Airside Improvements Plan EOEA #10458 are as follows:

How will you Address The Cumulative Impacts such As Additional Ground Traffic in The Tunnels and Above ground. 305.1

How will you Address Additional Traffic to the MBTA? 305.2

Your Delay Reports are insufficient, especially To my Area of The City.!!

We are currently under attack with environmental diseases, ie Asthma Cancer in The Area. 305.3

305.1	Ground Transportation	Access to Logan	How will you address the cumulative impacts such as additional ground traffic in the tunnels and above ground. How will you address additional traffic to the MBTA?	The Preferred Alternative is not expected to lead to an increase in passenger demand, and therefore, it will have no effect on congestion or delays on Boston area highways. Refer to Section 4.2.
305.2	Delay	Model	Your delay reports are insupportable, especially to my area of the city.	Refer to Section 4.4 of the Supplemental DEIS/FEIR for a discussion on the estimation and modeling of flight delays. It includes a description of FAA and U.S. DOT delay measures and their limitations, an explanation of computer models for estimating flight delays, and historical data on delays at Logan Airport and other major United States airports. The methodology used for the Airside Project includes the effects of constraints at Logan Airport, and produces lower delay estimates than FAA modeling. The FAA approved all the models, which have been validated in previously published studies of Logan Airport.
305.3	Public Health	Effects	We are currently under attack with environmental diseases; i.e., asthma, cancer in the area.	The available public health studies for communities adjacent to Logan Airport were reviewed and are presented in Section 6.8 of the Supplemental DEIS/FEIR. Public health status reports were available for the City of Boston; however, comparable public health reports were not available from the Public Health Departments of Chelsea, Revere, and Winthrop. A review of the available information did not indicate any causal relationship based on proximity to the airport, nor did it identify hearing loss as a public health concern. The available public health studies for communities adjacent to Logan Airport were reviewed and are presented in Section 6.8 of the Supplemental DEIS/FEIR. Public health status reports were available for the City of Boston; however, comparable public health reports were not available from the Public Health Departments of Chelsea, Revere, and Winthrop. A review of the available information did not indicate any causal relationship based on proximity to the airport, nor did it identify hearing loss as a public health concern.

Dear Mr. Durand,

My comments to the EIR-Logan Airside Improvements Plan EOEA #10458 are as follows:

- the ground environmental impacts were not looked at there will be increased traffic thru the city + the airport clog downtown + add ~~to~~ misery to the air. 306.1
- MASSPORT delay data is not accurate delays have been reduced 306.2
- Regional Solutions have been half baked at best in the 70's the reason was they were not able to do anything because the military owned the airports now that they can be used they are not 306.3
- Once again Massport is jamming an unacceptable solution down the throats of the poor communities at the expense of Jeffreys + Route 128 306.4

306.1	Ground Transportation	Access to Logan	The ground environmental impacts were not looked at, these will be increased, traffic through the city and the airport clog downtown and add monoxide to the air.	The Preferred Alternative is not expected to lead to an increase in passenger demand, and therefore, it will have no effect on congestion or delays on Boston area highways. Refer to Section 4.2.
306.2	Delay	Model	Massport delay data is not accurate, delays have been reduced.	Section 1.4 and Appendix C of the Supplemental DEIS/FEIR also contains a discussion of the FAA and U.S. DOT delay measures and historical data, along with comparisons of Logan Airport with other United States airports. The delay situation is not at equilibrium. FAA Opsnet delays at Logan Airport peaked in 1993, declined for two years and are rising again. Arrival delays, which would be directly affected by Runway 14/32, have risen steadily since 1994. In fact, Logan Airport is the second most delayed airport in the nation for arrivals.
306.3	Regional Transportation	Regional Airports	Regional solutions have been half looked at but in the 70s, the reason was they were not able to do anything because the military owned the airports; now that they can be used they are not.	In October 1996, the civilian Naval Air Station Planning Committee rejected redevelopment the South Weymouth Naval Air Station as a commercial airport because of opposition from the surrounding communities – Weymouth, Rockland, and Abington.
306.4	Alternatives	Runway 14/32	Once again Massport is jamming an unacceptable solution down the throats of poor communities at the expense of Lexington and Route 128.	The Environmental Justice analysis in Section 6.8 was expanded for the Supplemental DEIS/FEIR. Low-income and minority populations were defined in accordance with Federal Executive Order 12898, the Final United States Department of Transportation Order, and the Council on Environmental Quality's guidance on environmental justice. In addition, the analysis of low-income populations was expanded to include households at 150 percent of poverty level. This analysis found that there is no high and adverse disproportionate impact to low-income and minority populations caused by the Preferred Alternative. Adverse impacts are not predominately borne by low-income or minority populations. Only 21 percent of the population within the 65 dB DNL contour for the Preferred Alternative is minority, compared to the Suffolk County minority population of 38 percent. Less than two percent of the population within the 65 dB DNL contour for the Preferred Alternative has a household income less than 150 percent of poverty level. The additional area within the 65 dB DNL noise contour associated with the Preferred Alternative includes a predominately Hispanic neighborhood in Chelsea which is predicted under worst case assumptions to experience an increase of 0.6 dB or less. Under FAA standards, this change is not a significant adverse impact. The minority and low-income populations in South Boston and East Boston affected by the Preferred Alternative 65 dB DNL contour are almost identical to the No Action Alternative. The 65 dB DNL contour for the Preferred Alternative does not extend into Jamaica Plain, Roxbury and the South End. Mitigation of the increased noise within the 65 dB DNL contour will be provided to affected communities in the form of residential sound insulation.

Dear Mr. Durand,

My comments to the EIR-Logan Airside Improvements Plan EOEA #10458 are as follows:

The document is seriously flawed and not supported in it's findings. The Ground Environmental impacts are not looked at and the doubling of the number of passengers will increase the Boston area traffic. 307.1

It's my understanding that the planes go over the water for only a mile and then turn to go over the new Seaport area. That area is to have an Opera House; how can that significant attraction be appreciated by the locals or the tourists with so many planes going over? 307.2 307.3

This document presents a short term "solution" which will end up in the same place w/in 5 years. By then, we've tripled the plane noise and will still not have a long term solution.

The fact that MassPort would ask the Inner City to accept and endure more noise goes against the code of Environmental Justice. Massport needs to consider other alternatives. The state needs to look at a secondary airport that incorporates more modes of transportation, including ground, sea and air. 307.4 307.5

Code	Topic 1	Topic 2	Comment	Response
307.1	Ground Transportation	Access to Logan	...the ground environmental impacts are not looked at and the doubling of the number of passengers will increase the Boston area traffic.	The Preferred Alternative is not expected to lead to an increase in passenger demand, and therefore, it will have no effect on congestion or delays on Boston area highways. Refer to Section 4.2.
307.2	Alternatives	Runway 14/32	...the planes go over the water for only a mile and then turn to go over the new Seaport area ...[which will] have an Opera House...[The planes going overhead will adversely affect the Opera House.	The departure paths from Runway 14 are shown in Figures 6.2-3 and 6.2-4. The jet departures from Runway 14 (which would generate the most noticeable noise impacts) continue over water for more than one mile, and the flight tracks are bounded by the existing departures tracks from Runways 22L/R and 33R. Examination of the noise contours in Section 6.2 of the Supplemental DEIS/FEIR shows that the changes in the 65 dB and 70 dB contours due to Runway 14 departures and Runway 32 arrivals occur only over water. Further discussion of the noise impacts of Runway 14/32 can be found in Section 6.2 of the Supplemental DEIS/FEIR.
307.3	Alternatives	Preferred Alternative	This document presents a short term "solution" which will end up in the same place within 5 years...with triple the plane noise and no long term solution.	Based on simulation modeling, Logan Airport experienced 120,000 hours of runway-related delays in 1998. If no actions are taken, runway-related delays are forecast to grow as high as 333,000 hours under a 37.5M High Fleet scenario. The Preferred Alternative produces immediate and long-term benefits by lowering runway delays by 38,000 hours if it had been in place in 1998, and by as much as 94,000 hours in the future 37.5M High Fleet scenario. Because of the impact of the regional alternatives, the 37.5M High Fleet scenario is not expected to be achieved until 2015. The sooner airside efficiencies are implemented; the more benefits will accrue over time. Section 4.6 of the Supplemental DEIS/FEIR shows that delay reduction benefits increase over time as traffic levels increase.

Code	Topic 1	Topic 2	Comment	Response
307.4	Noise	Impacts	...asking the Inner City to accept and endure more noise goes against the Code of Environmental Justice.	The Environmental Justice analysis was expanded for the Supplemental DEIS/FEIR. Low-income and minority populations were defined in accordance with Federal Executive Order 12898, the Final United States Department of Transportation Order, and the Council on Environmental Quality's guidance on environmental justice. In addition, the analysis of low-income populations was expanded to include households at 150 percent of poverty level. This analysis found that there is no high and adverse disproportionate impact to low-income and minority populations caused by the Preferred Alternative. Adverse impacts are not predominately borne by low-income or minority populations. Only 21 percent of the population within the 65 dB DNL contour for the Preferred Alternative is minority, compared to the Suffolk County minority population of 38 percent. Less than two percent of the population within the 65 dB DNL contour for the Preferred Alternative has a household income less than 150 percent of poverty level. The additional area within the 65 dB DNL noise contour associated with the Preferred Alternative includes a predominately Hispanic neighborhood in Chelsea which is predicted under worst case assumptions to experience an increase of 0.6 dB or less. Under FAA standards, this change is not a significant adverse impact. The minority and low-income populations in South Boston and East Boston affected by the Preferred Alternative 65 dB DNL contour are almost identical to the No Action Alternative. The 65 dB DNL contour for the Preferred Alternative does not extend into Jamaica Plain, Roxbury and the South End. Mitigation of the increased noise within the 65 dB DNL contour will be provided to affected communities in the form of residential sound insulation. A discussion of the Environmental Justice analysis is presented in Section 6.8 of Supplemental DEIS/FEIR.
307.5	Regional Transportation	Regional Airports	Massport needs to consider other alternatives...to look at a secondary airport that incorporates more modes of transportation, including ground, sea and air.	The alternative analysis conforms to FAA and MEPA scoping directives. The impact of the regional alternatives has been addressed through the study of a range of forecast activity levels. Refer to Chapter 2 of the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR for a comprehensive discussion of regional alternatives. Massport advocates increased use of the regional airports and high-speed rail services, in addition to construction of Runway 14/32 and the other airside improvement projects at Logan Airport, as a comprehensive plan for ensuring an efficient and balanced regional transportation system. As the analysis in Chapter 2 of this Supplemental DEIS/FEIR indicates, these off-airport alternatives are expected to reduce aircraft traffic growth pressures at Logan Airport, but they will not eliminate airside delays at Logan Airport that occur because of a third operating runway during periods of northwest winds. The Preferred Alternative, which specifically addresses this deficiency, is necessary and provides clear benefits at current aircraft traffic levels. These benefits will only increase in the future, even as developments at the regional airports and high-speed rail to New York act to reduce the rate of future growth at Logan Airport.

Boston, MA 02202

Dear Sir,

We are registered voters in the city of Boston, specifically the neighborhood of Jamaica Plain. We are writing to let you know that we support the conclusions within the enclosed report prepared for the Community Advisory Committee regarding the proposed Runway 14/32 at Logan Airport. 308.1

We strongly urge you to publicly stand with us in opposition on this issue. Please see that the Logan Environmental Impact Statement recommending the new runway be withdrawn. It should be redone with a complete study of all alternatives and a realistic focus on regional transportation and long-term planning. 308.2

Thank you for your attention to this matter.

Re: EIR—Logan Airside Improvements Plan EOEA # 10458

Dear Mr. Durand:

As a Boston resident I am vehemently opposed to the proposed expansion of Logan airport with runway 14/32. This is both an environmental issue and a social equity issue. 309.1

Residents of Boston and neighboring communities cannot be expected to tolerate the increased noise pollution and air pollution that would result from tripling the number of planes passing over our homes, a serious deterioration of urban quality of life. If this proposed airport expansion were to occur I am convinced that more and more people who have the economic choice would flee the noise and fumes of Boston for quieter, more peaceful communities. 309.2

Contrary to what business leaders say, this airport expansion and its resulting impact on the makeup of the city would not be good for Boston—neither good for business nor good for tourism. If Boston is to remain a vital economic and cultural hub of New England it must be a livable city.

I urge you to oppose Runway 14/32 and reject Massport's EIS.

Massport must be forced to explore a truly regional air transportation plan that includes expansion and better utilization of Hanscom, Worcester, TF Green and Manchester airports — and perhaps the construction of a second major metroplitan Boston airport. Furthermore, I feel that the City, the Commonwealth, and Amtrak must move forward 309.3

with the construction of a North-South Rail Link, and the continuing expansion of high-speed inter-city rail service (serving Boston-Worcester, for instance). We rely disproportionately on air transportation because other modes of transportation are outmoded and inadequate. 309.4

Finally, I think it is ridiculous to assert that for Boston to be a major city that it must have its primary airport at Logan, 15 minutes from downtown. Please consider that other major cities — such as London with its two airports — are successfully served by airports that are an hour outside the city.

Sincerely yours,

Donald H. Eunson, Jr.

Letter 309

Code	Topic 1	Topic 2	Comment	Response
309.1	Alternatives	Runway 14/32	I am...opposed to the proposed expansion of Logan airport with runway 14/32...[the] environmental issue [is increased noise and air pollution.]	Comment noted.
309.2	Environmental Justice	Impacts	[The social equity issue is that] residents of Boston and neighboring communities cannot be expected to tolerate the increased noise [and air] pollution ...from tripling the number of planes passing over our homes.	Current traffic trends at Logan Airport and the regional airports indicate that Logan Airport may not reach 29 million passengers, presented in the Airside Project Draft EIS/EIR as a "1999" projection, until 2003. Continued air service expansion at the regional airports and the introduction of high-speed rail to New York in December 2000 is expected to further slow Logan Airport's passenger traffic growth. With these developments, Logan Airport is expected to reach 37.5 million passengers in 2015 rather than 2010, and the 45 million passenger forecasts will not be achieved until 2024. Thus, the planning forecasts that underlie the delays and environmental analyses cover a planning period of at least 20 years. Refer to Section 4.2 of the Supplemental DEIS/FEIR for a complete discussion of the planning forecasts. The Environmental Justice analysis was expanded for the Supplemental DEIS/FEIR in Section 6.8. Low-income and minority populations were defined in accordance with Federal Executive Order 12898, the Final United States Department of Transportation Order, and the Council on Environmental Quality's guidance on environmental justice. In addition, the analysis of low-income populations was expanded to include households at 150 percent of poverty level. This analysis found that there is no high and adverse disproportionate impact to low-income and minority populations caused by the Preferred Alternative. Adverse impacts are not predominately borne by low-income or minority populations. Only 21 percent of the population within the 65 dB DNL contour for the Preferred Alternative is minority, compared to the Suffolk County minority population of 38 percent. Less than two percent of the population within the 65 dB DNL contour for the Preferred Alternative has a household income less than 150 percent of poverty level. The additional area within the 65 dB DNL noise contour associated with the Preferred Alternative includes a predominately Hispanic neighborhood in Chelsea which is predicted under worst case assumptions to experience an increase of 0.6 dB or less. Under FAA standards, this change is not a significant adverse impact. The minority and low-income populations in South Boston and East Boston affected by the Preferred Alternative 65 dB DNL contour are almost identical to the No Action Alternative. The 65 dB DNL contour for the Preferred Alternative does not extend into Jamaica Plain, Roxbury and the South End. Mitigation of the increased noise within the 65 dB DNL contour will be provided to affected communities in the form of residential sound insulation.

309.3	Regional Transportation	Regional Airports	Massport must...explore a truly regional air transportation plan that includes expansion and better utilization of Hanscom, Worcester, TF Green and Manchester airports—and perhaps the construction of a second major metropolitan Boston airport...Other major cities...are successfully served by airports that are an hour outside the city.	Logan Airport is part of a regional system of airports that includes T.F. Green/Providence, Worcester Regional and Manchester airports. Massport has long recognized that service development and increased passenger traffic at these airports are an important part of the region's long-term strategy to accommodate passenger and activity growth. Massport has actively encouraged the development of regional airports and use of other options, including high-speed rail to Logan Airport's largest market, New York. Regional service was examined in Chapter 2 of the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR. This analysis supports the conclusion that greater use of the regional airports will provide passengers within the service area of such airports with a viable alternative to Logan Airport. Since demand within Logan Airport's primary service area will remain strong, the improvements at other regional airports will not eliminate the need for airside projects at Logan Airport. Because the development of a second major airport would require ten to 15 years for site selection and environmental review in addition to a multi-year construction period, this option is not viewed as a solution to accommodating forecast demand over the next 20 years.
309.4	Regional Transportation	Passenger Rail	...the City, the Commonwealth, and Amtrak must move forward with the construction of a North-South Rail Link, and the continuing expansion of high-speed inter-city rail service (serving Boston-Worcester, for instance). We rely disproportionately on air transportation.	The restoration of Portland-Boston rail service was analyzed in the Airside Project Draft EIS/EIR. According to the Portland Rail study, more than 99 percent of travel in the Portland-Boston corridor is by automobile. The same study estimated that restoration of the rail service would have no impact on the amount of travelers using air because the rail travel time is not competitive with the air mode. Additionally, the air market is estimated at only 100,000 annual passengers. This is less than one-half of a percent of Logan Airport's total passenger traffic in 1999. Refer to Section 2.4 of the Airside Project Draft EIS/EIR. Chapter 2 of the Supplemental DEIS/FEIR provides discussion of the entire region's air transportation system and includes a discussion of alternative modes, specifically, high-speed rail and the extent of Massport's active involvement in this area. Refer to response to Comments 6.6 and 6.7.

COMMENT PROCEDURE for: Draft Logan Airside Improvements (a.k.a. Runway 14/32) **EOEA #10458**

All comments on EIRs (environmental impact report) must refer to the EOEA file number. There may be other identifying numbers, but the EOEA file number is the one which must be used.

Comments not referring to the EOEA file number may not be considered.

LETTER 310

Boston, MA 02202

Failure to address mail in this manner may result in delay of action on comments or no action on comments at all.

Dear Mr. Durand,

My comments to the EIR-Logan Airside Improvements Plan EOEA #10458 are as follows:

I oppose the plan to build the runway because I disagree that it will reduce delays in the long run. The better strategy is to address the construction or development of another major airport outside the city of Boston to "share equally" the noise, delay, and high demand problem. 310.1 310.2

I also wish to say that I deeply resent and am offended by Massport's strategy of suggesting that opposition to their plan is unfair to other communities who bear a greater brunt of the noise and traffic airport problems. This strategy was downright wrong, sanctimonious, divisive, and untrue, and it has caused me to contact my elected officials and advise them to pass legislation that diminishes Massport's independence and creates greater legislative oversight.

310.1	Alternatives	Runway 14/32	I oppose the plan to build the runway because I disagree that it will reduce delays in the long run.	Based on simulation modeling, Logan Airport experienced 120,000 hours of runway-related delays in 1998. If no actions are taken, runway-related delays are forecast to grow as high as 333,000 hours under a 37.5M High Fleet scenario. The Preferred Alternative produces immediate and long-term benefits by lowering runway delays by 38,000 hours if it had been in place in 1998, and by as much as 94,000 hours in the future 37.5M High Fleet scenario. Because of the impact of the regional alternatives, the 37.5M High Fleet scenario is not expected to be achieved until 2015. The sooner airside efficiencies are implemented; the more benefits will accrue over time. Section 4.6 of the Supplemental DEIS/FEIR shows that delay reduction benefits increase over time as traffic levels increase.
310.2	Regional Transportation	Regional Airports	...development of another major airport, outside...Boston to "share equally" the noise, delay, and high demand problem./	Because the development of a second major airport would require ten to 15 years for site selection and environmental review, in addition to a multi-year construction period, this option is not viewed as a solution to accommodating forecast demand over the next 20 years. Hanscom Field's potential service area overlaps with the service areas for several airports that already have the necessary infrastructure for commercial service. These airports are the Hanscom Field, T.F. Green/Providence, and Worcester Regional, all which have had or are undergoing major improvements to their terminal buildings, other landside facilities and airfields.

Dear Mr. Durand,

My comments to the EIR-Logan Airside Improvements Plan EOEA #10458 are as follows:

What about the quality of life for people who already feel the impact of the noise. Increased noise will make the City an unbearable place to live. 311.1
~~Wat~~ World class cities don't destroy their city with a plan like this.

This is a short term solution. The problem will still be here if the runway is built. 311.2
A BLUE RIBBON impartial panal is needed to study for another solution to the runway problem.

311.1	Alternatives	Runway 14/32	...for people who already feel the impact of the noise, increased noise will make the city an unbearable place to live.	Implementation of Runway 14/32 would not result in substantial noise impacts in any community. Rather, it would enable the air traffic controllers to adhere more closely to the PRAS goals and decrease the population that is most severely affected. For example, implementation of the Preferred Alternative will reduce the population affected by Day-Night Sound Level values greater than 70 dB by four percent with the 29 M Low Fleet scenario, by 67 percent with the 37.5 M High Fleet scenario, and by 39 percent with the High Regional Jet Fleet, while increasing the population exposed to Day-Night Sound Level values greater than 65 dB by two percent, zero percent, and three percent for these three fleet scenarios, respectively. Refer to Section 6.2.5 of the Supplemental DEIS/FEIR and population counts presented in Tables 6.2-3 through 6.2-8 of the Supplemental DEIS/FEIR.
311.2	Environmental Review Process	Blue Ribbon Panel	This is a short term solution. The problem will still be here if the runway is built. An...impartial panel is needed to study...another solution.	Based on simulation modeling, Logan Airport experienced 120,000 hours of runway-related delays in 1998. If no actions are taken, runway-related delays are forecast to grow as high as 333,000 hours under a 37.5M High Fleet scenario. The Preferred Alternative produces immediate and long-term benefits by lowering runway delays by 38,000 hours if it had been in place in 1998, and by as much as 94,000 hours in the future 37.5M High Fleet scenario. Because of the impact of the regional alternatives, the 37.5M High Fleet scenario is not expected to be achieved until 2015. The sooner airside efficiencies are implemented; the more benefits will accrue over time. Section 4.6 of the Supplemental DEIS/FEIR shows that delay reduction benefits increase over time as traffic levels increase. In January 2000, in response to the FAA's review of the Draft EIS, the FAA called for preparation of a Supplemental Draft EIS to address specific issues identified by the FAA following input from a SDEIS Panel consisting of six persons. At the FAA's direction, three SDEIS Panel members were appointed by the Governor of the Commonwealth of Massachusetts and three were appointed by the Mayor of the City of Boston.

Dear Mr. Durand,

My comments to the EIR-Logan Airside Improvements Plan EOEA #10458 are as follows:

I am deeply concerned about the impact Runway 14/32 will have on the environment. Massport has not studied the cumulative environmental impact. What will happen to the quality of life around the airport? What will the effects be on the ground & in the air? As a Jamaica Plain resident, I feel Massport must do a much more thorough and accurate study on the impact their actions will have on the environment. 312.1

Sincerely,
Jacqueline Gambarini

312.1	Alternatives	Runway 14/32	I am...concerned about the impact Runway 14/32 will have on the environment. Massport has not studied the cumulative environmental impact...on the ground and in the air...Massport must do a much more thorough and accurate study on the impact...on the environment.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR analyze the environmental impacts of the Airside Project, consistent with established federal and state scoping directives. Appropriate mitigation associated with the Airside Project has also been established. Massport has programs in place to reduce the environmental impacts associated with Logan Airport as a whole. These initiatives are described in the *Logan Airport ESPR* and its updates.

313.1	Alternatives	Preferred Alternative	[Runway 14/32] is ill conceived and short sighted. Please...develop a more comprehensive transportation plan for a long term solution.	The improvement concepts evaluated in the Airside Project Analysis evolved from prior studies including the FAA's *Logan Capacity Enhancement Plan* (October 1992); the *Logan Runway Incursion Mitigation Plan/Taxiway Relocation Study* (December 1993); the *Logan Final GEIR* (July 1993); and the *Logan Airside Improvements Feasibility Study, Phase 1 Report*, published in July 1995. The FAA evaluated a numerous physical, operational, and administrative concepts for reducing Logan Airport delays in its *Boston Logan International Airport Capacity Enhancement Plan.* The FAA recommended several improvement concepts, including unidirectional Runway 14/32, for further study. These improvement concepts, as well as concepts from other studies, were individually examined by Massport in the *Logan Airside Feasibility Study*, published in July 1995. Based on the Feasibility study, some concepts were rejected and the most promising concepts were combined into the Alternatives considered in the Airside Project Draft EIS/EIR. The alternatives analysis in the Airside Project Draft EIS/EIR is consistent with state and federal scoping directives for the Airside Project. The results of the Airside analysis indicate that alternatives that include unidirectional Runway 14/32 provide the most benefit in terms of delay reduction and ability to achieve PRAS goals.

Dear Mr. Durand,

My comments to the EIR-Logan Airside Improvements Plan EOEA #10458 are as follows:

As of 1997 there are flights which caused a great increase in traffic directly over our house in the Bowdoin section of Jamaica Plain. What was once a quiet neighborhood is now noisy because of Mass Port/FAA unwillingness to disperse flights in multiple paths over other parts of JP and Roxbury - runways 27. The last thing I want is more flights over my home. We in the Bowdoin/Geneva corridor 14/32, EOEA #10458 314.1 314.2

Re:	Comments on FAA & Massport EIS	**Pages:**	3
CC:	Legislators, City Councilors, EPA		

x **Urgent** ☐ **For Review** x **Please Comment** x **Please Reply** ☐ **Please Recycle**

I could not attend the Airport meetings but want to voice my concerns re:

1. Fair distribution of flight increase - Massport means a more equal distribution over current flight parths; not a fair and equal distribution of flights across all neighborhoods. Among those effected, some neighborhoods will have less, others more, **but many will have none!** Is that fair? I cannot imagine my family's quality of life or the plummeting real estate values in the Parkside neighborhood of J.P. once there are 56,000 more flights overhead every year, and that increase is only the beginning of a business that is intent on growth. On weekend mornings in our neighborhood, outdoors one has to stop talking when the planes fly over, because of the excessive noise. After the community's 20 year fight, a law suit and an environmental impact study, Massport aligned all Runway 27 flights over Franklin Park - an area set aside to provide a retreat from urban noise and activity. The decision to move the flight path over Franklin Park was Massport's answer to a quality of life comlaints. So, Instead of addressing the source of and quality of noise impact, Massport just moved the noise to an area where it effected 6,000 fewer people. Is that intelligent problem solving. **And in reality, it doesn't affect fewer people-the planes fly over my house.** 315.1 315.2
2. Noise levels: The FAA states that noise levels will improve as of 2000, because of new requirements on jet engine noise levels. However, the FAA states they have no jurisdiction over small planes or helicopters. 315.3

3. No. of flights per day: Currently, those of us in the northwest flight path have a relief from the constant drone and frequent screams of overhead planes when the winds blow from other directions. The proposed new runway will allow Massport to schedule flights over Jamaica Plain at any time. I start hearing the planes at 6:09 on weekend mornings, and the intervals between planes seems as brief as 1-2 minutes apart. 315.4

4. Increase in number of flights, unacceptable noise levels and intervals between flyovers. These are the key impact issues. But my research has unearthed problems that interfere with resolving any of these issues to the community's satisfaction. Jurisdiction – there is no one entity with the authority to make all the decisions. The FAA has control over flight paths but not the number of planes allowed to land at any one airport. Apparently, no entity can say – enough is enough. We cannot accommodate any more planes at Logan. The FAA and Massport claim they have to accommodate every plane that wants to land. 315.5

5. Community Input opportunities – the environmental impact community process – By the time the environmental impact process is in place, we are all locked into a procedure that does not allow for problems solving. There are rules and regulations on procedures and authority that keep plans fixed in place. This means the community raises questions. Massport answers by defending its positions and plans. Whats the point. 315.6

6. When I talk to the FAA, they answer one question at a time with answers framed by their regulatory authority. They respond with limited, specific information to each question. They are not organized or authorized to solve problems. They only give out information . They have no obligation to paint the whole picture – or to give all the facts and implications of the facts.

7. Here are questions which I would like discussed? Why don't we have a regional authority that has the authority/capacity to direct airport use with the mandate to set limits on Logan's capacity. Business passengers can get to Boston or their destinations at Rte 128 or Rte495 just as quickly from outside in to the City as through the phenomenal traffic jams between the airport and the tunnels and then west. 315.7

8. If the airport has fewer delays, then more planes will be attracted to Logan. It is a fact that the proposed new runway is only a temporary solution, pushing the discussion into 2002 on how much air traffic is too much. All businesses are in the business to grow. Let Massport grow 315.8

in its regional capacity-not in East Boston only and at the sacrifice of the residents and neighborhoods Boston has been working to revitalize for the last 25 years. Protect your constituents. We have invested in this City. You spend Federal dollars to revitalize City neighborhoods. Are we out to undermine the efforts of the last 2 decades? Haven't we learned our lesson around neglect, degradation, blight. Improve the quality of life, do not diminish it.

9. Do not sacrifice us. Businesses in Boston will continue to flourish and grow as long as you protect the quality of life in Boston. There are always new ways to make money. Witness the invention of the condominium. Nothing physically changed. A concept – a way of thinking about a physical resource changed and suddenly landlords had the opportunity to increase the value of their holdings by doing nothing but changing the ownership structure. Massport needs to make a paradigm shift. They wouldn't have even discussed taking over Worcester Airport if the communities had not risen up against Runway 14/32. And now they say they can't help Worcester immediately because of lack of road access. What about public transportation-commuter rail. Wait to impose 14/32 until Worcester access is solved. See if we need it. 315.8 (cont.)

10. Do not allow any process to proceed which will allow Runway 14/32 to become a reality until other ideas have been implemented and the effects observed. Once you build it, you will not be able to turn back. We will suffer forever – and the suffering will increase endlessly.

11. Mitigation is useless – who can soundproof the outdoors – **make the jet engine manufacturers produce quieter planes, planes with no jet fuel sprays.** 315.9

12. Make the airlines meet all maintenance requirements – **prevent parts from falling out onto people's backyards.** Do all of these things and then talk to us about Runway 14/32. 315.10

13. Another important violation of the EIS is that Runway 27 flight path is over almost every public housing complex from South Boston through the Washington Street Corridor. 315.11

including Castle Square, Orchard Park, Academy Homes (I've left out a few) – and then it destroys the tranquility of Franklin Park. Too bad we don't have Hollywood types like Don Henley and Whoopi Goldberg protecting Franklin Park the way they protect Walden Pond.

Sincerely,

Arthur L. Johnson 48 Robeson Street, Jamaica Plain 02130

315.1	Noise	Runway Use	Massport...[does not propose] a fair and equal distribution of flights across all neighborhoods...some neighborhoods will have less, others more, but many will have none...Massport aligned all Runway 27 flights over Franklin Park [to address quality of life complaints and to affect 6,000 fewer people]...instead of addressing the source of and quality of noise impact.	The Supplemental DEIS/FEIR projects that the Preferred Alternative would promote runway use in a manner that is more consistent with annual PRAS goals. The total number of departures from Runway 27 (over South Boston, Roxbury, and Jamaica Plain) would increase, but the number of equivalent jet operations would remain essentially the same. The difference in these communities would be fewer nighttime operations and more daytime operations but the same noise impacts. Total departures from Runway 33L and arrivals to Runway 15R (over East Boston and Chelsea) would increase, but most of these are non-jets. These runway operations are currently running well below the PRAS goals, and the unidirectional Runway 14/32 would allow the controllers to approach, but still remain below the annual goals for these operations. Additionally, by increasing the number of operations over water, Runway 14/32 would reduce the total annual hours of dwell and persistence over populated areas in accordance with short-term PRAS goals. The Supplemental DEIS/FEIR projects that the Preferred Alternative would promote runway use in a manner that is more consistent with annual PRAS goals. The total number of departures from Runway 27 (over South Boston, Roxbury, and Jamaica Plain) would increase, but the number of equivalent jet operations would remain essentially the same. The difference in these communities would be fewer nighttime operations and more daytime operations but the same noise impacts. Total departures from Runway 33L and arrivals to Runway 15R (over East Boston and Chelsea) would increase, but most of these are non-jets. These runway operations are currently running well below the PRAS goals, and the unidirectional Runway 14/32 would allow the controllers to approach, but still remain below the annual goals for these operations. Additionally, by increasing the number of operations over water, Runway 14/32 would reduce the total annual hours of dwell and persistence over populated areas in accordance with short-term PRAS goals.
315.2	Noise	Runway Use	...my family's...real estate values [will plummet] in the Parkside neighborhood of Jamaica Plain once there are 56,000 more flights overhead every year.	Refer to response to Comment 315.1.
315.3	Noise	Impacts	The FAA states that noise levels will improve as of 2000, because of new requirements on jet engine noise levels. However, the FAA states they have no jurisdiction over small planes or helicopters.	The FAA has rulemaking authority over the noise levels of all new aircraft, including light airplanes and helicopters. In fact there are provisions of FAR Part 36 that apply to those aircraft types.
315.4	Alternatives	Runway 14/32	Currently, those of us in the northwest flight path have a relief from...overhead planes when the winds blow from other directions. The proposed new runway will allow Massport to schedule flights over Jamaica Plain at any time...Increase in number of flights, unacceptable noise levels and intervals between flyovers...are the key impact issues.	The Supplemental DEIS/FEIR projects that the Preferred Alternative would promote runway use in a manner that is more consistent with annual PRAS goals. The total number of departures from Runway 27 (over South Boston, Roxbury, and Jamaica Plain) would increase, but the number of equivalent jet operations would remain essentially the same. The difference in these communities would be fewer nighttime operations and more daytime operations but the same noise impacts.

315.5	Environmental Review Process	FAA/NEPA	...there is no one entity with the authority to make all the decisions. The FAA has control over flight paths but not the number of planes allowed to land at any one airport. Apparently, no entity can say—enough is enough...The FAA and Massport claim they have to accommodate every plane that wants to land. When I talk to the FAA...they respond with limited, specific information to each question...they have no obligation to paint the whole picture—or to give all the facts and implications of the facts...Why don't we have a regional authority that has the authority/ capacity to direct airport use with the mandate to set limits on Logan's capacity.	Federal constitutional provisions (preemption, commerce clause, equal protection), federal aviation statutes and regulations, and contractual provisions related to covenants in connection with the Federal Airport Improvement Program grants which Massport receives, restrict Massport's ability to limit the number of aircraft operations. Since Aviation Deregulation in 1979, airlines have been free to select their own markets, schedules and equipment without Federal, State or local intervention.
315.6	Environmental Review Process	Public Process	...the environmental impact community process [is inadequate]—By the time the environmental impact process is in place, we are all locked into a procedure that does not allow for problems solving...[Instead] Massport...defending its position and plans,	There was an extensive public participation and review process during the preparation of the Airside Project Draft EIS/EIR. Public comments were received on the ENF after it was filed during the summer of 1995. In the fall of 1995, several public scoping sessions were held to provide community input to the subsequent state and federal scopes for the project. To assure that the Airside analysis was conducted with awareness and input from all concerned parties, the Massport Board established the Airside Review Committee (ARC), which consists of the Community Advisory Committee (with representatives from 24 communities surrounding Logan Airport), and 11 businesses and industry organizations. Massport also funded independent consultants for the CAC to provide them with the capacity to professionally assess the analysis and conclusions of the Airside Study. Between 1995 and 1999, Massport held 16 meetings with the ARC, an additional 15 meetings with just the CAC, and several meetings with the CAC consultants. In addition, Massport made 29 presentations to elected officials, most of whom represent Logan Airport's neighboring communities, and Massport held 45 meetings with community and business leaders, reaching an audience of more than 3,000 people. During the public comment period on the Airside Project Draft EIS/EIR, the FAA held two public hearings. In January 2000, in response to the FAA's review of the Draft EIS, the FAA called for preparation of a Supplemental Draft EIS to address specific issues identified by the FAA following input from a SDEIS Panel consisting of six persons. At the FAA's direction, three SDEIS Panel members were appointed by the Governor of the Commonwealth of Massachusetts and three were appointed by the Mayor of the City of Boston. Under the direction of the New England Region FAA, the SDEIS Panel convened in March of 2000 and then met at least monthly with a final meeting in December of 2000. A total of 12 meetings were held. To provide the appropriate background, the SDEIS Panel was presented with an Interim Supplemental Draft EIS, the Draft EIS/EIR, answers to key letters written by members of the public, concerned agencies and public officials responding to the Draft EIS/EIR, and a series of 15 visual and written presentations from the Project's technical consulting team and other independent industry experts.

Code	Topic 1	Topic 2	Comment	Response
315.7	Regional Transportation	Regional Airports	Business passengers can get to Boston or their destination at Route 128 or Route 495 just as quickly from outside in to the City as through the phenomenal traffic jams between the airport and the tunnels and then west...Let Massport grow in its regional capacity....	Logan Airport is part of a regional system of airports that includes T.F. Green/Providence, Worcester Regional and Manchester airports. Massport has long recognized that service development and increased passenger traffic at these airports are an important part of the region's long-term strategy to accommodate passenger and activity growth. Massport has actively encouraged the development of regional airports and use of other options, including high-speed rail to Logan Airport's largest market, New York. Regional service was examined in Chapter 2 of the Draft EIS/EIR and the Supplemental DEIS/FEIR. This analysis supports the conclusion that greater use of the regional airports will provide passengers within the service area of such airports with a viable alternative to Logan Airport. Since demand within Logan Airport's primary service area will remain strong, the improvements at other regional airports will not eliminate the need for airside projects at Logan Airport. With recent service developments, Manchester and T.F. Green/Providence airports are becoming attractive options for air passengers that originate in communities north and south of Routes I-95 and I-495. By its agreement to assume operational responsibility and the eventual ownership of the Worcester Regional Airport, Massport is working to increase air services at Worcester Regional Airport and is working to increase the airport's role in accommodating air travel demand generated in communities west of I-95 and I-495.
315.8	Alternatives	Runway 14/32	...the proposed new runway is only a temporary solution...Massport needs to make a paradigm shift...Wait to impose 14/32 until [ground transportation access to] Worcester...is solved. See if we need it...Do not...allow Runway 14/32 to become a reality until other ideas have been implemented and the effects observed.	Chapter 2 of the Supplemental DEIS/FEIR provides a discussion of the specific role played by the regional transportation alternatives and steps that Massport has taken to foster use of these alternatives. Massport has long recognized and has been a proponent of options to Logan Airport. Together with the regional airports, Massport has implemented a regional strategy to enhance the use of options to Logan Airport. In the Airside Project Draft EIS/EIR, Massport identified up to 7.3 million annual passengers that could be absorbed by regional alternatives that include use of T.F. Green/Providence, Manchester and Worcester Regional airports, as well as the new high-speed rail to New York. In the Supplemental DEIS/FEIR, Massport recognizes that these developments will slow Logan Airport's passenger traffic growth. Logan Airport may not achieve the 37.5 million passenger forecasts until after 2010, but rather closer to 2015, and the 45 million passenger forecasts may not be achieved until after 2020. While regional alternatives can play an important role in reducing the rate of future traffic growth at Logan Airport, they do not address Logan Airport's inability to efficiently accommodate current levels of demand during northwest wind conditions. Runway 14/32, which is designed to correct the problem with Logan Airport's layout, is necessary to correct this deficiency and provides clear benefits at current aircraft traffic levels. These benefits will only increase in the future, even as developments at the regional airports act to reduce the rate of future growth at Logan Airport.
315.9	Noise	Sound Insulation	Mitigation is useless—who can soundproof the outdoors—make the jet engine manufacturers produce quieter planes, planes with no jet fuel sprays.	The FAA has preemptive rule-making authority for quieting aircraft at the source. Neither Massport nor any entity other than the FAA can force manufacturers to comply with noise limits.

Code	Topic 1	Topic 2	Comment	Response
315.10	Alternatives	Runway 14/32	Make the airlines meet all maintenance requirements—prevent parts from falling out onto people's backyards.	All United States and foreign airlines operating at Logan Airport must comply with very strict maintenance procedures and inspections to prevent such incidents. Runway 14/32 will reduce the number of flights over populated areas and increase them over the harbor.
315.11	Environmental Justice	Impacts	...Runway 27 flight path is over almost every public housing complex from South Boston through the Washington Street Corridor....	Winthrop is actually the most severely affected by high noise exposure levels, now and in the future regardless of which alternative is implemented. However, the Preferred Alternative will provide some noise benefit to Winthrop, as well as to parts of East Boston and Revere that are also exposed to higher noise levels than South Boston. Low income and minority populations were defined in accordance with Federal Executive Order 12898, the Final United States Department of Transportation Order, and the Council on Environmental Quality's guidance on environmental justice. In addition, the analysis of low-income populations was expanded to include households at 150 percent of poverty level. The data presented are based on the most recently available census data (1990) using Geographic Information System (GIS) technology to analyze impacts at the most detailed level possible. Refer to Sections 6.8.3 and 6.8.5 of the Supplemental DEIS/FEIR for a discussion of the analytical methodology and results, respectively.

LETTER 316

BARBARA KAPLAN
PLANNING & DEVELOPMENT

April 7, 1999

Mr. Arthur Pugsley
MA Environmental Protection Agency
100 Cambridge Street
Boston, MA 02110

Dear Mr. Pugsley:

I urge you to oppose Runway 14/32. Its development has little to do with delay reduction and everything to do with expansion of capacity at Logan. The runway plan is not about improving service for passengers. Its about allowing for undirected, limitless growth. There are many other ways to improve service. **Give us a chance to let you know our ideas.** Massport should be conducting a comprehensive planning process, with residents at the planning table before they push forward with changes at Logan. Their planning process should take into account regional resources, existing and potential intermodal transportation improvements, the future of Boston as a world class city, and the quality of life for those residents who have made a commitment to remain in the City. 316.1 316.2

Residents of Boston and surrounding areas who already bear an unfair portion of the noise, air pollution and auto traffic caused by Logan will be permanently, negatively impacted with triple the amount of planes passing over our homes, if 14/32 is built. We need airport RELIEF, not additional negative impacts! 316.3

The Parkside neighborhood of Jamaica Plain, where I live, abuts Franklin Park. It is now right under the flight path of Runway 27. Flights operate at one minute intervals for takeoffs starting at 6:00am on the days when there is a northwest wind, allowing for no relief from the constant drone overhead. Massport states that "56,000 and growing" flights is the "fair" number projected annually for this neighborhood. When and if they build Runway 14/32 which will work in combination with Runway 27, there will be flights every day over my neighborhood, regardless of wind direction. This number, "56,000 and growing" they say, represents only 17% of all Logan flights. However, 17% translates into an *instant* "40,000" *additional* flights and growing" over my house annually. The prospect is *appalling*. I am already negatively effected by 17,000 – 18,000 planes a year. The other morning, there were a minimum of five, if not six planes roaring overhead in just seven minutes, and this is a common pattern. 316.4

Runway 27's flight path burdens Parkside with Excessive noise, vibrations, environmental pollutions, health and safety factors. This flight path was moved over our heads within the last two years. What a surprise to those of us who had been living in this quiet neighborhood for decades, even generations. In response to a suit against Massport filed by the Runway 27 Coalition, Massport moved the flight path over Franklin Park where it now effects a predominantly poor, minority neighborhood. Instead of addressing the underlying causes of noise and environmental pollution brought up in the suit, Massport chose a cheap and short-sighted tactic – just push the problem southward. This strategy exposed Massport's modus operandi – Find a quick and dirty solution and push it through by riding herd over residents valid concerns. 316.5

Massport never notified Parkside residents that their neighborhood was about to be degraded. They just violated our pristine environment and Boston's unique and historic urban park – site of wild woods, peaceful overlooks, playing fields, a golf course, and a Zoo, all recently upgraded

with mega-dollars of City improvements. Pushing the flight path over our heads was Massport's easy out. **Once again, Massport avoided/ignored the opportunity to create a visionary longterm "real" improvement plan for Logan** and its neighbors. Massport's own data documented that the problems – high levels of noise, air pollution, health and safety factors would remain the same. The only thing that would change was that 6,000 fewer households would be subjected to the impact of the Runway 27 flight path. Did Massport acknowledge that the newly effected area would be home to thousands of minority and poor residents and that it was violating federal laws prohibiting the shunting of environmental problems onto minority neighborhoods. Did they approach the Parkside Neighborhood Association to inquire about the current impact of their flight path on our neighborhood, before they decided to triple the impact. **No!**

Runway 27's flight path affects Parkside residents in at least four ways:

1. The planes not only inflict unacceptable noise levels to the area which force residents to interrupt conversations out-doors until they pass overhead, but they also drone out TV and radio programs indoors.
2. The planes turn north or south towards their final destination over our heads as well. The turn doubles the noise impact by lengthening the duration of noise overhead and shortening the relief of no noise intervals between flights.
3. To make matters worse, many of the planes fly at lower altitudes over Jamaica Plain than do similar flights leaving from other runways. At lower heights, noise levels are louder, further increasing the noise level.
4. The neighborhood faces the prospect of perpetual growth at Logan, *so that the number of flights will continue to increase whether or not Massport builds Runway 14/32.*

316.5 (cont.)

With these five pre-existing conditions, the neighborhood is already demoralized and degraded. Adding "forty thousand and growing" more planes annually, will exacerbate an intolerable situation. Who is there who can put a limit on perpetual growth at Logan? Both Massport and the FAA claim they cannot limit landings. Who can? What is the answer to that and hundreds of other questions that residents never get a chance to ask or have answered fully. I am frustrated with the public forums. Too many prepared speeches – too few honest and informed discussions. There is never enough time to obtain accurate and complete answers to questions. Although public meetings are forums for the public to voice opposition and raise issues, they do not offer the opportunity to sort out any one idea or issue.

316.6

Do we have to leave it to the lawyers and courts or can you require Massport to look to the causes and make a paradigm shift in their planning process. Massport does not discuss issues. They spew facts and figures – the ones they want to present. They are masters at public relations. They are not problem solvers; they are defenders of their plans. They have an answer for everything and dismiss arguments with their own opposing statistics, platitudes and, often a patronizing attitude. What they don't say is key, but there is never enough time to identify the gaps in their arguments. They are self-righteous about not dealing with issues over which they have no jurisdiction and therefore they propose solutions by default. Although it takes longer to effect change at a federal level, Massport can work with the FAA to do so, and they do when it is in their interest. At public forums, they hide behind jurisdictional divides to suit their purposes.

316.7

Can you, and if not you, who can force Massport to work with all parties affected and involved to produce a workable, long-range, plan that addresses long-term growth? This must take place before Massport creates more and bigger problems with its short term, short-sighted solutions. As delays have actually been reduced in the last several years, Massport can and should wait before attempting to implement Runway 14/32. It is a strategy that they themselves acknowledge will only reduce the impact over some neighborhoods by 20% initially. They also acknowledge that there will be increased use of the airport every year, completely eliminating any short term benefits they gain. **Most importantly, they ignore the fact that Runway 14/32 will instantly,**

316.8
316.9
316.10

316.11

permanently harm residents by imposing over "40,000 and growing" more flights over neighborhoods, instantly, permanently degrading quality of life and real estate values.

I beg you and others with authority to intervene, to have Massport withdraw their one-sided and incomplete environmental report now.

- Do not allow their skillfully coordinated public relations effort eliminate the injunction on Airport expansion .
- Do not approve their environmental impact statement.
- Do not let them proceed to the next legal level.
- Stop them now while there is still a chance for a rational discussion, regional, intermodal, participatory planning.
- Include all involved, affected parties and those with creative ideas in the planning process.

Boston will continue to grow and benefit economically whether it takes ¾ hr to get to Boston via a backed up tunnel or bridge or on the MA pike. It has grown despite all the current problems that Massport claims. *Everyone will benefit, Massport included, if the push to change is halted and Massport involves residents and other outside interests at the planning table, not just in the audience during comment periods.*

I believe everyone would avoid the traffic jams at Logan if they had another option. When I visit Washington, I take advantage of lower fares and easier access by flying to Dulles. Boston could offer similar options within its greater metropolitan area. To do this well, there has to be an intermodal transportation plan. Buses and commuter rail have to get people to the various airports along with diverse roadway approaches. ***It can be done. Lets do it.*** Proscribe that all the parties and others with creative solutions work together to develop a structural solution that best meets everyone's concerns and needs.

Do not turn your back on the cities and towns that bear the burden of Logan. When "40,000 and growing" additional planes are allowed to fly over our heads under Runway 27 flight path – many will flee their neighborhoods, repeating the abandonment of the City that took place over a generation ago. An instantaneous increase of "40,000 and growing" flights overhead is unthinkable.

Would you stand for that environmental degradation over your house and yard? I don't think so.

Thank you for your attention to my concerns.

Barbara Kaplan

316.1	Alternatives	Runway 14/32	I urge you to oppose Runway 14/32, [which]...has little to do with delay reduction and everything to do with expansion of capacity at Logan.	The Preferred Alternative, and specifically unidirectional Runway 14/32, would not increase Logan Airport's normal airfield capacity of approximately 120 operations per hour. This capacity is available at Logan Airport approximately 80 percent of the time. Runway 14/32 would allow Logan Airport to maintain this capacity during periods of strong northwest winds that now require controllers to operate on only one or two runways, compared to the typical three-runway configurations used at Logan Airport. The runway will not increase Logan Airport's normal operating capacity, nor will it encourage or induce an increase in aircraft operations.

Code	Topic 1	Topic 2	Comment	Response
316.2	Environmental Review Process	Public Process	There are many other ways to improve service. Massport should be conducting a comprehensive planning process...residents [should be] at the planning table before they push forward with changes at Logan. The planning process should take into account regional resources, existing and potential intermodal transportation improvements...and the quality of life....	There was an extensive public participation and review process during the preparation of the Airside Project Draft EIS/EIR. Public comments were received on the ENF after it was filed during the summer of 1995. In the fall of 1995, several public scoping sessions were held to provide community input to the subsequent state and federal scopes for the project. To assure that the Airside analysis was conducted with awareness and input from all concerned parties, the Massport Board established the Airside Review Committee (ARC), which consists of the Community Advisory Committee (with representatives from 24 communities surrounding Logan Airport), and 11 businesses and industry organizations. Massport also funded independent consultants for the CAC to provide them with the capacity to professionally assess the analysis and conclusions of the Airside Study. Between 1995 and 1999, Massport held 16 meetings with the ARC, an additional 15 meetings with just the CAC, and several meetings with the CAC consultants. In addition, Massport made 29 presentations to elected officials, most of whom represent Logan Airport's neighboring communities, and Massport held 45 meetings with community and business leaders, reaching an audience of more than 3,000 people. During the public comment period on the Airside Project Draft EIS/EIR, the FAA held two public hearings. In January 2000, in response to the FAA's review of the Draft EIS, the FAA called for preparation of a Supplemental Draft EIS to address specific issues identified by the FAA following input from a SDEIS Panel consisting of six persons. At the FAA's direction, three SDEIS Panel members were appointed by the Governor of the Commonwealth of Massachusetts and three were appointed by the Mayor of the City of Boston. Under the direction of the New England Region FAA, the SDEIS Panel convened in March of 2000 and then met at least monthly with a final meeting in December of 2000. A total of 12 meetings were held. To provide the appropriate background, the SDEIS Panel was presented with an Interim Supplemental Draft EIS, the Draft EIS/EIR, answers to key letters written by members of the public, concerned agencies and public officials responding to the Airside Project Draft EIS/EIR, and a series of 15 visual and written presentations from the Project's technical consulting team and other independent industry experts. The alternative analysis conforms to FAA and MEPA scoping directives. The impact of the regional alternatives has been addressed through the study of a range of forecast activity levels. Refer to Chapter 2 of the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR for a comprehensive discussion of regional alternatives. Massport advocates increased use of the regional airports and high-speed rail services, in addition to construction of Runway 14/32 and the other airside improvement projects at Logan Airport, as a comprehensive plan for ensuring an efficient and balanced regional transportation system. As the analysis in Chapter 2 of this Supplemental DEIS/FEIR indicates, these off-airport alternatives are expected to reduce aircraft traffic growth pressures at Logan Airport, but they will not eliminate airside delays at Logan Airport that occur because of a third operating runway during periods of northwest winds. The Preferred Alternative, which specifically addresses this deficiency, is necessary and provides clear benefits at current aircraft traffic levels. These benefits will only increase in the future, even as developments at the regional airports and high-speed rail to New York act to reduce the rate of future growth at Logan Airport.

Code	Topic 1	Topic 2	Comment	Response
316.3	Alternatives	Runway 14/32	Residents of Boston and surrounding areas who already bear an unfair portion of the noise, air pollution and auto traffic caused by Logan will be permanently, negatively impacted with triple the amount of planes passing over our homes, if 14/32 is built.	The Supplemental DEIS/FEIR projects that the Preferred Alternative would promote runway use in a manner that is more consistent with annual PRAS goals. The total number of departures from Runway 27 (over South Boston, Roxbury, and Jamaica Plain) would increase, but the number of equivalent jet operations would remain essentially the same. The difference in these communities would be fewer nighttime operations and more daytime operations but the same noise impacts.
316.4	Alternatives	Runway 14/32	The Parkside neighborhood...is...right under the flight path of Runway 27. Flights operate at one minute intervals...starting at 6:00 a.m...when there is a northwest wind, allowing for no relief...Massport states that "56,000 and growing" flights is the "fair" number projected annually for this neighborhood. [an increase of 40,000 flights annually]...if they build Runway 14/32...there will be flights every day over my neighborhood, regardless of wind direction.	The Supplemental DEIS/FEIR projects that the Preferred Alternative would promote runway use in a manner that is more consistent with annual PRAS goals. The total number of departures from Runway 27 (over South Boston, Roxbury, and Jamaica Plain) would increase, but the number of equivalent jet operations would remain essentially the same. The difference in these communities would be fewer nighttime operations and more daytime operations but the same noise impacts. The Preferred Alternative, and specifically unidirectional Runway 14/32, would not increase Logan Airport's normal airfield capacity of approximately 120 operations per hour. This capacity is available at Logan Airport approximately 80 percent of the time. Runway 14/32 would allow Logan Airport to maintain this capacity during periods of strong northwest winds that now require controllers to operate on only one or two runways, compared to the typical three-runway configurations used at Logan Airport. The runway will not increase Logan Airport's normal operating capacity, nor will it encourage or induce an increase in aircraft operations.
316.5	Environmental Justice	Impacts	Runway 27's...flight path was moved over our heads within the last two years. In response to a suit against Massport filed by the Runway 27 Coalition, Massport moved the flight path over Franklin Park where it now effects a predominantly poor, minority neighborhood. ...Massport chose a ...short-sighted tactic [and relocated the flight path to affect 6,000 fewer households]...Massport never notified Parkside residents that their neighborhood was about to be degraded [by relocating the flight path of Runway 27] ...Runway 27's flight path...inflicts unacceptable noise levels, ...[which is extended in duration when] the planes turn north or south towards their final destination over our heads...many of the planes fly at lower altitudes over Jamaica Plain than do similar flights leaving from other runways...the number of flights will continue to increase whether or not Massport builds Runway 14/32.	It is the FAA, not Massport, who was responsible for evaluating and implementing the new departure procedure for Runway 27, and it is the FAA who continues to refine the procedure so that aircraft might improve their conformance with the desired corridor specified by the FAA in its Record Of Decision for the Runway 27 EIS. FAA provided notice and opportunity for comment throughout the Runway 27 EIS process as required by law. The Preferred Alternative with the added flexibility afforded by the new unidirectional Runway 14/32 will result in greater use of Runway 27 than currently exists and will cause increased noise in Jamaica Plain but at DNL levels well below 60 dB.
316.6	Environmental Review Process	FAA/NEPA	Who is there who can put a limit on perpetual growth at Logan? Both Massport and the FAA claim they cannot limit landings. Who can?	The Airside Project will not change Logan Airport's airfield capacity of approximately 120 aircraft operations per hour. Regarding caps on airport operations, federal constitutional provisions (preemption, commerce clauses, equal protection), federal aviation statutes and regulations, and contractual provisions related to covenants in connection with the Federal Airport Improvement Program grants which Massport receives, restrict Massport's ability to control the number of aircraft operations at Logan Airport. Massport has undertaken a comprehensive mitigation program, such as Logan Airport Noise Rules, for those areas that fall within its powers as proprietor of Logan Airport, which are not preempted under federal law.

Code	Topic 1	Topic 2	Comment	Response
316.7	Environmental Review Process	Public Process	I am frustrated with the public forums. Code	Topic 1	Topic 2	Comment	Response
316.9	Purpose and Need	Delay	...before Massport creates more and bigger problems with its short term...solutions. As delays have actually been reduced in the last several years, Massport can and should wait before attempting to implement Runway 14/32.	Logan Airport flight delays, as measured by the FAA, did decline between 1993 and 1997. Nevertheless, the same data show that Logan Airport was consistently ranked as one of the nation's most delayed airports throughout this period. In 1998, delayed flights at Logan Airport, as reported by the FAA increased by more than 30 percent, and continued to increase in 2000. In 2000, Logan was the second most delayed airport for arrivals in the US. This represents the worst rank in Logan's history. There are three reasons for the decline in delays between 1993 and 1997. First, in 1997, the number of hourly scheduled flights was less than Logan Airport's normal operating capacity of 120 flights per hour, unlike 1993, when airlines scheduled flights well beyond Logan Airport's hourly capacity. Second, Logan Airport's hourly demand profile is flatter than it was in 1993. Airlines are spreading scheduled flights throughout the day taking advantage of Logan Airport's off-peak hours (*e.g.*, 10 AM to 1 PM). Finally, airlines are carrying more passengers per flight. In fact, with roughly the same number of flights as in 1993, Logan Airport accommodated over 3 million more passengers. One reason for this is that the regional carrier network serving New England is more efficient. In 1993, there were three regional carrier systems serving 2.1 million regional passengers at Logan Airport. Since 1994, Logan Airport has been served by two regional airline systems (Business Express, now American Eagle, and US Airways Express). These carriers handled 2.2 million Logan Airport passengers in 1998. Key lessons learned from this are: 1) while PPP might work in conditions of overscheduling, such as the 1993 environment, because there is no sustained period of flight overscheduling at Logan Airport today, PPP would not provide meaningful delay reduction in the current operating environment; and 2) while delays declined from 1993 to 1997, Logan Airport continued to be one of the most delayed airports in the country because, even though carriers were more efficient at scheduling flights, delays caused by wind and weather continued to occur.
316.10	Alternatives	Runway 14/32	...[The preferred alternative will only reduce the impact over some neighborhoods by 20% initially [and]...there will be increased use of the airport every year, completely eliminating any short term benefits they gain.	Implementation of Runway 14/32 would not result in substantial noise impacts in any community. Rather, it would enable the air traffic controllers to adhere more closely to the PRAS goals and decrease the population that is most severely affected. Refer to Section 6.2.5 of the Supplemental DEIS/FEIR and population counts presented in Tables 6.2-3 through 6.2-8 of the Supplemental DEIS/FEIR.
316.11	Regional Transportation	Regional Airports	...14/32 will instantly permanently harm residents by imposing over "40,000 and growing" more flights over neighborhoods...Boston could offer...[airport] options within its greater metropolitan area. To do this well, there has to be an intermodal transportation plan. Buses and commuter rail have to get people to the various airports along with diverse roadway approaches.	Massport supports improved ground access to Worcester Regional, T.F. Green/Providence, Manchester and Logan airports. These projects are discussed in Section 2.9 of the Supplemental DEIS/FEIR. Since passengers do not travel between New England's regional airports, (*e.g.*, passengers do not first go to Manchester Airport before driving to Logan Airport) it is not clear why improved access between the regional airports would generate any benefit.

LETTER 317

Dear Mr. Pugsley. Today, in Jamaica Plain, There is peace and quiet! There is no Northwest wind - there are also no shrieking planes droning at unacceptable decibel levels overhead constantly - without letup. I didn't purchase my house 14 years ago under a flight path. An earlier (about 2 years ago) EIS decided that fewer people would be affected by the Runway 27 flight path if it moved over a half or mile or so. That decision ruined my peace of mind and my peaceful neighborhood, a neighborhood chosen because it was peaceful. 317.1

I beg you to reject the EIS statement today- Let us all conspire to solve the problem of increased use of Logan, regional options, noise reduction, less pollution, greater safety together. The introduction of the EIS right after the busy year end holidays without greater community discourse on how things might be was grossly unfair. Massport and the FAA have one mindset - how can they operate within their existing regulations. Bring the community in on their discussions and see the perspective broaden instantly. Do not ask for comments. Ask for participatory planning. Let us all take the requisite time to find the best solution. Do not count heads or advertising power. The decision on fairness, equity, parity, delays, no delays - are only a few of the many issues in a comprehensive picture. 317.2

I have a home office and work at my computer all day. I hear every single plane, all day long. Do not pitch the business community - who are not affected by noise in their backyard or their livingrooms and bedrooms - against the residents of affected neighborhoods. An EIS analysis should not be effected by a costly public relations campaign. Be judicious - allow time for more adequate study. Reject the EIS without prejudice. Give us time to work out a reasonable plan. Please.

Barbara Kaplan

Code	Topic 1	Topic 2	Comment	Response
317.1	Noise	Impacts	...in Jamaica Plain, there is peace and quiet, [when] there is no northwest wind [and] there are...no shrieking planes...An earlier (about 2 years ago) EIS decided that fewer people would be affected by the Runway 27 flight path if it moved over a half-mile or so...[ruining] my peaceful neighborhood.	The Supplemental DEIS/FEIR projects that the Preferred Alternative would promote runway use in a manner that is more consistent with annual PRAS goals. The total number of departures from Runway 27 (over South Boston, Roxbury, and Jamaica Plain) would increase, but the number of equivalent jet operations would remain essentially the same. The difference in these communities would be fewer nighttime operations and more daytime operations but the same noise impacts.
317.2	Environmental Review Process	Public Process	The introduction of the EIS right after the busy year end holidays without greater community discourse on how things might be was grossly unfair...[Massport and FAA's] discussions...ask for participatory planning [to develop]...a comprehensive picture.	There was an extensive public participation and review process during the preparation of the Airside Project Draft EIS/EIR. Public comments were received on the ENF after it was filed during the summer of 1995. In the fall of 1995, several public scoping sessions were held to provide community input to the subsequent state and federal scopes for the project. To assure that the Airside analysis was conducted with awareness and input from all concerned parties, the Massport Board established the Airside Review Committee (ARC), which consists of the Community Advisory Committee (with representatives from 24 communities surrounding Logan Airport), and 11 businesses and industry organizations. Massport also funded independent consultants for the CAC to provide them with the capacity to professionally assess the analysis and conclusions of the Airside Study. Between 1995 and 1999, Massport held 16 meetings with the ARC, an additional 15 meetings with just the CAC, and several meetings with the CAC consultants. In addition, Massport made 29 presentations to elected officials, most of whom represent Logan Airport's neighboring communities, and Massport held 45 meetings with community and business leaders, reaching an audience of more than 3,000 people. During the public comment period on the Airside Project Draft EIS/EIR, the FAA held two public hearings. In January 2000, in response to the FAA's review of the Draft EIS, the FAA called for preparation of a Supplemental Draft EIS to address specific issues identified by the FAA following input from a SDEIS Panel consisting of six persons. At the FAA's direction, three SDEIS Panel members were appointed by the Governor of the Commonwealth of Massachusetts and three were appointed by the Mayor of the City of Boston. Under the direction of the New England Region FAA, the SDEIS Panel convened in March of 2000 and then met at least monthly with a final meeting in December of 2000. A total of 12 meetings were held. To provide the appropriate background, the SDEIS Panel was presented with an Interim Supplemental Draft EIS, the Draft EIS/EIR, answers to key letters written by members of the public, concerned agencies and public officials responding to the Draft EIS/EIR, and a series of 15 visual and written presentations from the Project's technical consulting team and other independent industry experts.

LETTER 318

Mitgation is not the answer for increasing flights over neighborhoods by 115%. The answer is to delay building runway 14/32 until other resources are developed and we can measure their impact. A short term solution is forever. If as Massport says, usage will increase anyway, then the 20% improvement will be eliminated with one or two years anyway. I beg you. Ask them to withdraw their EIS or reject it. Whichever works. Do not torture those of us who live under flight paths. Its easy for you who do not bear the burden to dismiss our concerns as unimportant or even worse - worth the sacrifice for the common good. There are better solutions than runway 14/32. Lets examine them before we rush pell mell into disaster. Barbara Kaplan -

Code	Topic 1	Topic 2	Comment	Response
318.1	Alternatives	Other Non-Construction Alternatives	Mitigation is not the answer for increasing flights over neighborhoods by 115%...delay building runway 14/32 until other resources are developed and we can measure their impact.	Unidirectional Runway 14/32 would give the controllers considerably more flexibility and allow them to improve achievement of PRAS goals, and redirect many flights to overwater routes. During very high demand periods, the controllers currently have little or no flexibility for runway selection. The addition of Runway 14/32 would be the single most important mechanism to achieve equitable geographic distribution of aircraft operations. Massport and the FAA are committed to the PRAS system and have been making improvements since 1982.
318.2	Alternatives	Runway 14/32	[Runway 14/32] a short term solution...if...usage will increase anyway, then the 20% improvement will be eliminated with one or two years anyway.	Based on simulation modeling, Logan Airport experienced 120,000 hours of runway-related delays in 1998. If no actions are taken, runway-related delays are forecast to grow as high as 333,000 hours under a 37.5M High Fleet scenario. The Preferred Alternative produces immediate and long-term benefits by lowering runway delays by 38,000 hours if it had been in place in 1998, and by as much as 94,000 hours in the future 37.5M High Fleet scenario. Because of the impact of the regional alternatives, the 37.5M High Fleet scenario is not expected to be achieved until 2015. The sooner airside efficiencies are implemented; the more benefits will accrue over time. Section 4.6 of the Supplemental DEIS/FEIR shows that delay reduction benefits increase over time as traffic levels increase.

COMMENT PROCEDURE for: Draft Logan Airside Improvements (a.k.a. Runway 14/32) **EOEA #10458**

All comments on EIRs (environmental impact report) must refer to the EOEA file number. There may be other identifying numbers, but the EOEA file number is the one which must be used.

Comments not referring to the EOEA file number may not be considered.

Dear Mr. Durand,

My comments to the EIR-Logan Airside Improvements Plan EOEA #10458 are as follows:

I oppose Runway 14/32 EOEA #10458!!
This plan is not a Logan Airside Improvement.
Already there is an unacceptable level of noise in my neighborhood from existing planes overhead. The plan for a new runway would increase the noise threefold. 319.1

UNACCEPTABLE!!

We need another new airport not another runway at Logan. 319.2

319.1	Alternatives	Runway 14/32	Already there is an unacceptable level of noise in my neighborhood from existing planes overhead. The...new runway [Runway 14/32] would increase the noise threefold.	There is no indication that Runway 14/32 would increase the percentage of operations that fly in the vicinity of Jamaica Plain compared to the percentage of operations in the late 1990s. Furthermore, the noisiest airplanes were phased out as of December 31, 1999 and the total noise exposure in Jamaica Plain should be improved.
319.2	Regional Transportation	Regional Airports	We need another new airport not another runway at Logan.	Because the development of a second major airport would require ten to 15 years for site selection and environmental review, in addition to a multi-year construction period, this option is not viewed as a solution to accommodating forecast demand over the next 20 years. Hanscom Field's potential service area overlaps with the service areas for several airports that already have the necessary infrastructure for commercial service. These airports are the Hanscom Field, T.F. Green/Providence, and Worcester Regional, all which have had or are undergoing major improvements to their terminal buildings, other landside facilities and airfields.

COMMENT PROCEDURE for: Draft Logan Airside Improvements (a.k.a. Runway 14/32) **EOEA #10458**

All comments on EIRs (environmental impact report) must refer to the EOEA file number. There may be other identifying numbers, but the EOEA file number is the one which must be used.

Comments not referring to the EOEA file number may not be considered.

LETTER 320

Dear Mr. Durand,

My comments to the EIR-Logan Airside Improvements Plan EOEA #10458 are as follows:

DURING THE 12 YEARS I HAVE LIVED IN JAMAICA PLAIN THE ENVIRONMENTAL NOISE FROM LOGAN HAS BECOME INCREASINGLY INTOLERABLE. WHILE I LOVE BOSTON, IF THINGS GET WORSE — AND THEY WILL IF THIS PLAN GOES THROUGH, I WON'T BE THE ONLY PERSON DRIVEN OUT OF BOSTON). 320.1

THIS STUDY IS SERIOUSLY FLAWED AND MUST BE WITHDRAWN AND RESTUDIED — [redacted] DOING OTHERWISE WILL SERIOUSLY COMPROMISE THE QUALITY OF LIFE IN EASTERN MASSACHUSETTS. 320.2

I'VE ALWAYS BEEN A VOTER, BUT [redacted] IF THIS UNJUST PLAN GOES THROUGH I WILL BECOME ONE OF MANY WHO BECOME POLITICAL ACTIVISTS.

MASSPORT CONTINUES TO MISREPRESENT THE SEVERITY OF THE ENVIRONMENTAL IMPACT IN ORDER TO MANIPULATE PUBLIC OPINION AND THE POLITICAL PROCESS. HOWEVER, THE RESIDENTS (AND VOTERS) LIVE WITH THE DAILY REALITIES — PLEASE DO ALL YOU CAN TO KEEP MASSPORT FROM DESTROYING OUR ENVIRONMENT AND THE LIVABILITY OF OUR NEIGHBORHOODS.

SINCERELY,

LETTER 322

19 Roseway St.
Jamaica Plain, MA 02130
March 15, 1999

MA Environmental Affairs Office
100 Cambridge St.
Boston, MA

To Whom It May Concern,

I am writing in reference to Massport's Report #10458, Logan Airside Improvements Planning Project Draft Environmental Impact Statement/Report. While this document is extensive and covers major areas of concern to Boston residents, it falls short of truly describing environmental impacts of Runway 14/32.

Building Runway 14/32 will allow Massport to increase the number of flights per hour. Clearly every flight adds to air pollution, particularly for East Boston residents. To suggest that the air pollution will be negligible is irresponsible. In fact, the levels may continue to be under EPA's maximum standards, but over time they are clearly affecting residents health. Massport has not done its homework to show that it takes the health problems of its neighbors seriously. 322.1

The building of Runway 14/32 will triple operations over several Boston neighborhoods. The South End, Roxbury, and Jamaica Plain will see a staggering increase in flights, from 18,000 a year to 56,000 a year. The statistics represented in the report leave out the number of people affected in these areas. Two years after settling on a route which would affect the smallest number of people, the majority of flights off Runway 27 are still flying over densely populated areas of Jamaica Plain and Roxbury. By its own admission, only 35% of airplanes are flying the route that would affect the smallest number of people. Therefore, when using Runway 27, the majority of Massport's flights are in violation of the legal proceding's settlement. Instead of offering to make other concessions since it is unable to conform to the guidelines of the settlement, Massport is now proposing to triple operations over these neighborhoods. Allowing this makes no sense. Furthermore, there is no plan for noise abatement in these neighborhoods. Again, Massport downplays the effect on these residents' health. Interrupted sleep leads takes its toll on the immune system. Certainly Massport makes no effort to look at the combined effect of a 300% increase in noise pollution with the environmental health risks from diesel fumes and other contaminants, particularly in asthma ridden communities like Egleston Square. 322.2 322.3 322.4 322.5

Massport's current plan is a stop-gap solution. The draft report offers no long-term plan for growth after 2010. Continued expansion at Logan imposes a serious health risks on residents of Boston. Massport must present other options besides not building or expanding operations at Logan. The report is incomplete without serious consideration of Massport's other facility: the Hanscom airfield. At a recent city council hearing, Massport employees testified that the percentage of Boston residents who use Logan is under 25% of its total passenger load. To continue to impose all of the environmental burden on the inner city when the majority of its users are from outside the city lines is inequitable. Before any construction begins, we need a long-term strategy that is truly an equitable sharing of the pollution burden. 322.6 322.7

Sincerely,

Myra N. Love

Code	Topic 1	Topic 2	Comment	Response
322.1	Alternatives	Runway 14/32	...[The] Logan Airside Improvements Planning Project Draft Environmental Impact Statement/Report...falls short of truly describing environmental impacts of runway 14/32. Building Runway 14/32 will allow Massport to increase the number of flights per hour [adding]...to air pollution, particularly for East Boston residents...the levels may continue to be under EPA's maximum standards, but...they are clearly affecting residents health.	The Preferred Alternative, and specifically unidirectional Runway 14/32, would not increase Logan Airport's normal airfield capacity of approximately 120 operations per hour. This capacity is available at Logan Airport approximately 80 percent of the time. Runway 14/32 would allow Logan Airport to maintain this capacity during periods of strong northwest winds that now require controllers to operate on only one or two runways, compared to the typical three-runway configurations used at Logan Airport. The runway will not increase Logan Airport's normal operating capacity, nor will it encourage or induce an increase in aircraft operations.
322.2	Alternatives	Runway 14/32	The building of Runway 14/32 will triple operations over several Boston neighborhoods...from 18,000 a year to 56,000 a year.	Refer to Section 8.2 of the Supplemental DEIS/FEIR, which clearly states that Option C is the preferred layout for Runway 14/32 and that Option C requires determination of acceptable level of safety. Refer to Section 8.2 of the Supplemental DEIS/FEIR, which clearly states that Option C is the preferred layout for Runway 14/32 and that Option C requires determination of acceptable level of safety. There is no indication that Runway 14/32 would increase the percentage of operations that fly in the vicinity of Jamaica Plain compared to the percentage of operations in the late 1990s. Furthermore, the noisiest airplanes were phased out as of December 31, 1999 and the total noise exposure in Jamaica Plain should be improved. The goals of the Airside Project are to reduce delay, increase the airport's efficiency, and improve airfield safety in an environmentally responsible manner. Unidirectional Runway 14/32 would also give the controllers considerably more flexibility and allow them to improve achievement of PRAS goals, and redirect many flights to overwater routes. During very high demand periods, the controllers currently have little or no flexibility for runway selection. The addition of Runway 14/32 would be the single most important mechanism to achieve equitable geographic distribution of aircraft operations. Massport and the FAA are committed to the PRAS system and have been making improvements since 1982.
322.3	Alternatives	Runway 14/32	Two years later settling on a route which would affect the smallest number of people, the majority of flights off Runway 27 are still flying over densely populated areas of Jamaica Plain and Roxbury. By its own admission, only 35% of airplanes are flying the route that would affect the smallest number of people. Therefore, when using Runway 27, the majority of Massport's flights are in violation of the legal proceeding's settlement....since it is unable to conform to the guidelines of the settlement, Massport is now proposing to triple operations over three neighborhoods.	The Supplemental DEIS/FEIR projects that the Preferred Alternative would promote runway use in a manner that is more consistent with annual PRAS goals. The total number of departures from Runway 27 (over South Boston, Roxbury, and Jamaica Plain) would increase, but the number of equivalent jet operations would remain essentially the same. The difference in these communities would be fewer nighttime operations and more daytime operations but the same noise impacts.

Code	Topic 1	Topic 2	Comment	Response
322.4	Noise	Impacts	...there is no plan for noise abatement in...[the affected] neighborhoods.	Logan Airport has one of the most comprehensive and progressive sound insulation programs of any airport in the country. It was initiated in 1980 before any airport began receiving federal funding to soundproof homes under FAR Part 150. It is the only program in the country to offer residents extra sound insulation treatment in a "room of preference" chosen by the homeowner and it is the only program in the country attempting to receive FAA approval to expand the area of eligibility by accounting for hill effects. In addition, as of the 1999–2000 construction season, FAA grants covering 80 percent of the cost of sound insulation (paid for by airline ticket taxes), combined with funds provided by Massport through Passenger Facility Charges and landing fees, had fully funded the sound insulation of all eligible dwelling units in Massport's current sound insulation program. Despite this accomplishment, Massport continues to seek means of expanding its sound insulation program exclusive of FAA's decision on this Supplemental DEIS/FEIR. If the FAA approves the Preferred Alternative, Massport is committed to expanding the program to include all additionally eligible residences.
322.5	Public Health	Effects	...Massport makes no effort to look at the combined effect of a 300% increase in noise pollution with the environmental health risks from diesel fumes and other contaminants, particularly in asthma ridden communities like Egleston Square.	The available public health studies for communities adjacent to Logan Airport were reviewed and are presented in Section 6.8 of the Supplemental DEIS/FEIR. Public health status reports were available for the City of Boston; however, comparable public health reports were not available from the Public Health Departments of Chelsea, Revere, and Winthrop. A review of the available information did not indicate any causal relationship based on proximity to the airport, nor did it identify hearing loss as a public health concern. The 1999 Massachusetts budget included $150,000 to fund an environmental assessment of the health impacts of Logan Airport on any community located within a five-mile radius of the airport. The final protocol for the study is being developed. The study is expected to be completed in summer 2002.
322.6	Alternatives	Preferred Alternative	Massport's current plan is a stop-gap solution. The draft report offers no long-term plan for growth after 2010.	Based on simulation modeling, Logan Airport experienced 120,000 hours of runway-related delays in 1998. If no actions are taken, runway-related delays are forecast to grow as high as 333,000 hours under a 37.5M High Fleet scenario. The Preferred Alternative produces immediate and long-term benefits by lowering runway delays by 38,000 hours if it had been in place in 1998, and by as much as 94,000 hours in the future 37.5M High Fleet scenario. Because of the impact of the regional alternatives, the 37.5M High Fleet scenario is not expected to be achieved until 2015. The sooner airside efficiencies are implemented; the more benefits will accrue over time. Section 4.6 of the Supplemental DEIS/FEIR shows that delay reduction benefits increase over time as traffic levels increase.

Code	Topic 1	Topic 2	Comment	Response
322.7	Regional Transportation	Regional Airports	Massport must present other options besides not building or expanding operations at Logan. The report is incomplete without serious consideration of Massport's other facility: the Hanscom airfield. Massport employees testified that the percentage of Boston residents who use Logan is under 25% of its total passenger load. To continue to impose all of the environmental burden on the inner city when the majority of its users are from outside the city lines is inequitable...we need a long-term strategy that is truly an equitable sharing of the pollution burden.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR specifically considered the role of Hanscom Field in the analysis of regional alternatives. Hanscom Field, which serves as a general aviation reliever airport to Logan Airport, already accommodates a significant number of aircraft operations (183,000 operations in 1998). The Hanscom Field activity includes private, business, charter, and air taxi operations that might otherwise use Logan Airport. Since the Airside Project Draft EIS/EIR was filed, Shuttle America, a newly founded airline, began commercial scheduled operations at Hanscom Field, offering limited turboprop services to short-haul regional markets – Trenton, Buffalo, Hartford (discontinued), Wilmington, Delaware (discontinued), and Greensboro. Shuttle America is also conducting operations between Hanscom and New York LaGuardia Airport. While Massport supports commercial service at Hanscom Field consistent with its established policy (60-seat regulation), it believes that Hanscom Field will maintain its role as a major general aviation reliever, and that its geographic proximity to Logan, Worcester Regional and Manchester airports will prevent its development as a significant commercial airport. Additionally, commuter airlines serving Logan Airport are unlikely to move a significant number of flights from Logan Airport to Hanscom Field, since approximately 50 percent of passengers on Logan Airport's commuter flights connect to other Logan Airport flights. However, any new commercial service initiatives proposed for Hanscom Field shall be reviewed for consistency with the *Hanscom GEIR* (HGEIR), its Annual Updates, and applicable regulatory limitations, and shall be considered by the Hanscom Field Advisory Committee. Refer to Section 2.6 of the Supplemental DEIS/FEIR for a discussion of Hanscom Field. The environmental impacts of commercial services at Hanscom Field are summarized from the HGEIR and appear in Appendix B of the Supplemental DEIS/FEIR.

Comments to: Draft Logan Airside Improvements EOEA #10458

COMMENT PROCEDURE for: Draft Logan Airside Improvements (a.k.a. Runway 14/32) **EOEA #10458**

All comments on EIRs (environmental impact report) must refer to the EOEA file number. There may be other identifying numbers, but the EOEA file number is the one which must be used.

LETTER 323

Comments not referring to the EOEA file number may not be considered.

All comments must be received April 22, 1999
All mail concerning the environmental impact review process including filings, comments, and all associated materials must be addressed to:

Bob Durand, Secretary
Executive Office of Environmental Affairs
Attention: MEPA Office
Arthur Pugsley EOEA No. **#10458**
100 Cambridge Street - 20th Floor
Boston, MA 02202

Failure to address mail in this manner may result in delay of action on comments or no action on comments at all.

Dear Mr. Durand,

My comments to the EIR-Logan Airside Improvements Plan EOEA #10458 are as follows:

323.1
323.2 The study does not address cumulative impact of airside changes on ground transportation.
"Over the Water" routes also impact Dorchester, South Boston
323.3 Milton Quincy etc.
323.4 Does not take into account disruption of new Opera House
The most important "benefit" the lessening of delays,
323.5 is completely negated within 10 years.
No examination was made of alternative airfields,
323.6 not even Hanscom, which is owned by Massport
Delay figures are not supported by standard methods
323.7 of computing delays.
The report assumes that increasing departures off R27
from 18,000 to 56,000 annually represents no
significant impact.

Code	Topic 1	Topic 2	Comment	Response
323.1	Ground Transportation	Access to Logan	The study does not address cumulative impact of airside changes on ground transportation.	The Preferred Alternative is not expected to lead to an increase in passenger demand, and therefore, it will have no effect on congestion or delays on Boston area highways.
323.2	Alternatives	Runway 14/32	"Over the water" routes also impact Dorchester, South Boston, Milton, Quincy, etc.	The analysis in the Airside Project Draft EIS/EIR and Supplemental DEIS/FEIR shows that, because PPP eliminates a small number of small aircraft operations, it does not produce any environmental benefits or impacts. The potential impact of PPP on the fleet mix at Logan Airport is discussed in Section 4.5.2 of the Supplemental DEIS/FEIR.
323.3	Land Use	Land Use Compatability	Does not take into account disruption of new Opera House.	Implementation of Runway 14/32 would not result in substantial noise impacts in any community. Rather, it would enable the air traffic controllers to adhere more closely to the PRAS goals and decrease the population that is most severely affected. Refer to Section 6.2.5 of the Supplemental DEIS/FEIR and population counts presented in Tables 6.2-3 through 6.2-8 of the Supplemental DEIS/FEIR.
323.4	Alternatives	Preferred Alternative	The most important "benefit" the lessening of delays, is completely negated within 10 years.	Based on simulation modeling, Logan Airport experienced 120,000 hours of runway-related delays in 1998. If no actions are taken, runway-related delays are forecast to grow as high as 333,000 hours under a 37.5M High Fleet scenario. The Preferred Alternative produces immediate and long-term benefits by lowering runway delays by 38,000 hours if it had been in place in 1998, and by as much as 94,000 hours in the future 37.5M High Fleet scenario. Because of the impact of the regional alternatives, the 37.5M High Fleet scenario is not expected to be achieved until 2015. The sooner airside efficiencies are implemented; the more benefits will accrue over time. Section 4.6 of the Supplemental DEIS/FEIR shows that delay reduction benefits increase over time as traffic levels increase.

Code	Topic 1	Topic 2	Comment	Response
323.5	Regional Transportation	Regional Airports	No examination was made of alternative airfields, not even Hanscom, which is owned by Massport.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR, specifically considered the role of Hanscom Field in the analysis of regional alternatives. Hanscom Field, which serves as a general aviation reliever airport to Logan Airport, already accommodates a significant number of aircraft operations (183,000 operations in 1998). The Hanscom Field activity includes private, business, charter, and air taxi operations that might otherwise use Logan Airport. Since the Airside Project Draft EIS/EIR was filed, Shuttle America, a newly founded airline, began commercial scheduled operations at Hanscom Field, offering limited turboprop services to short-haul regional markets – Trenton, Buffalo, Hartford (discontinued), Wilmington, Delaware (discontinued), and Greensboro. Shuttle America is also conducting operations between Hanscom and New York LaGuardia Airport. While Massport supports commercial service at Hanscom Field consistent with its established limits (60 seat regulation), Massport believes that Hanscom Field will maintain its role as a major general aviation reliever, and that its geographic proximity to Logan, Worcester Regional and Manchester airports will prevent its development as a significant commercial airport. Additionally, commuter airlines serving Logan Airport are unlikely to move a significant number of flights from Logan Airport to Hanscom Field, since approximately 50 percent of passengers on Logan Airport's commuter flights connect to other Logan Airport flights and a significant number of passengers are travelling to Boston. However, any new commercial service initiatives proposed for Hanscom Field shall be reviewed for consistency with the *Hanscom GEIR* (HGEIR) and its Annual Updates, and shall be considered by the Hanscom Area Town Selectmen (HATS). Refer to Section 2.6 of the Supplemental DEIS/FEIR for a discussion of Hanscom Field.
323.6	Analytical Assumptions/ Methodologies	Delay Model	Delay figures are not supported by standard methods of computing delays.	Refer to Section 4.4 of the Supplemental DEIS/FEIR for a discussion on the estimation and modeling of flight delays. It includes a description of FAA and U.S. DOT delay measures and their limitations, an explanation of computer models for estimating flight delays, and historical data on delays at Logan Airport and other major United States airports. The methodology used for the Airside Project includes the effects of constraints at Logan Airport, and produces lower delay estimates than FAA modeling. The FAA approved all the models, which have been validated in previously published studies of Logan Airport.
323.7	Alternatives	Preferred Alternative	The report assumes that increasing departures off Route 27 from 18,000 to 56,000 annually represents no significant impact.	The goals of the Airside Project are to reduce delay, increase the airport's efficiency, and improve airfield safety in an environmentally responsible manner. Unidirectional Runway 14/32 would also give the controllers considerably more flexibility and allow them to improve achievement of PRAS goals, and redirect many flights to overwater routes. During very high demand periods, the controllers currently have little or no flexibility for runway selection. The addition of Runway 14/32 would be the single most important mechanism to achieve equitable geographic distribution of aircraft operations. Massport and the FAA are committed to the PRAS system and have been making improvements since 1982. The goals of the Airside Project are to reduce delay, increase the airport's efficiency, and improve airfield safety in an environmentally responsible manner. Unidirectional Runway 14/32 would also give the controllers considerably more flexibility and allow them to improve achievement of PRAS goals, and redirect many flights to overwater routes. During very high demand periods, the controllers currently have little or no flexibility for runway selection. The addition of Runway 14/32 would be the single most important mechanism to achieve equitable geographic distribution of aircraft operations. Massport and the FAA are committed to the PRAS system and have been making improvements since 1982.

LETTER 324

April 20, 1999

Dear Mr. Pugsley:

We are writing to express our strong opposition to Runway 14/32 and to any further development at Logan Airport. We need amelioration of how bad things already are, not further development. The quality of life in our neighborhood is very bad now because of airplane noise. We pray that one of the fine alternatives to Logan expansion be employed.

324.1

324.2

With appreciation,

Sincerely,

Joseph M. Nucci

Marilyn J. Nucci

324.1	Alternatives	Runway 14/32	We...express our strong opposition to Runway 14/32 and to any further development at Logan Airport. The quality of life in our neighborhood is very bad now because of airplane noise.	The Supplemental DEIS/FEIR projects that the Preferred Alternative would promote runway use in a manner that is more consistent with annual PRAS goals. The total number of departures from Runway 27 (over South Boston, Roxbury, and Jamaica Plain) would increase, but the number of equivalent jet operations would remain essentially the same. The difference in these communities would be fewer nighttime operations and more daytime operations but the same noise impacts.
324.2	Alternatives	Other Non-Construction Alternatives	...one of the five alternatives to Logan expansion [should] be employed.	Comment noted.

19 Roseway St.
Jamaica Plain, MA 02130
March 13, 1999

LETTER 325

MA Environmental Affairs Office
100 Cambridge St.
Boston, MA

To Whom It May Concern,

I am submitting my comments in reference to Massport's Report #10458, Logan Airside Improvements Planning Project Draft Environmental Impact Statement/Report. I hope that you will halt Massport's plans because this report does not address several important points adequately.

The building of Runway 14/32 will triple operations over several Boston neighborhoods. The statistics represented in the report gloss over the number of people affected in various areas. The breakdowns are not adequate to assess the real impact on populations according to neighborhood. Clearly peace and health are hard to tag with a price. Many people will pay for this project through property devaluation and stress levels. To overlook these environmental impacts is a serious deficiency of the report. 325.1

Further, the draft report offers no long-term plan for growth after 2010. Although not guaranteed, there is certainly the possibility of continued growth. Continuing to expand Logan imposes a burden on inner-city residents of Boston. The report is incomplete without serious consideration of Massport's other facility: the Hanscom airfield. 325.2 325.3 325.4

Many of Boston's residents have worked long and hard to preserve green space in the city. Runway 14/32 will negatively impact the green spaces in the Emerald Necklace and it seems that it will also have a severe impact on the new Boston Harbor Islands National Park. This report does nothing to assess the environmental impact on such green spaces, their animal residents, or their potential use by city residents. Airplane noise already diminishes the quality of the experience of Franklin Park Zoo, the golf course and picnic areas. The impact on these valuable public spaces is not addressed. 325.5

I hope you will find that Massport's Draft Plan is in no way a comprehensive look at the true repercussions of the proposed Runway 14/32. Before any construction begins, we need a long-term strategy that is truly an equitable sharing of the pollution burden.

Sincerely,

Martha Merson

Martha Merson

325.1	Alternatives	Runway 14/32	The building of Runway 14/32 will triple operations over several Boston neighborhoods. The statistics...gloss over the number of people affected ...The breakdowns are not adequate to assess the real impact on populations according to neighborhood...through property devaluation and stress levels.	Tables 6.2-3 through 6.2-5 and Table 6.2.21 in the Supplemental DEIS/FEIR show the noise impacted population in each community.
325.2	Analysis Assumptions/ Methodologies	Planning Period	...the draft report offers no long-term plan for growth after 2010.	Based on simulation modeling, Logan Airport experienced 120,000 hours of runway-related delays in 1998. If no actions are taken, runway-related delays are forecast to grow as high as 333,000 hours under a 37.5M High Fleet scenario. The Preferred Alternative produces immediate and long-term benefits by lowering runway delays by 38,000 hours if it had been in place in 1998, and by as much as 94,000 hours in the future 37.5M High Fleet scenario. Because of the impact of the regional alternatives, the 37.5M High Fleet scenario is not expected to be achieved until 2015. The sooner airside efficiencies are implemented; the more benefits will accrue over time. Section 4.6 of the Supplemental DEIS/FEIR shows that delay reduction benefits increase over time as traffic levels increase.
325.3	Environmental Justice	Impacts	Continuing to expand Logan imposes a burden on inner-city residents of Boston.	Refer to Section 6.8 of the Supplemental DEIS/FEIR for a discussion of the Environmental Justice analysis. Low-income and minority populations were defined in accordance with Federal Executive Order 12898, the Final United States Department of Transportation Order, and the Council on Environmental Quality's guidance on environmental justice. In addition, the analysis of low-income populations was expanded to include households at 150 percent of poverty level. This analysis found that there is no high and adverse disproportionate impact to low-income and minority populations caused by the Preferred Alternative.

Code	Topic 1	Topic 2	Comment	Response
325.4	Regional Transportation	Regional Airports	The report is incomplete without serious consideration of Massport's other facility: the Hanscom airfield.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR, specifically considered the role of Hanscom Field in the analysis of regional alternatives. Hanscom Field, which serves as a general aviation reliever airport to Logan Airport, already accommodates a significant number of aircraft operations (183,000 operations in 1998). The Hanscom Field activity includes private, business, charter, and air taxi operations that might otherwise use Logan Airport. Since the Airside Project Draft EIS/EIR was filed, Shuttle America, a newly founded airline, began commercial scheduled operations at Hanscom Field, offering limited turboprop services to short-haul regional markets – Trenton, Buffalo, Hartford (discontinued), Wilmington, Delaware (discontinued), and Greensboro. Shuttle America is also conducting operations between Hanscom and New York LaGuardia Airport. While Massport supports commercial service at Hanscom Field consistent with its established limits (60 seat regulation), Massport believes that Hanscom Field will maintain its role as a major general aviation reliever, and that its geographic proximity to Logan, Worcester Regional and Manchester airports will prevent its development as a significant commercial airport. Additionally, commuter airlines serving Logan Airport are unlikely to move a significant number of flights from Logan Airport to Hanscom Field, since approximately 50 percent of passengers on Logan Airport's commuter flights connect to other Logan Airport flights and a significant number of passengers are travelling to Boston. However, any new commercial service initiatives proposed for Hanscom Field shall be reviewed for consistency with the *Hanscom GEIR* (HGEIR) and its Annual Updates, and shall be considered by the Hanscom Area Town Selectmen (HATS). Refer to Section 2.6 of the Supplemental DEIS/FEIR for a discussion of Hanscom Field.
325.5	Open Space/ Parkland	Impacts	Runway 14/32 will negatively impact the green spaces in the Emerald Necklace and it ...will also have a severe impact on the new Boston Harbor Islands National Park. This report does nothing to assess the environmental impact on such green spaces, their animal residents, or their potential use by city residents. Airplane noise already diminishes the quality of the experience of Franklin Park Zoo, the golf course and picnic areas.	The Supplemental DEIS/FEIR contains additional analysis of the project relative to parklands. As depicted in Figure 6.3-4 of the Supplemental DEIS/FEIR, the Arnold Arboretum, Emerald Necklace, and Franklin Park are well outside the 65 dB DNL noise contour associated with the Preferred Alternative. Therefore, the Airside Project will have no impact on these parklands. In addition, the Boston Harbor Islands, while within the No Action Alternative 65 dB DNL noise contour, will have no noise increase under the Preferred Alternative. Refer to Section 6.3 of the Supplemental DEIS/FEIR for additional discussion of parklands. The Supplemental DEIS/FEIR contains additional analysis of the project relative to parklands. As depicted in Figure 6.3-4 of the Supplemental DEIS/FEIR, the Arnold Arboretum, Emerald Necklace, and Franklin Park are well outside the 65 dB DNL noise contour associated with the Preferred Alternative. Therefore, the Airside Project will have no impact on these parklands. In addition, the Boston Harbor Islands, while within the No Action Alternative 65 dB DNL noise contour, will have no noise increase under the Preferred Alternative. Refer to Section 6.3 of the Supplemental DEIS/FEIR for additional discussion of parklands.

LETTER 326

April 5, 1999

Secretary of Environmental Affairs
Attention MEPA Office
Mr. Arthur Pugsley-EOEA No. 10458
100 Cambridge Street
20th Floor
Boston, MA 02205

Dear Mr. Pugsley,

I am writing to let you and your colleagues know that I do not support the Logan Modernization project, including the construction of runway 14/32. I do support a greater emphasis on regional alternatives, such as high speed rail and the expanded use of other Massachusetts airports. 326.1

Jobs as a result of the proposed expansion and delay problems at Logan are overstated and do not outweigh the quality of life issues that will adversely be effected by the expansion of Logan; issues that ultimately determine where we locate our businesses and where we live. 326.2

Noise, air pollution, and congested roadways resulting from increased traffic in and out of Logan Airport are of great concern to me. 326.3

Expanding our airports and roadways are a short-term answer to a problem that needs long term solutions. Help those of us against the construction of runway 14/32 and the expansion of Logan Airport keep Boston a city in which people choose to not only conduct business, but choose to live. 326.4

Sincerely,

Laura Orlando

Code	Topic 1	Topic 2	Comment	Response
326.1	Regional Transportation	Regional Airports	I am writing to let you and your colleagues know that I do not support the Logan Modernization project, including the construction of runway 14/32. I do support a greater emphasis on regional alternatives, such as high speed rail and the expanded use of other Massachusetts airports.	The alternative analysis conforms to FAA and MEPA scoping directives. The impact of the regional alternatives has been addressed through the study of a range of forecast activity levels. Refer to Chapter 2 of the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR for a comprehensive discussion of regional alternatives. Massport advocates increased use of the regional airports and high-speed rail services, in addition to construction of Runway 14/32 and the other airside improvement projects at Logan Airport, as a comprehensive plan for ensuring an efficient and balanced regional transportation system. As the analysis in Chapter 2 of this Supplemental DEIS/FEIR indicates, these off-airport alternatives are expected to reduce aircraft traffic growth pressures at Logan Airport, but they will not eliminate airside delays at Logan Airport that occur because of a third operating runway during periods of northwest winds. The Preferred Alternative, which specifically addresses this deficiency, is necessary and provides clear benefits at current aircraft traffic levels. These benefits will only increase in the future, even as developments at the regional airports and high-speed rail to New York act to reduce the rate of future growth at Logan Airport.
326.2	Purpose and Need	Delay	Jobs as a result of the proposed expansion and delay problems at Logan are overstated and do not outweigh the quality of life issues that will adversely be effected [sic]....	Section 1.3 of the Supplemental DEIS/FEIR discusses the importance of Logan Airport to the regional economy.
326.3	Noise	Impacts	Noise, air pollution, and congested roadways resulting from increased traffic in and out of Logan Airport are of great concern to me.	Comment noted.
326.4	Regional Transportation	Regional Airports	Expanding our airports and roadways are a short-term answer....	Based on simulation modeling, Logan Airport experienced 120,000 hours of runway-related delays in 1998. If no actions are taken, runway-related delays are forecast to grow as high as 333,000 hours under a 37.5M High Fleet scenario. The Preferred Alternative produces immediate and long-term benefits by lowering runway delays by 38,000 hours if it had been in place in 1998, and by as much as 94,000 hours in the future 37.5M High Fleet scenario. Because of the impact of the regional alternatives, the 37.5M High Fleet scenario is not expected to be achieved until 2015. The sooner airside efficiencies are implemented; the more benefits will accrue over time. Section 4.6 of the Supplemental DEIS/FEIR shows that delay reduction benefits increase over time as traffic levels increase. Implementation of the Preferred Alternative would not increase capacity, but rather it would correct a series of deficiencies in the airfield geometry and operation. Massport's plans to handle the ground access requirements of future passenger levels are discussed in the *Logan Airport 1999 ESPR* (previously GEIR) and its subsequent Environmental Data Reports (Annual Updates).

April 9, 1999

LETTER 327

John Rodman
Assistant State Environmental Affairs Secretary
100 Cambridge Street, Fl. 20
Boston, MA 02202

Dear Mr. Rodman,

Please accept my written testimony on the subject of the proposed runway 14/32 at Logan Airport.

Yesterday, when I got off the orange line at Green Street in Jamaica Plain, I sat outside on a bench directly over the train tracks reading in the balmy air for a few minutes. As a train approached I expected a deafening noise. But the orange line was surprisingly quiet, drowned out by a jet that simultaneously roared overhead. I was amazed to find that a train travelling so close to me was not nearly as loud as a jet that was thousands of feet away.

After that I went for a walk in the Arnold Arboretum at dusk. Spring is just beginning to creep in and I lay on my back looking up into towering cedar trees. The Arnold Arboretum is an amazing gem for Boston. You can walk for hours, and there are places where you can genuinely feel far away from a city. I was hoping to "call in" an owl, and a ranger once showed me where and how I may have some luck. I listened to the other birds heading to roost for the night as nocturnal creatures started to creep out. Unfortunately, my experience was marred by the flights taking off from Runway 27. Plane after plane roared overhead and muffled the sounds of nature.

One characteristic of Boston that everyone is aware of is its premium on space. However, the Emerald Necklace is an impressive preservation of open space, and provides refuge to hundreds of thousands of citizens who rely on this tranquility amid the din of everyday city life. It is also a huge draw for visitors, and characterizes the civility and heart of Boston. 327.1

Discouraged, I went home. I live in a modest apartment in an invaluably diverse community in Jamaica Plain, the Parkside neighborhood. I chose to settle here and buy a condominium at the end of a dead-end street one year ago. My backyard abuts a gorgeous wooded section of Franklin Park. We can sit on our back porch and glimpse an endangered peregrine falcon or a red-tailed hawk, bats in the summer, an occasional dog walking with its owner in the park. Our neighborhood is truly serene.

Last night, I lay in bed at 11:35pm. As flights using Runway 27 zoomed overhead I could not sleep. Certainly these planes are violating Boston city ordinances on noise levels. They are so loud that my bed vibrates as they fly over. I am astounded by how intrusive they are, and most importantly, I live nowhere near Logan Airport. When we are walking in the park, or grilling on the back porch, and sometimes even inside our home, we have to halt our conversation as the planes fly over. 327.2

This morning I was awakened by more jets at 6:05, a scant 6 ½ hours since I was lying awake feeling the planes. Today I am exhausted and bleary-eyed. Now I am told that the noise pollution that I am faced with several days every week will triple if the new runway is built. What a shame to ruin some of Boston's last remaining open space.

Emily A. Peckham

Emily Peckham, Jamaica Plain

327.1	Open Space/ Parkland	Impacts	...my experience [at the Arnold Arboretum yesterday] was marred by the flights taking off from Runway 27. Plane after plane roared overhead and muffled the sounds of nature...the Emerald Necklace is an impressive preservation of open space....	The Supplemental DEIS/FEIR contains additional analysis of the project relative to parklands. As depicted in Figure 6.3-4 of the Supplemental DEIS/FEIR, the Arnold Arboretum, Emerald Necklace, and Franklin Park are well outside the 65 dB DNL noise contour associated with the Preferred Alternative. Therefore, the Airside Project will have no impact on these parklands. In addition, the Boston Harbor Islands, while within the No Action Alternative 65 dB DNL noise contour, will have no noise increase under the Preferred Alternative. Refer to Section 6.3 of the Supplemental DEIS/FEIR for additional discussion of parklands.
327.2	Noise	Runway Use	As flights using Runway 27 zoomed overhead [at 11:25 pm last night] I could not sleep. Certainly these planes are violating Boston city ordinances on noise levels. I am astounded by how intrusive [flights using Runway 27] are. ...I am told that the noise pollution that I am faced with several days every week will triple if the new runway [Runway 14/32] is built.	Refer to Section 8.2 of the Supplemental DEIS/FEIR, which clearly states that Option C is the preferred layout for Runway 14/32 and that Option C requires determination of acceptable level of safety. There is no indication that Runway 14/32 would increase the percentage of operations that fly in the vicinity of Jamaica Plain compared to the percentage of operations in the late 1990s. Furthermore, the noisiest airplanes were phased out as of December 31, 1999 and the total noise exposure in Jamaica Plain should be improved.

Dear Mr. Durand,

My comments to the EIR-Logan Airside Improvements Plan EOEA #10458 are as follows:

- This plan does not take into account the massive increase in surface traffic that will be caused by the increased flights. 329.1
- The plan as written is seriously flawed in its counting of passenger delays. It is also self-serving for the Massport authority 329.2
- ~~is flawed~~ The plan is much too short-term where a long term, regional approach that considers all transport modalities is needed 329.3 329.4

Code	Topic 1	Topic 2	Comment	Response
329.1	Ground Transportation	Access to Logan	This plan does not take into account the massive increases in surface traffic that will be caused by the increased flights.	The Preferred Alternative is not expected to lead to an increase in passenger demand, and therefore, it will have no effect on congestion or delays on Boston area highways. Refer to Section 4.2.
329.2	Delay	Model	The plan as written is seriously flawed in its counting of present delays.	Refer to Section 4.4 of the Supplemental DEIS/FEIR for a discussion on the estimation and modeling of flight delays. It includes a description of FAA and U.S. DOT delay measures and their limitations, an explanation of computer models for estimating flight delays, and historical data on delays at Logan Airport and other major United States airports. The methodology used for the Airside Project includes the effects of constraints at Logan Airport, and produces lower delay estimates than FAA modeling. The FAA approved all the models, which have been validated in previously published studies of Logan Airport.
329.3	Alternatives	Preferred Alternative	The plan is much too short-term....	Based on simulation modeling, Logan Airport experienced 120,000 hours of runway-related delays in 1998. If no actions are taken, runway-related delays are forecast to grow as high as 333,000 hours under a 37.5M High Fleet scenario. The Preferred Alternative produces immediate and long-term benefits by lowering runway delays by 38,000 hours if it had been in place in 1998, and by as much as 94,000 hours in the future 37.5M High Fleet scenario. Because of the impact of the regional alternatives, the 37.5M High Fleet scenario is not expected to be achieved until 2015. The sooner airside efficiencies are implemented; the more benefits will accrue over time. Section 4.6 of the Supplemental DEIS/FEIR shows that delay reduction benefits increase over time as traffic levels increase.
329.4	Regional Transportation	Regional Airports	...a long term regional approach that considers alt. transport modalities is needed.	The alternative analysis conforms to FAA and MEPA scoping directives. The impact of the regional alternatives has been addressed through the study of a range of forecast activity levels. Refer to Chapter 2 of the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR for a comprehensive discussion of regional alternatives. Massport advocates increased use of the regional airports and high-speed rail services, in addition to construction of Runway 14/32 and the other airside improvement projects at Logan Airport, as a comprehensive plan for ensuring an efficient and balanced regional transportation system. As the analysis in Chapter 2 of this Supplemental DEIS/FEIR indicates, these off-airport alternatives are expected to reduce aircraft traffic growth pressures at Logan Airport, but they will not eliminate airside delays at Logan Airport that occur because of a third operating runway during periods of northwest winds. The Preferred Alternative, which specifically addresses this deficiency, is necessary and provides clear benefits at current aircraft traffic levels. These benefits will only increase in the future, even as developments at the regional airports and high-speed rail to New York act to reduce the rate of future growth at Logan Airport.

Boston, MA 02202

Failure to address mail in this manner may result in delay of action on comments or no action on comments at all.

Dear Mr. Durand,

My comments to the EIR-Logan Airside Improvements Plan EOEA #10458 are as follows:

1. This will increase not decrease air traffic over Jamaica Plain in the long and short term. 330.1
2. It will not solve the long-term issues regarding increased air traffic at Logan Airport. 330.2
3. The DEIS/DEIR for the Logan Airside Improvements Planning Project is basically flawed in its calculation of present delays and future impact. 330.3
4. There is no plan to handle the massive increases in ground traffic that will be a direct result of the increased passenger flights. 330.4

Code	Topic 1	Topic 2	Comment	Response
330.1	Alternatives	Runway 14/32	This will increase not decrease air traffic over Jamaica Plain....	The Supplemental DEIS/FEIR projects that the Preferred Alternative would promote runway use in a manner that is more consistent with annual PRAS goals. The total number of departures from Runway 27 (over South Boston, Roxbury, and Jamaica Plain) would increase, but the number of equivalent jet operations would remain essentially the same. The difference in these communities would be fewer nighttime operations and more daytime operations but the same noise impacts.
330.2	Alternatives	Preferred Alternative	It will not solve the long-term issues regarding increased air traffic at Logan Airport.	Based on simulation modeling, Logan Airport experienced 120,000 hours of runway-related delays in 1998. If no actions are taken, runway-related delays are forecast to grow as high as 333,000 hours under a 37.5M High Fleet scenario. The Preferred Alternative produces immediate and long-term benefits by lowering runway delays by 38,000 hours if it had been in place in 1998, and by as much as 94,000 hours in the future 37.5M High Fleet scenario. Because of the impact of the regional alternatives, the 37.5M High Fleet scenario is not expected to be achieved until 2015. The sooner airside efficiencies are implemented; the more benefits will accrue over time. Section 4.6 of the Supplemental DEIS/FEIR shows that delay reduction benefits increase over time as traffic levels increase.
330.3	Delay	Models	The DEIS/DEIR for the Logan Airside Improvements Planning Project is basically flawed in its calculation of present delays and future impact.	Refer to Section 4.4 of the Supplemental DEIS/FEIR for a discussion on the estimation and modeling of flight delays. It includes a description of FAA and U.S. DOT delay measures and their limitations, an explanation of computer models for estimating flight delays, and historical data on delays at Logan Airport and other major United States airports. The methodology used for the Airside Project includes the effects of constraints at Logan Airport, and produces lower delay estimates than FAA modeling. The FAA approved all the models, which have been validated in previously published studies of Logan Airport.
330.4	Ground Transportation	Access to Logan	There is no plan to handle the massive increases in ground traffic....	The Preferred Alternative is not expected to lead to an increase in passenger demand, and therefore, it will have no effect on congestion or delays on Boston area highways. Refer to Section 4.2.

COMMENT PROCEDURE for: Draft Logan Airside Improvements (a.k.a. Runway 14/32) **EOEA #10458**

All comments on EIRs (environmental impact report) must refer to the EOEA file number. There may be other identifying numbers, but the EOEA file number is the one which must be used.

Comments not referring to the EOEA file number may not be considered.

Dear Mr. Durand,

My comments to the EIR-Logan Airside Improvements Plan EOEA #10458 are as follows:

I am completely against the construction of a new runway. In Jamaica Plain where I live we are only now feeling some relief from the barrage of airplane noise. That would keep us indoors in good weather. Developing more air business at local airports (with commuter shuttles) would be the answer - for now at least. 331.1 331.2

Code	Topic 1	Topic 2	Comment	Response
331.1	Alternatives	Impacts	I am completely against the construction of a new runway. In Jamaica Plain...The barrage of airplane noise...keeps us indoors in good weather.	The Supplemental DEIS/FEIR projects that the Preferred Alternative would promote runway use in a manner that is more consistent with annual PRAS goals. The total number of departures from Runway 27 (over South Boston, Roxbury, and Jamaica Plain) would increase, but the number of equivalent jet operations would remain essentially the same. The difference in these communities would be fewer nighttime operations and more daytime operations but the same noise impacts.
331.2	Regional Transportation	Regional Airports	Developing more air business at local airports (with commuter shuttles) would be the answer....	The alternative analysis conforms to FAA and MEPA scoping directives. The impact of the regional alternatives has been addressed through the study of a range of forecast activity levels. Refer to Chapter 2 of the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR for a comprehensive discussion of regional alternatives. Massport advocates increased use of the regional airports and high-speed rail services, in addition to construction of Runway 14/32 and the other airside improvement projects at Logan Airport, as a comprehensive plan for ensuring an efficient and balanced regional transportation system. As the analysis in Chapter 2 of this Supplemental DEIS/FEIR indicates, these off-airport alternatives are expected to reduce aircraft traffic growth pressures at Logan Airport, but they will not eliminate airside delays at Logan Airport that occur because of a third operating runway during periods of northwest winds. The Preferred Alternative, which specifically addresses this deficiency, is necessary and provides clear benefits at current aircraft traffic levels. These benefits will only increase in the future, even as developments at the regional airports and high-speed rail to New York act to reduce the rate of future growth at Logan Airport.

Comments to: Draft Logan Airside Improvements EOEA #10458

332.1	Nose	Runway 14/32	The new runway proposed is NO solution...no one will tolerate living in a city where outdoor life will be intolerable.	Massport's FAA-approved sound insulation program is only one element of the noise abatement program. For a discussion of the noise abatement program, refer to the discussion in the *Logan Airport 1994/1995 GEIR* and the *Logan Airport 1998 Annual Update*. Massport has existing actions initiatives underway that reduce noise impacts on nearby communities, including: Noise abatement and runway use restrictions; Exploring means of extending the Logan Airport sound insulation program through innovative investigation of hill effects on sound propagation; Encouraging growth at Worcester Regional Airport and other alternative airports; and Monitoring and improving achievement of PRAS goals.

LETTER 333

24 Cranston St.
Jamaica Plain, MA 02130
April 15, 1999

Bob Durand, Secretary
Executive Office of Environmental Affairs
100 Cambridge Street - 20th Floor,
Boston, MA 02202

Dear Mr. Durand:

I am writing to share my position on Massport's proposed new runway 14/32 with you. I am adamantly opposed to the proposed runway, and I encourage the Executive Office of Environmental Affairs to study the issue closely and stand opposed to Massport's proposal as well.

Yes, Boston needs a healthy transportation system, and an airport plays an important role. However, air travel is the most environmentally damaging way to travel, in terms of fuel consumption per person, noise and air quality degradation, and economics. 333.1

Massport argues that the runway is needed to cut delays, but even this is in dispute, depending on who is interpreting which statistics. More importantly, like the rule for highways, "build it and they will come", a new runway will lead to more flights, more noise, more pollution. Though the runway might have a specific direction and a pledge for restricted use, like HOV lanes nationwide, the restrictions are always eased as the number of users overall continually climbs. The number of flights in and out of Logan will increase to the capacity of the structure. Thus, no new structures. 333.2 333.3

Furthermore, there is an element of environmental justice to the debate. The impacted areas are home to the bulk of metropolitan Boston's poor, minority, colored communities. Meanwhile, the majority of those who fly frequently are wealthier and more likely to live in the suburbs, out of harms way. 333.4

Sane, sustainable transportation policy needs to be build on cutting trips, decreasing noise, fuel consumption, and air pollution. That means focusing on rail travel for long distances. The State of Massachusetts, Massport, and other political entities need to deal with alternative forms of transportation before they increase capacity at an airport, build a new highway, etc. 333.5

For all these reasons, the Executive Office of Environmental Affairs should stand against any airport expansion.

Sincerely,

David Weinstein

333.1	Alternatives	Runway 14/32	I am adamantly opposed to the proposed runway [14/32]....	Comment noted.
333.2	Purpose and Need	Delay	Massport argues that the runway is needed to cut delays, but even this is in dispute, depending on who is interpreting which statistics.	Refer to Section 4.4 of the Supplemental DEIS/FEIR for a discussion on the estimation and modeling of flight delays. It includes a description of FAA and U.S. DOT delay measures and their limitations, an explanation of computer models for estimating flight delays, and historical data on delays at Logan Airport and other major United States airports. The methodology used for the Airside Project includes the effects of constraints at Logan Airport, and produces lower delay estimates than FAA modeling. The FAA approved all the models, which have been validated in previously published studies of Logan Airport. The FAA Technical Center was responsible for the capacity and delay results in the 1992 FAA Capacity Enhancement Report for Logan Airport that concluded the need for Runway 14/32, reduced minimums and taxiway improvements. The Technical Center simulated Logan Airport airfield operations with the RDSIM model and estimated that when activity reached 504,000 annual operations, total delay would exceed 260,000 hours per year. The Airside Project Draft EIS/EIR forecasts delays to increase to 157,500 hours per year when annual operations reach 510,000 with the 29M Low Fleet scenario. The Supplemental DEIS/FEIR compares the FAA Technical Center delay estimates in 1992 with those of the Logan Airside Project estimates. The FAA has concluded that the Airside delays represent "a plausible and conservative estimate...." The FAA consistently rates Logan Airport as one of the most delay prone airports in the United States Logan Airport's estimated annual delay hours are over five times the FAA's 20,000-hour threshold for a severely delayed airport. Refer to Section 4.4 of the Supplemental DEIS/FEIR for a discussion on the estimation and modeling of flight delays. It includes a description of FAA and U.S. DOT delay measures and their limitations, an explanation of computer models for estimating flight delays, and historical data on delays at Logan Airport and other major United States airports. The methodology used for the Airside Project includes the effects of constraints at Logan Airport, and produces lower delay estimates than FAA modeling. The FAA approved all the models, which have been validated in previously published studies of Logan Airport.
333.3	Alternatives	Runway 14/32	...a new runway will lead to more flights, more noise, more pollution. Though the runway might have a specific direction and a pledge for restricted use...restrictions are always eased as the number of users overall continually climbs. The number of flights in and out of Logan will increase to the capacity of the structure.	The goals of the Airside Project are to reduce delay, increase the airport's efficiency, and improve airfield safety in an environmentally responsible manner. The construction of unidirectional Runway 14/32 would prevent the significant drop in airfield capacity that now occurs during northwest wind conditions. The runway would not increase Logan Airport's normal operating capacity of approximately 120 operations per hour which is available nearly 80 percent of the year, but rather would allow this capacity to be maintained more consistently. The new runway at Logan Airport is not proposed to increase the annual capacity at Logan Airport. Rather, it is proposed to reduce delays, particularly on days with strong northwest winds. The Airside Project Draft EIS/EIR analysis shows that this runway also provides more flexibility in runway use, allowing the FAA controllers to adhere more closely to the PRAS goals with attendant benefits to the neighboring communities that are most highly noise impacted.

Code	Topic 1	Topic 2	Comment	Response
333.4	Environmental Justice	Impacts	...there is an element of environmental justice...The impacted areas are home to the bulk of metropolitan Boston's poor, minority, colored communities...the majority of those who fly frequently are wealthier and more likely to live in the suburbs, out of harms way.	The Environmental Justice analysis was expanded for the Supplemental DEIS/FEIR. Low-income and minority populations were defined in accordance with Federal Executive Order 12898, the Final United States Department of Transportation Order, and the Council on Environmental Quality's guidance on environmental justice. In addition, the analysis of low-income populations was expanded to include households at 150 percent of poverty level. This analysis found that there is no high and adverse disproportionate impact to low-income and minority populations caused by the Preferred Alternative. Adverse impacts are not predominately borne by low-income or minority populations. Only 21 percent of the population within the 65 dB DNL contour for the Preferred Alternative is minority, compared to the Suffolk County minority population of 38 percent. Less than two percent of the population within the 65 dB DNL contour for the Preferred Alternative has a household income less than 150 percent of poverty level. The additional area within the 65 dB DNL noise contour associated with the Preferred Alternative includes a predominately Hispanic neighborhood in Chelsea which is predicted under worst case assumptions to experience an increase of 0.6 dB or less. Under FAA standards, this change is not a significant adverse impact. The minority and low-income populations in South Boston and East Boston affected by the Preferred Alternative 65 dB DNL contour are almost identical to the No Action Alternative. The 65 dB DNL contour for the Preferred Alternative does not extend into Jamaica Plain, Roxbury and the South End. Mitigation of the increased noise within the 65 dB DNL contour will be provided to affected communities in the form of residential sound insulation. A discussion of the Environmental Justice analysis is presented in Section 6.8 of Supplemental DEIS/FEIR.
333.5	Regional Transportation	Regional Airports	The State of Massachusetts, Massport, and other political entities need to deal with alternative forms of transportation [e.g., rail travel] before they increase capacity at an airport....	The alternative analysis conforms to FAA and MEPA scoping directives. The impact of the regional alternatives has been addressed through the study of a range of forecast activity levels. Refer to Chapter 2 of the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR for a comprehensive discussion of regional alternatives. Massport advocates increased use of the regional airports and high-speed rail services, in addition to construction of Runway 14/32 and the other airside improvement projects at Logan Airport, as a comprehensive plan for ensuring an efficient and balanced regional transportation system. As the analysis in Chapter 2 of this Supplemental DEIS/FEIR indicates, these off-airport alternatives are expected to reduce aircraft traffic growth pressures at Logan Airport, but they will not eliminate airside delays at Logan Airport that occur because of a third operating runway during periods of northwest winds. The Preferred Alternative, which specifically addresses this deficiency, is necessary and provides clear benefits at current aircraft traffic levels. These benefits will only increase in the future, even as developments at the regional airports and high-speed rail to New York act to reduce the rate of future growth at Logan Airport.

Dear Mr. Durand,

NO NEW RUNWAY, BECAUSE . . .

My comments to the EIR-Logan Airside Improvements Plan EOEA #10458 are as follows:

1) a new runway may (according to Massport or community) relieve delays, but only for a few years. "Build it and they will come." Roads, runways. More capacity means more flights, more air pollution, noise pollution, auto traffic to and from the airport. 334.1 334.2

2) Massport has not yet studied / implemented peak pricing which is proven to decrease traffic + delays at certain times. 334.3

3) The State needs to explore alternatives & GIVE THEM A CHANCE – like high speed rail, expanded rail. Our society spends billions on highways and air travel, but demands cuts and/or no subsidies from Amtrack + the MBTA. 334.4

4) More air travel equals more gas & oil dependency, wars, oil spills, etc.

334.1	Alternatives	Runway 14/32	A new runway may...relieve delays, but only for a few years.	Based on simulation modeling, Logan Airport experienced 120,000 hours of runway-related delays in 1998. If no actions are taken, runway-related delays are forecast to grow as high as 333,000 hours under a 37.5M High Fleet scenario. The Preferred Alternative produces immediate and long-term benefits by lowering runway delays by 38,000 hours if it had been in place in 1998, and by as much as 94,000 hours in the future 37.5M High Fleet scenario. Because of the impact of the regional alternatives, the 37.5M High Fleet scenario is not expected to be achieved until 2015. The sooner airside efficiencies are implemented; the more benefits will accrue over time. Section 4.6 of the Supplemental DEIS/FEIR shows that delay reduction benefits increase over time as traffic levels increase.
334.2	Alternatives	Runway 14/32	More capacity means more flights, more air pollution, noise pollution, auto traffic to and from the airport.	The Preferred Alternative is not expected to lead to an increase in passenger demand, and therefore, it will have no effect on congestion or delays on Boston area highways. Refer to Section 4.2.
334.3	Alternatives	Peak Period Pricing	Massport has not yet studied/implemented peak pricing, which is proven to decrease traffic and delays at certain times.	Section 4.5 of the Supplemental DEIS/FEIR provides an updated discussion of PPP at Logan Airport and an analysis of the implications of an illustrative conceptual small community exemption program. PPP was included among the Airside Project alternatives to address delays caused by over-scheduling. The potential impact of PPP on the fleet mix at Logan Airport is discussed in Section 4.5.2 of the Supplemental DEIS/FEIR. Section 4.5.3 of the Supplemental DEIS/FEIR provides an analysis of a PPP Exemption program.
334.4	Regional Transportation	Passenger Rail	...explore alternatives...like high speed rail....	The alternative analysis conforms to FAA and MEPA scoping directives. The impact of the regional alternatives has been addressed through the study of a range of forecast activity levels. Refer to Chapter 2 of the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR for a comprehensive discussion of regional alternatives. Massport advocates increased use of the regional airports and high-speed rail services, in addition to construction of Runway 14/32 and the other airside improvement projects at Logan Airport, as a comprehensive plan for ensuring an efficient and balanced regional transportation system. As the analysis in Chapter 2 of this Supplemental DEIS/FEIR indicates, these off-airport alternatives are expected to reduce aircraft traffic growth pressures at Logan Airport, but they will not eliminate airside delays at Logan Airport that occur because of a third operating runway during periods of northwest winds. The Preferred Alternative, which specifically addresses this deficiency, is necessary and provides clear benefits at current aircraft traffic levels. These benefits will only increase in the future, even as developments at the regional airports and high-speed rail to New York act to reduce the rate of future growth at Logan Airport.

Dear Mr. Durand,

My comments to the EIR-Logan Airside Improvements Plan EOEA #10458 are as follows:

335.1 THERE ARE ENOUGH FLAWS IN MASSPORT'S ENVIRONMENTAL IMPACT STUDY TO INVALIDATE THEIR PROPOSAL FOR RUNWAY 14/32. FOR INSTANCE:

- THE DELAY FIGURES FOR LOGAN AIRPORT AS PRESENTED BY MASSPORT ARE GROSSLY EXAGGERATED, OUTDATED AND BASED ON "MAXIMUM CAPACITY" GOALS.

335.2 SINCE 1992, DELAYS AT LOGAN HAVE ACTUALLY GONE DOWN, ACCORDING TO THE FA

- MASSPORT'S "NOISE CONTOUR LINES" HAVE NOT BEEN UPDATED TO REFLECT THE ACTU

335.3 NOISE LEVELS SUFFERED BY BOSTON COMMUNITIES. THEIR NOISE MEASURING METHOD ARE HIGHLY FANCIFUL.

335.4

- MASSPORT'S CONCEPT OF "EQUITABLE SHARE OF THE NOISE" PUTS THE BURDEN ON LOW-INCOME, INNER CITY NEIGHBORHOODS WHILE SPARING THE AFFLUENT SUBURBS: HANSCOM AIRPORT, WHICH COULD RELIEVE LOGAN, IS ONLY USED AT A THIRD OF

335.5 ITS CAPACITY.

- THE ENVIRONMENTAL IMPACT REPORT DOES NOT TAKE INTO ACCOUNT THE CUMULATI IMPACT OF THE PROPOSAL, NAMELY THE DISASTROUS EFFECTS THE RESULTING

335.6 INCREASE IN AIR TRAFFIC WILL HAVE ON GROUND TRANSPORTATION, AIR QUALIT HEALTH, QUALITY OF LIFE, REAL ESTATE PRICES, MUNICIPAL TAX REVENUES.

335.7 THIS PROPOSAL HAS VERY LITTLE TO DO WITH DELAY REDUCTION, AND EVERYTHING TO DO WITH EXPANSION OF CAPACITY AT LOGAN, UNTIL SATURATION IS REACHED AGAIN A FEW YEARS DOWN THE LINE. THE PRICE PAID BY BOSTON RESIDENTS IS ALREADY TOO HIGH. WHAT WE NEED ARE SENSIBLE LONG-SIGHTED ALTERNATIVES.

Code	Topic 1	Topic 2	Comment	Response
335.1	Delay	Model	The delay figures [in support of runway 14/32]...are grossly exaggerated, outdated and based on "maximum capacity" goals. Since 1992, delays at Logan have actually gone down, according to the FAA.	Logan Airport flight delays, as measured by the FAA, did decline between 1993 and 1997. Nevertheless, the same data show that Logan Airport was consistently ranked as one of the nation's most delayed airports throughout this period. In 1998, delayed flights at Logan Airport, as reported by the FAA increased by more than 30 percent, and continued to increase in 2000. In 2000, Logan was the second most delayed airport for arrivals in the US. This represents the worst rank in Logan's history. There are three reasons for the decline in delays between 1993 and 1997. First, in 1997, the number of hourly scheduled flights was less than Logan Airport's normal operating capacity of 120 flights per hour, unlike 1993, when airlines scheduled flights well beyond Logan Airport's hourly capacity. Second, Logan Airport's hourly demand profile is flatter than it was in 1993. Airlines are spreading scheduled flights throughout the day taking advantage of Logan Airport's off-peak hours (*e.g.*, 10 AM to 1 PM). Finally, airlines are carrying more passengers per flight. In fact, with roughly the same number of flights as in 1993, Logan Airport accommodated over 3 million more passengers. One reason for this is that the regional carrier network serving New England is more efficient. In 1993, there were three regional carrier systems serving 2.1 million regional passengers at Logan Airport. Since 1994, Logan Airport has been served by two regional airline systems (Business Express, now American Eagle, and US Airways Express). These carriers handled 2.2 million Logan Airport passengers in 1998. Key lessons learned from this are: 1) while PPP might work in conditions of overscheduling, such as the 1993 environment, because there is no sustained period of flight overscheduling at Logan Airport today, PPP would not provide meaningful delay reduction in the current operating environment; and 2) while delays declined from 1993 to 1997, Logan Airport continued to be one of the most delayed airports in the country because, even though carriers were more efficient at scheduling flights, delays caused by wind and weather continued to occur. In response to the request made by the EPA, as well as by EOEA in its MEPA Certificate on the Draft EIR, the Supplemental DEIS/FEIR includes delay and environmental analyses for 1998 to reflect current conditions and to provide context to the delay problem at Logan Airport. However, it should be noted that the appropriate comparison for assessing future year conditions and the effectiveness of the Airside Project, is a comparison of the Preferred Alternative to the No Action Alternative, not a comparison of the Preferred Alternative to the base year. A discussion of current and historic conditions can be found in Section 4.2 of the Supplemental DEIS/FEIR. Refer to Section 4.4 of the Supplemental DEIS/FEIR for a discussion on the estimation and modeling of flight delays. It includes a description of FAA and U.S. DOT delay measures and their limitations, an explanation of computer models for estimating flight delays, and historical data on delays at Logan Airport and other major United States airports. The methodology used for the Airside Project includes the effects of constraints at Logan Airport, and produces lower delay estimates than FAA modeling. The FAA approved all the models, which have been validated in previously published studies of Logan Airport.

Code	Topic 1	Topic 2	Comment	Response
335.2	Noise	Impacts	Massport's "noise contour lines" have not been updated to reflect the actual noise levels suffered by Boston communities. Their noise measuring methods are highly fanciful.	The dispersion model portion of the LDMS is an EPA-approved model. The methodology is consistent with FAA and EPA guidelines. Differences between measured and modeled sound levels have been reported in Logan Airport's various GEIRs and Annual Updates for a number of years. Differences at close-in locations were significantly reduced in 1996 through modification of source levels to better account for over-water sound propagation and apparent use of higher engine power settings than are normally assumed in the noise model's database (Refer to Appendix F of the *Logan Airport 1996 Annual Update).* In 1998, differences between measured and modeled noise became even less when Massport upgraded its monitoring system and began to report noise caused only by aircraft -- a metric directly comparable to the DNL exposure levels predicted by the noise model. At sites having exposure levels of 60 dB or more, this improvement to the monitoring system brought measured and modeled DNL values to within 0.2 dB of each other. (Refer to Chapter 6 of the *Logan Airport 1999 Environmental Planning and Status Report*). Massport continues to investigate possible causes for remaining differences (such as from hill effects) but believes the FAA's INM noise model used in the Airside Project noise analyses accurately represents expected noise exposure.
335.3	Noise	Impacts	Massport's concept of "equitable share of the noise" puts the burden on low-income, inner city neighborhoods [with runway 14/32]....	The Environmental Justice analysis in Section 6.8 was expanded for the Supplemental DEIS/FEIR. Low-income and minority populations were defined in accordance with Federal Executive Order 12898, the Final United States Department of Transportation Order, and the Council on Environmental Quality's guidance on environmental justice. In addition, the analysis of low-income populations was expanded to include households at 150 percent of poverty level. This analysis found that there is no high and adverse disproportionate impact to low-income and minority populations caused by the Preferred Alternative. Adverse impacts are not predominately borne by low-income or minority populations. Only 21 percent of the population within the 65 dB DNL contour for the Preferred Alternative is minority, compared to the Suffolk County minority population of 38 percent. Less than two percent of the population within the 65 dB DNL contour for the Preferred Alternative has a household income less than 150 percent of poverty level. The additional area within the 65 dB DNL noise contour associated with the Preferred Alternative includes a predominately Hispanic neighborhood in Chelsea which is predicted under worst case assumptions to experience an increase of 0.6 dB or less. Under FAA standards, this change is not a significant adverse impact. The minority and low-income populations in South Boston and East Boston affected by the Preferred Alternative 65 dB DNL contour are almost identical to the No Action Alternative. The 65 dB DNL contour for the Preferred Alternative does not extend into Jamaica Plain, Roxbury and the South End. Mitigation of the increased noise within the 65 dB DNL contour will be provided to affected communities in the form of residential sound insulation.

Code	Topic 1	Topic 2	Comment	Response
335.4	Regional Airports		...Hanscom airport, which could relieve Logan, is only used at a third of its capacity.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR, specifically considered the role of Hanscom Field in the analysis of regional alternatives. Hanscom Field, which serves as a general aviation reliever airport to Logan Airport, already accommodates a significant number of aircraft operations (183,000 operations in 1998). The Hanscom Field activity includes private, business, charter, and air taxi operations that might otherwise use Logan Airport. Since the Airside Project Draft EIS/EIR was filed, Shuttle America, a newly founded airline, began commercial scheduled operations at Hanscom Field, offering limited turboprop services to short-haul regional markets – Trenton, Buffalo, Hartford (discontinued), Wilmington, Delaware (discontinued), and Greensboro. Shuttle America is also conducting operations between Hanscom and New York LaGuardia Airport. While Massport supports commercial service at Hanscom Field consistent with its established limits (60 seat regulation), Massport believes that Hanscom Field will maintain its role as a major general aviation reliever, and that its geographic proximity to Logan, Worcester Regional and Manchester airports will prevent its development as a significant commercial airport. Additionally, commuter airlines serving Logan Airport are unlikely to move a significant number of flights from Logan Airport to Hanscom Field, since approximately 50 percent of passengers on Logan Airport's commuter flights connect to other Logan Airport flights and a significant number of passengers are travelling to Boston. However, any new commercial service initiatives proposed for Hanscom Field shall be reviewed for consistency with the *Hanscom GEIR* (HGEIR) and its Annual Updates, and shall be considered by the Hanscom Area Town Selectmen (HATS). Refer to Section 2.6 of the Supplemental DEIS/FEIR for a discussion of Hanscom Field.
335.5	Public Health	Effects	The Environmental Impact Report does not take into account the cumulative impact...the increase in air traffic [from runway 14/32] will have on ground transportation, air quality, health, quality of life, real estate prices, municipal tax revenues.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR analyze the environmental impacts of the Airside Project, consistent with established federal and state scoping directives. Appropriate mitigation associated with the Airside Project has also been established. Massport has programs in place to reduce the environmental impacts associated with Logan Airport as a whole. These initiatives are described in the *Logan Airport ESPR* and its updates.
335.6	Alternatives	Runway 14/32	...[Runway 14/32] has very little to do with delay reduction, and everything to do with expansion of capacity.	The Preferred Alternative, and specifically unidirectional Runway 14/32, would not increase Logan Airport's normal airfield capacity of approximately 120 operations per hour. This capacity is available at Logan Airport approximately 80 percent of the time. Runway 14/32 would allow Logan Airport to maintain this capacity during periods of strong northwest winds that now require controllers to operate on only one or two runways, compared to the typical three-runway configurations used at Logan Airport. The runway will not increase Logan Airport's normal operating capacity, nor will it encourage or induce an increase in aircraft operations.
335.7	Alternatives	Runway 14/32	...saturation ...[will be] reached again a few years....	Based on simulation modeling, Logan Airport experienced 120,000 hours of runway-related delays in 1998. If no actions are taken, runway-related delays are forecast to grow as high as 333,000 hours under a 37.5M High Fleet scenario. The Preferred Alternative produces immediate and long-term benefits by lowering runway delays by 38,000 hours if it had been in place in 1998, and by as much as 94,000 hours in the future 37.5M High Fleet scenario. Because of the impact of the regional alternatives, the 37.5M High Fleet scenario is not expected to be achieved until 2015. The sooner airside efficiencies are implemented; the more benefits will accrue over time. Section 4.6 of the Supplemental DEIS/FEIR shows that delay reduction benefits increase over time as traffic levels increase.

Comments to: Draft Logan Airside Improvements EOEA #10458

COMMENT PROCEDURE for: Draft Logan Airside Improvements (a.k.a. Runway 14/32) **EOEA #10458**

All comments on EIRs (environmental impact report) must refer to the EOEA file number. There may be other identifying numbers, but the EOEA file number is the one which must be used.

Comments not referring to the EOEA file number may not be considered.

LETTER 336

All comments must be received April 22, 1999
All mail concerning the environmental impact review process including filings, comments, and all associated materials must be addressed to:

Bob Durand, Secretary
Executive Office of Environmental Affairs
Attention: MEPA Office
Arthur Pugsley EOEA No. **#10458**
100 Cambridge Street - 20th Floor
Boston, MA 02202

Failure to address mail in this manner may result in delay of action on comments or no action on comments at all.

Dear Mr. Durand,

My comments to the EIR-Logan Airside Improvements Plan EOEA #10458 are as follows:

This is not the long term solution, nor is it environmentally WISE. ALL MAJOR CITIES WITH AN AIRPORT CLOSE TO THE CITY HAS ALREADY HAD TO REACH OUT TO THEIR SUBERS TO ACCOMODATE GROWTH. THIS IS THE TIME TO START THAT PROCESS NOT USE THIS BANDAID TO THEN STRAIGHT BE BACK TO THE SAME PLACE. I WOULD HOPE THAT OUR POLITICAL LEADERS COULD SEE THAT. 336.1

Code	Topic 1	Topic 2	Comment	Response
336.1	Alternatives	Preferred Alternative	This is not a long-term solution...This is the time to start...[the] process [of reaching out to the suburbs to accommodate growth]....	Because the development of a second major airport would require ten to 15 years for site selection and environmental review, in addition to a multi-year construction period, this option is not viewed as a solution to accommodating forecast demand over the next 20 years. Hanscom Field's potential service area overlaps with the service areas for several airports that already have the necessary infrastructure for commercial service. These airports are the Hanscom Field, T.F. Green/Providence, and Worcester Regional, all which have had or are undergoing major improvements to their terminal buildings, other landside facilities and airfields.

LETTER 337

April 2, 1999

Secretary of Environmental Affairs
Attention: MEPA Office
Mr. Arthur Pugsley, EOEA 10458
100 Cambridge St, 20th Floor
Boston, MA 02202

Dear Mr. Pugsley:

I am writing to comment on EOEA 10458, Logan Airside Improvements Planning Project. **I am writing in support of the proposed project** which involves a new runway and added taxiways at Logan International Airport for the following reasons: 337.1

- Since the option of no action involves significant adverse environmental impact, particularly from increased noise and increased air traffic delays, this project will serve to manage and reduce noise pollution and will also have some benefit from an air pollution standpoint. 337.2
- The project will improve the safety of the airport particularly in times of high air traffic congestion with high winds. I use the airport about 12 to 20 times per year and this is important to me – especially during severe winter storms. The project is especially designed for higher wind conditions. 337.3
- The project is vital to the economy of Greater Boston since substantial air traffic delays will make travel here less economically attractive. This is particularly important due to the new Boston Convention Center being built.
- The concerns of neighbors do not recognize the fact that a majority of them moved into the area since the airport's use as an international airport and they knew what they were moving into. Many of them have government funded sound proofing in their homes. 337.4
- Alternatives involving other airport(s) may take decades to work out. We cannot wait that long because the impacts on safety and the economy are affecting the Greater Boston community now. 337.5
- Other environmental impacts appear to be minimal.

I appreciate your consideration of my views.

Sincerely,

Richard Jordan

To: Mr. Arthur Pugsley and
Mr. Robert Durand, Sec. of MEPA Unit.
From: Jill Richard, 291 High Street, Medford, MA 02155
Re: Air Traffic/New Runway Reference File #10458E08
Date: April 21, 1999

I am opposed to Massport's Proposal to build a new Runway (14.32)as it will triple the departures through Medford via runway 1533 at Logan Airport. This would be intolerable. It is a quality of life issue. The whole Western part of the state could use a runway in their backyards. It would provide convenience for them, auto traffic congestion is not a factor there, parking would be viable and air traffic would be spread across the state. There is absolutely no sane rationale for adding to the traffic and environmental concerns by adding another runway in the Greater Boston area. Anyone who legitmately cares about the environment is aware of this. Thank You for your attention to this matter.

Code	Topic 1	Topic 2	Comment	Response
338.1	Alternatives	Runway 14/32	...[The] new Runway (14/32)...will triple the departures through Medford via runway 15/33 at Logan Airport. This would be intolerable.	The Supplemental DEIS/FEIR projects that the Preferred Alternative promote runway use in a manner that is more consistent with annual PRAS goals, and Medford is affected most by Runway 33 departures and Runway 15 arrivals. Total departures from Runway 33L and arrivals to Runway 15R would increase, but many of these are non-jets. These runway operating directions are currently running well below their PRAS goals, and the unidirectional Runway 14/32 would allow the controllers to approach but still remain below the annual goals for these operations. The PRAS goals were established based on a thorough public participation process in response to community noise concerns. Additionally, by increasing the number of operations over water, Runway 14/32 would reduce the total annual hours of dwell and persistence over populated areas in accordance with short-term PRAS goals.
338.2	Regional Transportation	Regional Airports	The whole western part of the state could use a runway in their backyards. It would provide convenience for them, auto traffic congestion is not a factor there, parking would be viable and air traffic would be spread across the state.	Since January 2000 Massport has attracted three new airlines to Worcester Regional Airport. Delta Connection began serving Worcester Regional Airport with two daily nonstop roundtrip flights on regional jet aircraft to Atlanta on February 1, 2000 and will be increasing its service to three daily flights in April 2001. On July 6, 2000, American Eagle began service to New York JFK Airport with three daily nonstop roundtrip flights on turboprop aircraft. In February 2001, PanAm began daily scheduled service from Worcester to Orlando International Airport. Massport is in ongoing discussions with other carriers regarding potential new services at Worcester Regional Airport. In addition to the Worcester Regional Airport, Massport has pursued a variety of initiatives to promote the use of other regional airports and travel modes with the goal of relieving traffic growth pressures at Logan Airport. For example, in November 1999, Massport and Governor Cellucci co-sponsored a Regional Transportation Summit of the New England Governors and transportation officials. The Summit focused on joint marketing among the New England commercial service airports and the joint promotion of rail and road initiatives that will foster an efficient and balanced regional transportation system. A second summit was held in Rhode Island in December 2000. Refer to Chapter 2 of the Supplemental DEIS/FEIR for a comprehensive discussion of Massport's regional transportation planning initiatives. Massport disagrees that its record in diverting traffic to other airports is unsuccessful. Since 1996 eight out of ten new passengers in New England were directed to regional airports, which include T.F. Green/Providence, Worcester Regional, and Manchester airports. In 1999, Massport estimates that regional airports attracted 2.4 million passengers, that would have otherwise used Logan Airport.

LETTER 339

From the Desk of Maryann P. Mahony.....

MEPA
State Transportation Building
10 Park Plaza
Boston, MA

RE: Logan Runway 1432
Massachusetts Environmental Policy Act Hearing

To Whom It May Concern:

My name is Maryann P. Mahony. I live at 18 Hummock Road in North Quincy. I am unable to attend tonight's meeting but I would like to be recorded in opposition of Runway 1432. I have lived in Quincy for many years with the current level of service not being sufficient and with the increased noise and pollution. Adding an additional runway would only increase these problems, therefore I strongly suggest you reconsider the Logan Runway expansion. 339.1
]

I feel the Worcester Airport or Hanscan Field would be more appropriate for the expansion. I also feel strongly that more public input is needed from the residence of Quincy and I believe that is important for Massport to hold a community meeting before any decisions are made. I believe these are quality of life issues that will have a major impact on North Quincy, Marina Bay, and Squantum residence. 339.2 339.3

Sincerely,

Maryann Mahony

Code	Topic 1	Topic 2	Comment	Response
339.1	Alternatives	Runway 14/32	...I would like to be recorded in opposition of Runway 14/32. I have lived in Quincy for many years with the current level of service not being sufficient and with the increased noise and pollution...an additional runway would only increase these problems....	In 1998, 77 percent of Logan Airport's jet traffic affected communities to the north and south of the airport—East Boston, Winthrop, Revere, parts of South Boston, Dorchester, Quincy, Milton, and Braintree. Without Runway 14/32, as much as 88 percent of Logan Airport's aircraft operations will overfly these communities when Logan Airport reaches 37.5 million passengers. Construction of Runway 14/32 will allow a more balanced geographic distribution of aircraft operations over populated areas, will increase the number of over-water operations, and will reduce noise exposure for close-in communities. In fact, the most heavily impacted communities will experience a decrease in overflights compared to 1998 levels. With the Preferred Alternative, when Logan Airport reaches 29 million passengers, overflights from Runway 4 arrivals and Runway 22 departures, which affect South Boston, Quincy, Milton, and Braintree, will decrease from 107,861 in 1998 to 58,305 operations.
339.2	Regional Transportation	Regional Airports	...the Worcester Airport or Hanscom Field would be more appropriate for the expansion.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR, specifically considered the role of Hanscom Field in the analysis of regional alternatives. Hanscom Field, which serves as a general aviation reliever airport to Logan Airport, already accommodates a significant number of aircraft operations (183,000 operations in 1998). The Hanscom Field activity includes private, business, charter, and air taxi operations that might otherwise use Logan Airport. Since the Airside Project Draft EIS/EIR was filed, Shuttle America, a newly founded airline, began commercial scheduled operations at Hanscom Field, offering limited turboprop services to short-haul regional markets – Trenton, Buffalo, Hartford (discontinued), Wilmington, Delaware (discontinued), and Greensboro. Shuttle America is also conducting operations between Hanscom and New York LaGuardia Airport. While Massport supports commercial service at Hanscom Field consistent with its established limits (60 seat regulation), Massport believes that Hanscom Field will maintain its role as a major general aviation reliever, and that its geographic proximity to Logan, Worcester Regional and Manchester airports will prevent its development as a significant commercial airport. Additionally, commuter airlines serving Logan Airport are unlikely to move a significant number of flights from Logan Airport to Hanscom Field, since approximately 50 percent of passengers on Logan Airport's commuter flights connect to other Logan Airport flights and a significant number of passengers are travelling to Boston. However, any new commercial service initiatives proposed for Hanscom Field shall be reviewed for consistency with the *Hanscom GEIR* (HGEIR) and its Annual Updates, and shall be considered by the Hanscom Area Town Selectmen (HATS). Refer to Section 2.6 of the Supplemental DEIS/FEIR for a discussion of Hanscom Field.

Code	Topic 1	Topic 2	Comment	Response
339.3	Environmental Review Process	Public Process	...more public input is needed from the residents of Quincy...it is important for Massport to hold a community meeting before any decisions are made...these are quality of life issues that will have a major impact on North Quincy, Marina Bay, and Squantum residents.	There was an extensive public participation and review process during the preparation of the Airside Project Draft EIS/EIR. Public comments were received on the ENF after it was filed during the summer of 1995. In the fall of 1995, several public scoping sessions were held to provide community input to the subsequent state and federal scopes for the project. To assure that the Airside analysis was conducted with awareness and input from all concerned parties, the Massport Board established the Airside Review Committee (ARC), which consists of the Community Advisory Committee (with representatives from 24 communities surrounding Logan Airport), and 11 businesses and industry organizations. Massport also funded independent consultants for the CAC to provide them with the capacity to professionally assess the analysis and conclusions of the Airside Study. Between 1995 and 1999, Massport held 16 meetings with the ARC, an additional 15 meetings with just the CAC, and several meetings with the CAC consultants. In addition, Massport made 29 presentations to elected officials, most of whom represent Logan Airport's neighboring communities, and Massport held 45 meetings with community and business leaders, reaching an audience of more than 3,000 people. During the public comment period on the Airside Project Draft EIS/EIR, the FAA held two public hearings. In January 2000, in response to the FAA's review of the Draft EIS, the FAA called for preparation of a Supplemental Draft EIS to address specific issues identified by the FAA following input from a SDEIS Panel consisting of six persons. At the FAA's direction, three SDEIS Panel members were appointed by the Governor of the Commonwealth of Massachusetts and three were appointed by the Mayor of the City of Boston. Under the direction of the New England Region FAA, the SDEIS Panel convened in March of 2000 and then met at least monthly with a final meeting in December of 2000. A total of 12 meetings were held. To provide the appropriate background, the SDEIS Panel was presented with an Interim Supplemental Draft EIS, the Airside Project Draft EIS/EIR, answers to key letters written by members of the public, concerned agencies and public officials responding to the Airside Project Draft EIS/EIR, and a series of 15 visual and written presentations from the Project's technical consulting team and other independent industry experts.

LETTER 340

22 Sonoma Road
Quincy, MA 02171

April 14, 1999

Secretary of Environmental Affairs
Attention MEPA Office
Mr. Arthur Pugsley - EOEA No. 10458
100 Cambridge Street
20th Floor
Boston, MA 022025

and

John C. Silva
Manager Environmental Programs
Airports Division, ANE-600
New England Region
12 New England Executive Park
Burlington, MA 01803

Dear Mr. Pugsley and Dear Mr. Silva:

It has been said that the new runway and expansion project at Logan is in the bag.

Did you shudder as you read that?

I do hope so. Because, you see, according to statements attributed to John Devillars, Regional Administrator, Environmental Protection Agency, in The Boston Globe (April 4, 1999) that just may be so. Please read them. Do you get the same impression?

He is mighty vocal for someone who will reserve judgment until the review process is complete and, yet, he speaks in the same interview of Massport's significant obligation to compensate the community with other quality-of-life enhancements (such as?). Does he not understand that there is no compensation for what has been taken in peace of mind and qualities of life?

Massport's situation at Logan is a problem of their own creation because of years of not keeping up with the future of air travel and not siting a new airport when projections showed that it was necessary to do so. Their current problems are an accumulation of years of inaction on their part. The current proposal is also short sighted. Massport has apparently captured the hearts of the business community; they have come out pretty

unanimously in favor of Logan's expansion plans, ostensibly because it is good for the economy. Who in that auspicious group of businessmen would make a $25,000,000.00 investment for such a short term solution to such a big problem with such futuristic ramifications? Why do they align with Massport? Economics is what Massport would have everyone believe this is all about. But it does not make good economic sense. So, what is the story behind the story? 340.1

None of the persons, none of the communities who for so long have borne the burden of responsibility for the economic well being of the entire Commonwealth should be burdened with further abuse.

For some it will be better, for others it will be worse. I have read this and heard this expressed. From the North Shore to the South Shore, consider that we are a small segment of a larger body. Moving the pain from the elbow to the knee does not take away the pain. And, in this case, no one seems to have recognized that there is a mid section and left side to this body that has been left out of the equation. It is time to think of us as one body from west to east from north to south. One body. The conditions at Logan are the responsibility of the entire Commonwealth. A very small portion of the Commonwealth has been burdened with the harsh reality of the airport. It is the eastern seaboard and contiguous cities that are bearing the brunt of the calamity called Logan Airport. Massport's hindsightedness has inflicted intolerable noise, air pollution, and quality of life abuses on an area, the population of which is in excess of one million people, 24 hours a day, 7 days a week, 365 days a year. You cannot allow this inequity to continue. The population of the Commonwealth is in excess of six million people.

The Human Element is rarely considered. It is the only factor on which a decision should be made. Every time I hear the word mitigation my stomach turns. It is the equivalent of a prison sentence. It is an inhumane way to live.

We are not laboratory specimens. Just because a specific decibel level is determined to be tolerable or acceptable by a standard, does not mean that we are able to or should have to tolerate that level of noise. Constant noise is intolerable. 340.2

Mr. Crockford (Globe, April 12, 1999) in remarks attributed to him stated, "You cannot discern what's a truck and what's a plane on any accurate basis". This comment was in a statement regarding Massport's monitor data as being irrelevant because it also picks up ground noise. If the reading is that high, it really does not make a difference; the noise is not tolerable. I get more than my fair decibels worth of airplane noise every day of my life. In addition, I am also subjected to train noise, residual expressway noise and extended periods of gun range noise. What is his point?

I must question why Massport continually boasts of the fact that most of the takeoffs will be over the water, thereby lessening impact. Where I live, airplane noise roars off the water. You can hear that roar before you see the planes, and for long after they become minute specks in the sky. Then there are the "ghost" planes, you can hear them, but never see them. For over a year, there has been a marked increase in the volume of that roar and in the number of flights. Something has changed. Many times the feeling is like being at the back end of a rocket booster. The noise starts at 5:35 in the morning. The continuous noise lasts until sometime around 1:00 A.M. Other noise can routinely be heard at 3:15 A.M. Planes are flying closer and making a greater impact. I live nine miles south of the airport. The water does not baffle sound, it enlarges it and it travels over a greater distance. I regret that I have not called the airport every time the noise is intolerable or every time a plane flew so close that it became frightening or every time I was awakened in the night; it would be an every day event. There is some respite, some time, but during the day or night, just about every day and night, the noise is prevalent to the point of distraction. 340.3 340.4

With the prediction of 40,000 more planes in the air by the year 2001, there is no improvement in the quality of life no matter how many runways are added. More planes, more noise; it is as simple as that.

Do you have statistics on the amount of pollution that airplanes reintroduce (every time they take off) into the ocean that we are paying dearly to clean and into the neighborhoods whose residents are paying dearly with their health? 340.5

Do you have statistics on the numbers of people who have to travel from the mid and western areas of the Commonwealth to get to Logan Airport; how much pollution; how much wasted gasoline; how many lost hours to those travelers and business people, because Logan sits at the far side of the Commonwealth? 340.6

Base none of your decision on the reasoning that when you buy a home near an airport you must expect airplane noise and related inconvenience. One fact that comes through loud and clear throughout the hearings and commentary made by those affected, we are communities made up of multigenerational families. We are committed to our communities. We have become caught up with the resurgence of pride in our city and inner city older communities; we are investing in them. Our caring and interest is what makes Boston a nice place to visit. Without us, our caring, the cities would not be worth visiting. We have grown with the aviation technological changes that have occurred in the 75 years that Logan has existed and have been able to maintain the integrity of the cities in spite of Logan. But, enough is enough.

Massport, on the other hand, did not grow with the aviation demands that were placed on them. After the injunction was placed in the 70's, we had every right to think that we could live in peaceful co-existence with Logan/Massport. As soon as the injunction was placed on them, they should have been looking to their future as we have. Instead, they chose to do nothing. They, therefore, must live with their self-inflicted problems. Massport has had 23 years to find the solution. They have been complacent with their lot in life and addressed problems after the fact, not as anticipatory measures. It does not speak well of their ability to run their business. There is no solution for Massport's problems at Logan. A new airport and regionalization are the only solutions. If it takes, ten years to accomplish that end, then so be it. Massport has wasted 23 years, what is another ten years? 340.7

I would like to point out that Massport *did* take the time to meet with the Editorial Staff of our South Shore newspaper, The Patriot Ledger, and, obviously, was very convincing, because the paper came out in favor of airport expansion projects.

Massport *did* meet with the Board of Directors of the South Shore Chamber of Commerce and that body represented that they spoke in behalf of their membership and voted unanimously in favor of expansion projects at Logan. As a member of the South Shore Chamber, I take issue with the fact that they came out in favor of expansion. The airport issue has far reaching negative impact and the Chamber should have brought the issue to the members to enable them to make a decision, instead of representing that 2500 members were in favor. I have made my opinion known to them.

Massport *did not* make an attempt to present their program for expansion to the residents of the South Shore. Instead they presented to persons who had control over large numbers of people, convinced them it was good and encouraged them to go forth and spread that good news to the masses. The Ledger did that. The Globe did that. The Herald did that. Rather sneaky of Massport, I say. 340.8

I do not believe that Boston is the only place for a major airport. I do not believe any of the statements or reports that indicate that other locations are inappropriate for an airport, that no one would come if an airport was located here or there. I am of a build it and they will come mentality.

I think the expansion plan is poorly thought out, that the effect on quality of life will be devastating, that there is no expansion solution at Logan, that there is really only one solution a new airport; regionalization will always be important; infrastructure to handle the certain increase in demand is essential. The most important aspect is to create a master plan that is more far-sighted than the end of Massport's nose; that seems to be as 340.9

futuristic as they are capable of thinking. Remember, they had 23 years to do the right thing for aviation progress and for the people.

Another day. Another rub. Governor Cellucci will announce today that Massport is taking over Worcester Airport and will create infrastructure that will make access easy. Timing wise, it seems to be politics, as usual. Is this supposed to make it appear that Massport is/has been doing the right thing all along; make us feel that progress is being made; make it appear that we can call off the watchdogs now? Cynical aren't I? It goes with the issue.

Rub number two. Three million dollars! Our money was used to fight us instead of putting it to good use; doing better research; assessing health risks; finding an honest solution. Such waste. This gives insight to the ilk of the persons involved in this project. One thing is certain, *we* could have put that money to much better use.

There will be no concessions, no compromise with regard to 14/32. Massport must bring Worcester up to par, including infrastructure, as should have been done so long ago and with no strings attached. If it will be a long and painful process, I say, grin and bear it Massport. This has been their message to us for so long, too long. It is time Massport did the right thing.

Mr. Pugsley and Mr. Silva, Logan Airside Improvements Planning Project ("Project") is not good for the people (The Human Element), please do not approve it; it is wrong.

Sincerely,

Marie J. Stamos

Code	Topic 1	Topic 2	Comment	Response
340.1	Alternatives	Runway 14/32	...[The current proposal] is a short term solution to...a big problem....	Based on simulation modeling, Logan Airport experienced 120,000 hours of runway-related delays in 1998. If no actions are taken, runway-related delays are forecast to grow as high as 333,000 hours under a 37.5M High Fleet scenario. The Preferred Alternative produces immediate and long-term benefits by lowering runway delays by 38,000 hours if it had been in place in 1998, and by as much as 94,000 hours in the future 37.5M High Fleet scenario. Because of the impact of the regional alternatives, the 37.5M High Fleet scenario is not expected to be achieved until 2015. The sooner airside efficiencies are implemented; the more benefits will accrue over time. Section 4.6 of the Supplemental DEIS/FEIR shows that delay reduction benefits increase over time as traffic levels increase.
340.2	Noise	Impacts	Just because a specific decibel level is determined to be tolerable or acceptable by a standard, does not mean that we are able to or should have to tolerate that level of noise. Constant noise is intolerable.	The acceptability of constant or time varying noise levels depends on its level and context as well as the state of the listener. The federal guidelines are primarily for the protection of people from noise exposures that interfere with human activity, such as speech communication.
340.3	Alternatives	Runway 14/32	...[Although] most of the takeoffs will be over the water...Where I live, airplane noise roars off the water.	Sound is reflected off the water and adds to the sound exposure of people who live on the water. However, the use of over-water departure routes at Logan Airport has been developed successfully to minimize the number of people affected by noise.
340.4	Noise	Impacts	For over a year, there has been a marked increase in the volume of that roar and in the number of flights...The noise starts at 5:35 in the morning. The continuous noise lasts until sometime around 1:00 AM. With the prediction of 40,000 more planes in the air by the year 2001, there is no improvement in the quality of life no matter how many runways are added. More plans, more noise....	The major source of aircraft noise in the Quincy area is the arrival of aircraft on Runway 4R and Runway 4L. In the future year fleet scenarios, the effective jet arrivals on these runways is significantly less with the addition of Runway 14/32 (refer to the comparison between Alternatives 1A and Alternative 4 in Table 6.2.3 in the Airside Project Draft EIS/EIR).
340.5	Air Quality	Standards	Do you have statistics on the amount of [air emissions] pollution that airplanes reintroduce (every time they take off) into the ocean...and into the neighborhoods whose residents are paying dearly with their health?	The emissions inventories for future conditions and alternatives are contained in Section 6.4 and Appendix F of the Supplemental DEIS/FEIR. These inventories show that all Alternatives, including the No Action and Preferred Alternatives, are well within acceptable criteria. In addition, dispersion modeling indicates no violation of the NAAQS for the pollutants analyzed (CO, NO and PM_{10}) under any alternative and future year.
340.6	Ground Transportation	Access to Logan	Do you have statistics on the numbers of people who have to travel from the mid and western areas of the Commonwealth to get to Logan Airport; how much pollution; how much wasted gasoline; how many lost hours to those travelers and business people, because Logan sits at the far side of the Commonwealth?	Although this specific information is not available, Massport has a long-standing relationship with the City of Worcester to aid Worcester Regional Airport in reaching its full potential, thereby improving the efficiency of the New England air transportation network. Massport assumed operational control of the Worcester Regional Airport on January 15, 2000. Refer to Section 2.10 of the Supplemental DEIS/FEIR for a discussion of Massport's efforts to promote increased utilization of Worcester Regional and other regional airports.

Code	Topic 1	Topic 2	Comment	Response
340.7	Regional Transportation	Regional Airports	A new airport and regionalization are the only solutions. Massport must bring Worcester up to par, including infrastructure, as should have been done so long ago....	A second major airport is not a solution to the current delay and congestion problems at Logan Airport. The Proposed Project to reduce delay and enhance safety at Logan Airport must be implemented in the near term to address current and future operating conditions. Even if a second major airport were to be pursued, the planning period for site selection and environmental review would require ten to 15 years, in addition to a multi-year construction period. Rather, Logan Airport is part of a regional system of airports that includes the T.F. Green/Providence, the Manchester, and the Worcester Regional airports. Service development and increased passenger traffic at these airports are an important part of the region's long-term strategy to accommodate passenger and activity growth. Greater use of the regional airports will provide passengers within the service area of such airports with a viable alternative to Logan Airport. Since demand within Logan Airport's primary service area will remain strong, the improvements at other regional airports will not eliminate the need for airside projects at Logan Airport.
340.8	Environmental Review Process	Public Process	Massport did not make an attempt to present their program for expansion to the residents of the South Shore.	There was an extensive public participation and review process during the preparation of the Airside Project Draft EIS/EIR. Public comments were received on the ENF after it was filed during the summer of 1995. In the fall of 1995, several public scoping sessions were held to provide community input to the subsequent state and federal scopes for the project. To assure that the Airside analysis was conducted with awareness and input from all concerned parties, the Massport Board established the Airside Review Committee (ARC), which consists of the Community Advisory Committee (with representatives from 24 communities surrounding Logan Airport), and 11 businesses and industry organizations. Massport also funded independent consultants for the CAC to provide them with the capacity to professionally assess the analysis and conclusions of the Airside Study. Between 1995 and 1999, Massport held 16 meetings with the ARC, an additional 15 meetings with just the CAC, and several meetings with the CAC consultants. In addition, Massport made 29 presentations to elected officials, most of whom represent Logan Airport's neighboring communities, and Massport held 45 meetings with community and business leaders, reaching an audience of more than 3,000 people. During the public comment period on the Airside Project Draft EIS/EIR, the FAA held two public hearings. In January 2000, in response to the FAA's review of the Draft EIS, the FAA called for preparation of a Supplemental Draft EIS to address specific issues identified by the FAA following input from a SDEIS Panel consisting of six persons. At the FAA's direction, three SDEIS Panel members were appointed by the Governor of the Commonwealth of Massachusetts and three were appointed by the Mayor of the City of Boston. Under the direction of the New England Region FAA, the SDEIS Panel convened in March of 2000 and then met at least monthly with a final meeting in December of 2000. A total of 12 meetings were held. To provide the appropriate background, the SDEIS Panel was presented with an Interim Supplemental Draft EIS, the Airside Project Draft EIS/EIR, answers to key letters written by members of the public, concerned agencies and public officials responding to the Airside Project Draft EIS/EIR, and a series of 15 visual and written presentations from the Project's technical consulting team and other independent industry experts.

Code	Topic 1	Topic 2	Comment	Response
340.9	Environmental Review Process	Public Process	...there is no expansion solution at Logan...there is really only one solution a new airport; regionalization will always be important; infrastructure to handle the certain increase in demand is essential.	Because the development of a second major airport would require ten to 15 years for site selection and environmental review, in addition to a multi-year construction period, this option is not viewed as a solution to accommodating forecast demand over the next 20 years. Hanscom Field's potential service area overlaps with the service areas for several airports that already have the necessary infrastructure for commercial service. These airports are the Hanscom Field, T.F. Green/Providence, and Worcester Regional, all which have had or are undergoing major improvements to their terminal buildings, other landside facilities and airfields.

LETTER 341

IVAN AND NANCY BLECHER
1025 WINTHROP AVE
REVERE. MASS. 02151

APRIL 22, 1999

MR. ARTHUR PUGSLEY
SECRETARY OF ENVIRONMENTAL AFFAIRS (MEPA OFFICE) EOEA NO. 10458
100 CAMBRIDGE STREET 20TH FLOOR
BOSTON, MASS 02202

DEAR MR. PUGSLEY,

I RESIDE WITH MY WIFE AT 1025 WINTHRROP AVE, REVERE, MASS (BEACHMONT). I HAVE BEEN AT THIS ADDRESS FOR 12 YEARS.

WE ARE BOTH AGAINST THE PROPOSED NEW RUNWAY AT LOGAN AIRPORT. THE NOISE LEVELS OF AIRPLANES NIGHT AND DAY ARE OVERWHELMING. I HAVE APPEALED TO MASSPORT ON MANY OCCASIONS BUT TO NO AVAIL. THE NOISE LEVELS HAVE QUARDRUPLED IN THE TWELVE YEARS, GETTING WORSE AND WORSE. 341.1

MASSPORT, ON MY REQUEST, SENT AN OUTSIDE "EXPERT" TO EXAMINE NOISE LEVELS AROUND MY HOME. OF COURSE, HE CAME WHEN THE RUNWAY EFFECTING MY HOUSE WAS NOT BEING USED (4-4R AND 4-4L). HIS REPORT TO MASSPORT AND MYSELF WAS INACCURATE. I CANNOT AFFORD TO HAVE THIS TEST PERFORMED MY AN INDEPENDENT EXPERT OR THE RESULTS WOULD HAVE BEEN ENTIRELY DIFFERENT.

THE NEW PROPOSED RUNWAY WOULD ONLY INCREASE THIS EFFECT, WHETHER IT WOULD BE ME OR SOME OTHER RESIDENTS.

THE SOOT ON WINDOWS IS ANOTHER PROBLEM THAT THIS AIRPORT IGNORES AND THE LONG-RANGE EFFECTS ON HEALTH.

I HAVE PROBABLY LOGGED OVER 5,000 NOISE COMPLAINTS TO MASSPORT, BUT NOTHING WAS EVER DONE TO EVEN ALLEVIATE THIS PROBLEM. AIRPLANES FLY OVERHEAD AS EARLY AS 5:30 A.M. AND AS LATE AS 2:30 P.M. 341.2

THANKING YOU FOR YOUR TIME. I HOPE YOU CAN HEAR ME, BECAUSE I CAN'T EVEN HEAR MY WIFE WHEN SHE TALKS TO ME WITH THE NOISE OVERHEAD!

SINCERELY,

IVAN BLECHER

Code	Topic 1	Topic 2	Comment	Response
341.1	Noise	Runway 14/32	We are both against the proposed new runway at Logan Airport. The noise levels of airplanes night and day are overwhelming. The new proposed runway would only increase this effect....	The noise exposures in Revere are lower in 2010 with the Preferred Alternative than with the No Action Alternative (refer to Tables 6.2.9 and 6.2.10 in Volume 1 and Tables 1.3-1.5 in Appendix L of the Airside Project Draft EIS/EIR and compare Alternative 1A and Alternative 4).
341.2	Public Health	Effects	The soot on windows is another problem that this airport ignores and the long-range effects on health.	The soot in urban areas comprises compounds from a variety of sources, primarily roadways Monitoring of airborne soot levels in the vicinity of Logan Airport has shown that the airport is a very small (less than one percent) contributor. The air quality analysis, based on EPA/MDEP models and guidelines, performed for the Supplemental DEIS/FEIR is considered to be comprehensive and state-of-the-art. Neither Massport nor the FAA has a program to increase passenger demand at Logan Airport. Rather, the objective of both organizations is to accommodate demand safely and efficiently. The recommended Airside Project is intended to enable Logan Airport to accommodate current and future aircraft activity with minimum delay. The construction of Runway 14/32 would significantly reduce delays associated with northwest wind conditions, but would not be expected to induce additional aircraft traffic or passenger activity at Logan Airport.

149 Endicott Ave., Revere MA 02151

LETTER 342

Secretary of Environmental Affairs
Attention MEPA Office
Mr. Arthur Pugsley - EOEA No. 10458
100 Cambridge Street, 20th Floor
Boston, MA 2025

John C. Silva
Manager, Environmental Programs
Airports Division, ANE-600
New England Region
12 New England Executive Park
Burlington, MA 01803

Dear Mr. Pugsley and Mr. Silva,

Please consider the following comments as you deliberate on the environmental effects of the Logan Airside Improvement Program.

Runway 14-32

Will Revere experience a growth in traffic with Runway 14/32? The numbers of operations in Appendix H indicate that by 2010

Arrivals on 22 Left will go from

- 8,661 in 1993 to 13,678 - 21,367 with no action
- to 13,285 - 20,068 with no runway
- to 8,310 - 12,474 with runway 14/32.

342.1

Departures on 4 Right will go from

- 23,092 in 1993 to 16,727 - 20,510 with no action
- 16,645 - 21,502 with no runway
- 14,717 - 17,946 with runway 14/32.

These numbers indicate that runway 14/32 won't make life any better, but without

runway 14/32, life will be a lot worse.

A word about noise: many of these future operations will occur in larger planes. Some of these new planes are quieter, but technically, heavier planes are allowed to make more noise and still be Stage 3 compliant. Is there a study somewhere in the EIS/R which predicts how many of the 2010 fleet will truly be quieter? Is this factored into the noise analysis? 342.2

The benefit of the quieter Stage 3 aircraft peaks in 1999, as is indicated on the noise charts. However, it seems that by 2010, Revere will experience as much or more noise as in the base year of 1993. Will some of that yearly average of noise include multiple flights of over 100 decibels between 7:00 and 7:30 on a summer Sunday morning as has been the case in the past? It is good to point out that even though some residents have soundproofed houses, others don't. Sometimes this is because they could not afford to bring their house up to code to qualify for the program. Secondly, porches, terraces, streets, playgrounds and beaches cannot be soundproofed. 342.3

Logan's rise in activity has an adverse environmental effect. We residents pay a high price for the benefit of business as usual. But the threat is that if we don't have 14/32, the price will be even higher.

Lowering the minimum

The EIS/R did not consider this feature to have any environmental effect, since it was not mentioned in Vol. I, Chapter VI, Draft Environmental Impact Statement. Nor is it pictured on the cover graphic. We believe it does have an impact, both from noise and from safety.

Using the information provided in Appendix D, Massport predicts 122 more hours of dwell exceedence and 194 more hours of persistence exceedence (2010 37.5M low fleet) for those affected by runway 22/4. That means more noise in Beachmont, most of it probably in summer fog. It is stated that "these small changes can be attributed to the slightly increased availability and the **resulting rise in equivalent jet operations during IFR conditions.** " (emphasis added) As was explained in the preceding comments on 14/32, traffic is predicted to continue to grow, which would put more planes over our heads -- more planes in worse weather. 342.4

We have been told verbally that Beachmont will benefit from moving the Decision Height from Belle Isle Marsh to just past Saratoga Street. We won't hear the noise of an aborted landing, although our East Boston neighbors will. It is good to point out that the 217' above sea level Decision Height is not on the airport. It is over 2000 feet from the runway end, and very close to East Boston.

As for noise, our experience is that those planes which come in with a low cloud cover are very loud because of the effect of the noise bouncing off the moisture in the air. That means more planes coming in worse weather will be noisier.

As far as safety is concerned, the study states that lowering the visibility minima will increase flexibility "by avoiding crosswind landings." It is not clear if planes are now landing with more of a crosswind than they would like, but it is implied. Does that mean that safety has been compromised for the last 20 years?

This is not meant as a rhetorical question, but it brings up the point that the issue of lowering the visibility minima for landing should not be folded into this environmental impact report. We deserve to understand more clearly why we will be safer with lowered minima. For a start, could the word "transponder" be included in the glossary? 342.5

A further criticism of this presentation is that the height of Beachmont Hill, as presented to the many readers of this study, is questionable. The top of the Mary T. Ronan, housing a beacon, is well over the height protrayed in Figure 3 of Appendix D. Given the angle of descent and the height of the hill, planes are not much more than 300' above us. We would like the pilot and copilot to see us. 342.6

In conclusion, we see that we will get less punishment with 14/32 than without it, but we will experience a constant increase in overflights as Logan's traffic expands. This will translate into noise for us. We are not getting a break.

Secondly, we are seriously concerned about the proposal to lower the cloud ceiling for landings on Runway 22 Left. It will certainly bring more noise and seems to be a possible danger. We think this matter needs to be explored more fully.

Sincerely,

Lynn Mazzaullo

Code	Topic 1	Topic 2	Comment	Response
342.1	Alternatives	Runway 14/32	Will Revere experience a growth in traffic with Runway 14/32? ...[Air traffic projections] indicate that runway 14/32 won't make life any better, but without runway 14/32, life will be a lot worse.	Revere is nearest the flight paths of Runway 4L/R departures and Runway 22L/R arrivals. The Supplemental DEIS/FEIR indicates that the Preferred Alternative would promote runway use in a manner that is more consistent with annual PRAS goals, reducing the current dependence on northeast/southwest operations. This will lead to a decreased percentage of equivalent operations over Revere. Additionally, by increasing the number of operations over water, Runway 14/32 would reduce the total annual hours of dwell and persistence over populated areas in accordance with short-term PRAS goals, cutting dwell and persistence over Revere significantly.
342.2	Noise	Hushkitted Aircraft	A word about noise: many of these future operations will occur in large planes...[which may be] quieter, but...are allowed to make more noise and still be Stage 3 compliant. Is there a study somewhere in the EIS/R which predicts how many of the 2010 fleet will truly be quieter? Is this factored into the noise analysis?	The noise characteristics of the future aircraft are factored into the noise analysis. Many new large aircraft, such as the Boeing 777 and the Airbus A330, will be much quieter than today's large Stage 3 aircraft because their engines are quieter and because, during takeoff, they climb much faster because they have two instead of four engines. FAR Part 36 permits larger (heavier) Stage 3 aircraft to generate more noise than smaller ones. However, the latest generation of Stage 3 aircraft are quieter than FAR Part 36 requires. Appendix I of the DEIS/R contains details of the individual aircraft types assumed in the future fleets. These types were used in the operations analysis as well as the noise analysis.
342.3	Noise	Impacts	...it seems that by 2010 Revere will experience as much or more noise as in the base year of 1993. Will some of that yearly average of noise include multiple flights of over 100 decibels between 7:00 and 7:30 on a summer Sunday morning as has been the case in the past...porches, terraces, streets, playgrounds and beaches cannot be soundproofed. Logan's rise in activity has an adverse environmental effect.	The noise exposures in Revere are lower in 2010 with the Preferred Alternative than with the No Action Alternative (refer to Tables 6.2.9 and 6.2.10 in Volume 1 and Tables 1.3-1.5 in Appendix L of the Airside Project Draft EIS/EIR and compare Alternative 1A and Alternative 4).
342.4	Alternatives	Reduced Approach Minima	The EIS/R did not consider ...[lowering the minimum] to have any environmental effect...We believe it does have an impact, both from noise and from safety. Massport predicts 122 more hours of dwell exceedence and 194 more hours of persistence exceedence (2010 37.5 low fleet) for those affected by runway 22/4. That means more noise in Beachmont, most of it probably in summer fog..."these small changes can be attributed to the slightly increased availability and the resulting rise in equivalent jet operations during IFR conditions"...traffic is predicted to continue to grow, which would put more planes over our heads-- more planes in worse weather...our experience is that those planes which come in with a low cloud cover are very loud because of the effect of the noise bouncing off the moisture in the air.	The preferential runway rules at Logan Airport have late night departures on Runway 16 over the harbor as the highest priority to minimize departures over highly populated neighborhoods.

Code	Topic 1	Topic 2	Comment	Response
342.5	Alternatives	Reduced Approach Minima	...lowering the visibility minima for landing should not be folded into this environmental impact report. We deserve to understand more clearly why we will be safer with lowered minima.	The agreement between the City of Boston, the FAA and Massport stipulates that any modification of the existing minimums requires completion of an EIS/EIR, even though the setting of minimums is otherwise categorically excluded from the EIS/EIR process. The reduced minimums will, in fact, enhance safety by providing precision guidance to a point closer to touchdown and reducing reliance on Runway 4R under poor weather conditions, when winds may favor use of an alternate runway.
342.6	Alternatives	Reduced Approach Minima	A further criticism of this presentation is that the height of Beachmont Hill, as presented to the many readers...is questionable. The top of the Mary T. Ronan, housing a beacon, is well over the height portrayed in Figure 3 of Appendix D. Given the angle of descent and the height of the hill, planes are not much more than 300' above us. We would like the pilot and copilot to see us.	Based on the analysis, aircraft passing over the top of Beachmont Hill would be approximately 500 ft above sea level, which is more than 300 ft above the top of Beachmot Hill.

LETTER 343

April 22, 1999

Robert Durand
Secretary of the Executive Office of Environmental Affairs
100 Cambridge Street – Room 2000
Boston, MA 02202

Dear Mr. Durand:

I am writing to express my strong opposition to Runway 14/32. I purchased a 3-family house in Roslindale in 1991, was married in 1993 and now have 2 children. I bought the house under uncertain economic conditions, and when the prevailing wisdom was that middle-class families would continue to flee the cities for the suburbs until few, if any would be left. I have invested over $70,000 in upgrading my property, including de-leading.

I believed then and believe now more than ever that my investment made sense. The city has always had the advantages of having a rich history and culture. And it has recently made great strides in many areas including reducing crime, improving schools, and attracting economic investment in neighborhood infrastructure and business revitalization.

One nuisance, however, that I have seen grow into a significant problem over the last couple of years is the noise and pollution of air traffic that now runs directly over my home. I was resentful when recent flight pattern changes made my once quiet neighborhood far noisier. And I am very upset at the potential of the problem growing worse. 343.1

Please do what you can to help find a long-term regional and environmentally friendly solution to air traffic congestion.

Thank you for your help.

Sincerely,

Matthew S. Baronas
80 Sherwood Street

343.1	Noise	Impacts	One nuisance...that I have seen grow into a significant problem over the last couple of years is the noise and pollution of air traffic that now runs directly over my home [in Roslindale]...flight pattern changes made my once quiet neighborhood far noisier...I am very upset at the potential of the problem growing worse.	The Supplemental DEIS/FEIR projects that the Preferred Alternative would promote runway use in a manner that is more consistent with annual PRAS goals. The total number of departures from Runway 27 (over South Boston, Roxbury, and Jamaica Plain) would increase, but the number of equivalent jet operations would remain essentially the same. The difference in these communities would be fewer nighttime operations and more daytime operations but the same noise impacts. Total departures from Runway 33L and arrivals to Runway 15R (over East Boston and Chelsea) would increase, but most of these are non-jets. These runway operations are currently running well below the PRAS goals, and the unidirectional Runway 14/32 would allow the controllers to approach, but still remain below the annual goals for these operations. Additionally, by increasing the number of operations over water, Runway 14/32 would reduce the total annual hours of dwell and persistence over populated areas in accordance with short-term PRAS goals.

Dear Mr. Durand,

My comments to the EIR-Logan Airside Improvements Plan EOEA #10458 are as follows:

With the obvious increase in noise that a new runway will produce, I will have to consider moving from Boston altogether. I think seriously that there will be "flight" from the city because our quality of life will be seriously altered. Please do not do this to this wonderful city!!! 344.1

Code	Topic 1	Topic 2	Comment	Response
345.1	Alternatives	Runway 14/32	Boston will be ruined by this noise.	While equivalent jet operations increase by more than 50 percent from a 1993 base to the future 37.5M High Fleet scenario if the Preferred Alternative is implemented, the appropriate basis for comparison of the Preferred Alternative is the No Action Alternative. Equivalent jet operations would increase by more than 75 percent over the Preferred Alternative if no action were taken. Despite the increase in equivalent jet operations, the Airside analysis indicates that overall noise impacts decline over time with the elimination of Stage 2 aircraft and the replacement of hushkitted Stage 3 aircraft with non-hushkitted Stage 3 aircraft. By allowing aircraft operations to shift from over-land to over-water routings and by providing greater flexibility in the use of Runways 27 and 33L for takeoff, the Preferred Alternative further reduces the highest noise impacts to the close-in neighboring communities. Furthermore, the Supplemental DEIS/FEIR also demonstrates the more equitable balance of noise impacts among communities surrounding Logan Airport that can be achieved with the Preferred Alternative as opposed to the imbalance that occurs today and would occur in the future if no action is taken.

VIA FACSIMILE

LETTER 346

37 Prospect Avenue
Roslindale, MA 02131

Attn: MEPA Office

RE: EOEA # 10458

Dear Mr. Durand:

We appreciate the opportunity to comment on MassPort's DEIS for the proposed runway 14/32 at Logan airport. We have only recently become aware of the project and have not had a chance to review the DEIS thoroughly. We have, however, spoken with neighbors, read recent news articles and pulled information off the internet to inform ourselves about MassPort's proposal. Based on this, we submit the following comments.

We bought our home in Roslindale in 1994. It has been a delight to live in our neighborhood and raise a family so near urban open spaces such as Franklin Park and Arnold Arboretum. Generally, our neighborhood is quiet, with the occasional distant sound of a passing commuter rail train. However, on certain days we notice that the air traffic increases dramatically and disrupts outdoor play, indoor conversation, and sleep. We have learned that these are the days when runway 27 is in use. Planes roar overhead at a rate of about 1 or 2 per minute. This would become the norm if MassPort's proposed expansion is implemented. 346.1

We are firmly against the proposed airport expansion for two key reasons. First, like thousands of area residents, we are alarmed by the projected increase in air traffic over the Roslindale area (including the popular oases of Franklin Park and the Arboretum) to about 45,000 flights/year. That's 120 flights per day! Our relative urban quiet will be shattered and our quality of life severely impacted. In addition, we suspect this would have a negative effect on our property value. 346.2

Second, despite the reportedly extensive public participation program MassPort has undertaken, it appears that the agency has not used a consensus building approach to achieve the wisest solution 346.3

to the airport's capacity problem. Instead, the proposal put forward in the DEIS seems to be a politically driven measure that ignores or downplays alternatives that could more elegantly resolve the short- and long-term problems, as well as enjoy a broader level of public support.

Given that there are serious questions regarding the adequacy, quality and reliability of information contained in the DEIS, we request that your Certificate declare the document inadequate and that you direct MassPort to conduct a more thorough evaluation of alternatives and engage a broad range of stakeholders in a rigorous consensus building process. Issues that need to be better addressed include: developing a regional approach to handling projected long-term growth in air traffic, building a second urban airport, and using more current studies and figures in developing and evaluating alternatives. Addressing the issue of airport capacity for the Greater Boston area will impact so many Boston area residents that achieving reasonable consensus is essential. 346.4

Respectfully,

Stephanie Moura
Kate Keeler

Code	Topic 1	Topic 2	Comment	Response
346.1	Alternatives	Runway 14/32	...on certain days [when Runway 27 is in use] we notice that the air traffic increases dramatically [over Roslindale] and disrupts outdoor play, indoor conversation, and sleep. Planes roar overhead at a rate of about 1 or 2 per minute...[which] would...be the norm if Massport's proposed expansion is implemented...we are alarmed by the projected increase in air traffic over the Roslindale area...Our relative urban quiet will be shattered and our quality of life severely impacted.	The model and methods used to develop these data were based on EPA- and DEP-approved guidelines and show that the NAAQS will not be violated. The Supplemental DEIS/FEIR projects that the Preferred Alternative would promote runway use in a manner that is more consistent with annual PRAS goals. The total number of departures from Runway 27 (over South Boston, Roxbury, and Jamaica Plain) would increase, but the number of equivalent jet operations would remain essentially the same. The difference in these communities would be fewer nighttime operations and more daytime operations but the same noise impacts. Total departures from Runway 33L and arrivals to Runway 15R (over East Boston and Chelsea) would increase, but most of these are non-jets. These runway operations are currently running well below the PRAS goals, and the unidirectional Runway 14/32 would allow the controllers to approach, but still remain below the annual goals for these operations. Additionally, by increasing the number of operations over water, Runway 14/32 would reduce the total annual hours of dwell and persistence over populated areas in accordance with short-term PRAS goals.
346.2	Open Space/ Parkland	Impacts	We are alarmed by projected air traffic increases over the popular oases of Franklin Park and the Arboretum	The Supplemental DEIS/FEIR contains additional analysis of the project relative to parklands. As depicted in Figure 6.3-4 of the Supplemental DEIS/FEIR, the Arnold Arboretum, Emerald Necklace, and Franklin Park are well outside the 65 dB DNL noise contour associated with the Preferred Alternative. Therefore, the Airside Project will have no impact on these parklands. In addition, the Boston Harbor Islands, while within the No Action Alternative 65 dB DNL noise contour, will have no noise increase under the Preferred Alternative. Refer to Section 6.3 of the Supplemental DEIS/FEIR for additional discussion of parklands.

346.3	Environmental Review Process	Public Process	...despite the reportedly extensive public participation program Massport has undertaken, it appears that the agency has not used a consensus building approach to achieve the wisest solution to the airport's capacity problem.	There was an extensive public participation and review process during the preparation of the Airside Project Draft EIS/EIR. Public comments were received on the ENF after it was filed during the summer of 1995. In the fall of 1995, several public scoping sessions were held to provide community input to the subsequent state and federal scopes for the project. To assure that the Airside analysis was conducted with awareness and input from all concerned parties, the Massport Board established the Airside Review Committee (ARC), which consists of the Community Advisory Committee (with representatives from 24 communities surrounding Logan Airport), and 11 businesses and industry organizations. Massport also funded independent consultants for the CAC to provide them with the capacity to professionally assess the analysis and conclusions of the Airside Study. Between 1995 and 1999, Massport held 16 meetings with the ARC, an additional 15 meetings with just the CAC, and several meetings with the CAC consultants. In addition, Massport made 29 presentations to elected officials, most of whom represent Logan Airport's neighboring communities, and Massport held 45 meetings with community and business leaders, reaching an audience of more than 3,000 people. During the public comment period on the Airside Project Draft EIS/EIR, the FAA held two public hearings. In January 2000, in response to the FAA's review of the Draft EIS, the FAA called for preparation of a Supplemental Draft EIS to address specific issues identified by the FAA following input from a SDEIS Panel consisting of six persons. At the FAA's direction, three SDEIS Panel members were appointed by the Governor of the Commonwealth of Massachusetts and three were appointed by the Mayor of the City of Boston. Under the direction of the New England Region FAA, the SDEIS Panel convened in March of 2000 and then met at least monthly with a final meeting in December of 2000. A total of 12 meetings were held. To provide the appropriate background, the SDEIS Panel was presented with an Interim Supplemental Draft EIS, the Airside Project Draft EIS/EIR, answers to key letters written by members of the public, concerned agencies and public officials responding to the Airside Project Draft EIS/EIR, and a series of 15 visual and written presentations from the Project's technical consulting team and other independent industry experts.
346.4	Regional Transportation	Regional Airports	...the DEIS...downplays alternatives that could more elegantly resolve the short- and long-term problems, as well as enjoy a broader level of public support...conduct a more thorough evaluation of alternatives and engage a broad range of stakeholders in a rigorous consensus building process. Issues that need to be better addressed include: developing a regional approach to handling projected long-term growth in air traffic, building a second urban airport, and using more current studies and figures in developing and evaluating alternatives.	A second major airport is not a solution to the current delay and congestion problems at Logan Airport. The Proposed Project to reduce delay and enhance safety at Logan Airport must be implemented in the near term to address current and future operating conditions. Even if a second major airport were to be pursued, the planning period for site selection and environmental review would require ten to 15 years, in addition to a multi-year construction period. Rather, Logan Airport is part of a regional system of airports that includes the T.F. Green/Providence, the Manchester, and the Worcester Regional airports. Service development and increased passenger traffic at these airports are an important part of the region's long-term strategy to accommodate passenger and activity growth. Greater use of the regional airports will provide passengers within the service area of such airports with a viable alternative to Logan Airport. Since demand within Logan Airport's primary service area will remain strong, the improvements at other regional airports will not eliminate the need for airside projects at Logan Airport.

COMMENT PROCEDURE for: Draft Logan Airside Improvements (a.k.a. Runway 14/32) **EOEA #10458**

All comments on EIRs (environmental impact report) must refer to the EOEA file number. There may be other identifying numbers, but the EOEA file number is the one which must be used.

Comments not referring to the EOEA file number may not be considered.

Boston, MA 02202

Failure to address mail in this manner may result in delay of action on comments or no action on comments at all.

Dear Mr. Durand,

My comments to the EIR-Logan Airside Improvements Plan EOEA #10458 are as follows:

I am against the DRAFT Airside Improvement as written - This DRAFT seeks to increase flights over my neighborhood - A neighborhood with many low flying, large aircraft that pollute the air with NOISE and FUMES. It seems as if the planes are flying lower than they have in the past and as I stated earlier, when they are taking off, the noise especially, is very disruptive. 347.1

UNTIL these AIRCRAFT can be designed quieter and/or fly higher I can in no way support the increase of pollution (both AIR and NOISE) via AIR TRAFFIC in my community.

Thank you

Mary A. Moynihan

347.1	Alternatives	Runway Use	It seems as if the planes are flying lower than they have in the past...noise especially is very disruptive.	There have been no significant changes to aircraft arrival flight patterns at Logan Airport in several years, and while Runway 27 departure procedures have been modified, these changes do not lead to aircraft at lower altitudes. In addition, the noise impacts of individual flights have actually declined as Stage 2 aircraft have been phased out of the fleet and replaced with quieter aircraft types.

LETTER 348

To: Robert A. Durand, Secretary of Environmental Affairs
Please don't allow Runway 14/32 and the Centerfield Taxiway to be built . My family lives in a wonderful Roslindale neighborhood that is already affected by jets from runway 27 interrupting sleep and conversation. I wonder how many of the business people who are supporting this expansion at Logan live in areas of the city affected by the tremendous noise. We have families out of state and are frequently flying in and out of the city. I am actually impressed with the lack of delays in scheduled arrivals and departures from Logan and would never have considered it a problem. 348.1 348.2
Thank-you for your attention.

LETTER 349

SUBJECT too long. Original SUBJECT is
Testimony on Environmental Impact of Massport's Runway 14/32 Proposal

---------- Original Message Follows ----------
Dear Secretary Durand:

I testified at the public comment hearing held on Monday, April 5th, 1999. This letter is my written transcription of my oral statement with a few addendums. Thank you for accepting it and for providing the opportunity to testify.

My name is Alan Wright. I live at 57 Arborough Road in Roslindale, MA, next to the Arnold Arboretum. I am here tonight representing my family and neighbors all of whom are very concerned about Massport's proposal.

When Runway 27 is in use the direct overflight of Roslindale and the Arboretum is unrelenting and frequently deafening. Massport's proposal to build Runway 14/32 will nearly triple the overflights of Roslindale and the Arboretum to almost 45,000 per year. That means on average over 120 flights per day, year round. Of course, given variable use of the runway, many days will experience a much

349.1

This is intolerable and unreasonable. It must not be allowed as it adversely affects the environment of the Arnold Arboretum, Roslindale and surrounding communities.

349.2

When flights are overhead and I am outside playing with my child or talking with a neighbor, we frequently must stop talking as we cannot hear each other. And, we are located more than six miles from Logan Airport. Stage two aircraft, whether retrofitted or not, and large stage three aircraft are the main culprits. Their noise level is intolerable. I am frequently awakened late at night when cargo jets pass overhead -- even when my windows are closed!

349.3

Massport has not justified why the quality of life for the 35,000 residents of Roslindale, the tens of thousands of visitors to the Arnold Arboretum -- who come from all over Massachusetts, or the hundreds of thousands of residents of urban Boston and surrounding communities must decline.

Part of the problem is that the pilots seldom follow through on the Runway 27 path. Instead of staying over Franklin Park and Forest Hills Cemetery, they veer off over the Arboretum and Roslindale. Massport has promised to fix this problem but has not done so yet. The problem will only get worse if Runway 14/32 is built.

349.4

I chose to buy a house in Roslindale rather than move to the suburbs, as I am committed to the high quality of life the City of Boston offers. I greatly enjoy the parks, the downtown and the Harbor Islands. Family and friends who come to visit remark upon what a wonderful city Boston is. That quality will decline if Logan is allowed to grow more. The check on growth created by the current

prohibition on building new runways must remain in place. It is necessary to sp
ur even greater growth in outlying airports, which should include Hanscom Airfie
ld in some fashion. Obviously Logan cannot and should not be shut down, even th
ough it is badly located, but the air transportation needs of eastern Massachuse
st densely populated areas where the greatest number of people will be adversely
ffected.

349.5

Some claim that the supposed excessive number of delays experienced at Logan
will harm the greater Boston economy. Their claims are spurious and unfounded.
Our economy is based upon intense price competition. Travel is the most ineff
icient means of conducting business possible; new and growing businesses do not
seek to expand expensive travel budgets, they seek to reduce them. Video and te
le-conferencing are much more efficient means of conducting business and are gro
wing rapidly, along with other methods of electronic communication.

As Massport has indicated, the majority of Logan's growth will occur from to
urism and conventions. Tourists and conventioneers expect that their travel wil
l be delayed, whether by weather, traffic jams to and from airports or schedulin
g problems. They are not deterred from traveling to Boston because they may exp
acter of the City. The quality of their visit, particularly to the many histori
c sites in the urban core, to the revitalized downtown and the rebuilt seaport d
istrict, will be greatly diminished if Massport is allowed to increase the growt
h of Logan through building Runway 14/32. Please do not allow this!

Thank you.

349.1	Alternatives	Runway 14/32	When Runway 27 is in use the direct overflight of Roslindale and the Arboretum is unrelenting and frequently deafening. Massport's proposal to build Runway 14/32 will nearly triple the overflights.	The Supplemental DEIS/FEIR projects that the Preferred Alternative would promote runway use in a manner that is more consistent with annual PRAS goals. The total number of departures from Runway 27 (over South Boston, Roxbury, and Jamaica Plain) would increase, but the number of equivalent jet operations would remain essentially the same. The difference in these communities would be fewer nighttime operations and more daytime operations but the same noise impacts. Total departures from Runway 33L and arrivals to Runway 15R (over East Boston and Chelsea) would increase, but most of these are non-jets. These runway operations are currently running well below the PRAS goals, and the unidirectional Runway 14/32 would allow the controllers to approach, but still remain below the annual goals for these operations. Additionally, by increasing the number of operations over water, Runway 14/32 would reduce the total annual hours of dwell and persistence over populated areas in accordance with short-term PRAS goals. The Day-Night Sound Level (DNL) data from Noise Monitor No. 1 at Andrews Street in the South End show levels of 56, 55.2,and 56.9 dB for the 29M Low, 37.5M Low and 37.5M High Fleet scenarios with the Preferred Alternative. These levels are less than the1993 value of 57.9 dB and are well below the standard DNL criteria of 65 dB. 1993 is representative of historic high fleet operating conditions at Logan Airport.
349.2	Open Space/ Parkland	Impacts	This [proposal] is intolerable and unreasonable...adversely affects the environment of the Arnold Arboretum	The environmental justice analysis found no disproportionately high and adverse impacts to low-income and minority populations from direct project impacts. Refer to Section 6.2 and Section 6.8 of the Supplemental DEIS/FEIR, respectively, for additional information on noise impacts and environmental justice.
349.3	Noise	Runway 14/32	...[This proposal adversely affects] Roslindale and surrounding communities. When the flights are overhead and I am outside...we frequently must stop talking as we cannot hear each other. Stage 2 aircraft whether retrofitted or not, and large Stage 3 aircraft are the main culprits.	The Airside Project Draft EIS/EIR shows that the total noise impacts around Logan Airport will improve in the first decade of the 21st century, primarily from the elimination of the noisier Stage 2 aircraft, and by the gradual elimination of the hushkitted Stage 3 aircraft as they are retired.
349.4	Noise	Flight Tracks	Part of the problem is that the pilots seldom follow through on the Runway 2[7] path. Instead of staying over Franklin Park and Forest Hills Cemetery, they veer off over the Arboretum and Roslindale. The problem will only get worse if Runway 14/32 is built..	The problem of pilots not following the Runway 27 path needs to be discussed with the FAA and Massport. The FAA has pledged to do its best to achieve the new tracks that were developed in the Runway 27 EIS procedure. Also, new advances in technology, such as the Global Positioning Systems that are becoming a standard part of new aircraft flight control systems, can be used to ensure better compliance in the future.

M:\wwd\LP\07406\Docs\Reports\Renumbered Comments and Responses\Private Citizens_3.doc

Code	Topic 1	Topic 2	Comment	Response
349.5	Regional Transportation	Regional Airports	The check on growth created by the current prohibition on building new runways must remain in place. It is necessary to spur even greater growth in outlying airports, which should include Hanscom Airfield in some fashion. Video and tele-conferencing are much more efficient means of conducting business [than air travel]...and are growing rapidly...the majority of Logan's growth will occur from tourism and conventions. Tourists and conventioneers...are not deterred from traveling to Boston [because of delays]...The quality of the visits, particularly to the many historical sites in the urban core...will be greatly diminished if Massport is allowed to increase the growth of Logan through building Runway 14/32.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR, specifically considered the role of Hanscom Field in the analysis of regional alternatives. Hanscom Field, which serves as a general aviation reliever airport to Logan Airport, already accommodates a significant number of aircraft operations (183,000 operations in 1998). The Hanscom Field activity includes private, business, charter, and air taxi operations that might otherwise use Logan Airport. Since the Airside Project Draft EIS/EIR was filed, Shuttle America, a newly founded airline, began commercial scheduled operations at Hanscom Field, offering limited turboprop services to short-haul regional markets – Trenton, Buffalo, Hartford (discontinued), Wilmington, Delaware (discontinued), and Greensboro. Shuttle America is also conducting operations between Hanscom and New York LaGuardia Airport. While Massport supports commercial service at Hanscom Field consistent with its established limits (60 seat regulation), Massport believes that Hanscom Field will maintain its role as a major general aviation reliever, and that its geographic proximity to Logan, Worcester Regional and Manchester airports will prevent its development as a significant commercial airport. Additionally, commuter airlines serving Logan Airport are unlikely to move a significant number of flights from Logan Airport to Hanscom Field, since approximately 50 percent of passengers on Logan Airport's commuter flights connect to other Logan Airport flights and a significant number of passengers are travelling to Boston. However, any new commercial service initiatives proposed for Hanscom Field shall be reviewed for consistency with the *Hanscom GEIR* (HGEIR) and its Annual Updates, and shall be considered by the Hanscom Area Town Selectmen (HATS). Refer to Section 2.6 of the Supplemental DEIS/FEIR for a discussion of Hanscom Field. The acceptance of videoconferencing and other means of telecommunications by businesses as a substitute for air travel are largely dependent upon the quality of the available technology and private sector decisions outside the authority of FAA and Massport. Massport encourages such initiatives from state government, Amtrak, and others. Massport forecasts in the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR took account of the likely effect of such factors as videoconferencing over the forecast period. The FAA and Massport have consulted with the Massachusetts Historical Commission (MHC). The MHC has concurred with the FAA's determination that the Preferred Alternative will have no adverse effect on significant historic properties. Refer to Section 6.3 of the Supplemental DEIS/FEIR for a description of historic properties, project impacts and mitigation.

Boston, MA 02202

Failure to address mail in this manner may result in delay of action on comments or no action on comments at all.

Dear Mr. Durand,

My comments to the EIR-Logan Airside Improvements Plan EOEA #10458 are as follows:

No Justice No PEACE ! NO Justice No PEACE !

By Allowing MASSPORT to build Runway 14 32 - MASSPORT will INCREASE flights over runway 27 by 3 fold 14,000 flights to 60,000 flights. This means that Black people and other people of color will experience noise pollution and toxic fumes to levels that MASSPORT has not completely evaluated. We all know that Black people have the highest death and disease rates of all people. Roxbury residents will have another stress to their lives that will kill them in greater numbers. Black health indicators for Asthma, cardiovascular and lung disease is 30 to 300 times the white rates. Jet Planes fumes and Noise pollution will increase the aforementioned health problems. I have a child and I would like to see you concerned about their/her health like I am. Stop runway 14 32.

Code	Topic 1	Topic 2	Comment	Response
350.1	Environmental Justice	Impacts	Black people and other people of color will experience noise pollution and toxic fumes to levels that Massport has not completely evaluated.	The Environmental Justice analysis was significantly expanded in Section 6.8 of the Supplemental DEIS/FEIR. Low-income and minority populations were defined in accordance with Federal Executive Order 12898, the U.S. DOT Final Order, and the Council on Environmental Quality's guidance on Environmental Justice. In addition, the analysis of low-income populations was expanded to include households at 150 percent of poverty level. This analysis found that there is no high and adverse disproportionate impact to low-income and minority populations from the Preferred Alternative. Adverse impacts are not predominately borne by low-income or minority populations. Only 21 percent of the population within the 65 dB DNL contour for the Preferred Alternative is minority, compared to the Suffolk County minority population of 38 percent. Less than two percent of the population within the 65 dB DNL contour for the Preferred Alternative has a household income less than 150 percent of poverty level. The additional area within the 65 dB DNL noise contour associated with the Preferred Alternative includes a predominately Hispanic neighborhood in Chelsea which is predicted under worst case assumptions to experience an increase of 0.6 dB or less. Under FAA standards, this change is not a significant adverse impact. Mitigation of the increased noise within the 65 dB DNL noise contour will be provided to affected communities in the form of residential sound insulation. The minority and low-income populations in South Boston and East Boston affected by the Preferred Alternative 65 dB DNL noise contour are almost identical to the No Action Alternative. The 65 dB DNL noise contour for the Preferred Alternative does not extend into Jamaica Plain, Roxbury and the South End. Mitigation of the increased noise within the 65 dB DNL noise contour will be provided to affected communities in the form of residential sound insulation. Refer to Section 6.8 of the Supplemental DEIS/FEIR for a discussion of the Environmental Justice analysis.

LETTER 351

Dear Mr. Pugsley,

I am a Somerville resident and property owner. I have lived in Somerville since 1986 and I have owned my home in Somerville where I reside since 1992. Since that time I have seen my neighborhood, Brickbottom Artists Building and the surrounding neighborhood along the McGrath Highway, go through tremendous transformation and upgrading. The neighborhood is cleaner, safer, and is populated with community-oriented people.

I am writing to you to express my concern about the proposed runway 14/32 which is expected to triple air traffic over Somerville and have a major impact on the quality of life in this city and of course our property values. I work in audio and know a great deal about decibel levels and noise pollution. I have recently become aware that a formal decibel study has not been conducted for our neighborhood and this is not only
cceptable it is disrespectful and dishonest. Poorer neighborhoods are 351.1
ways expected to bear the brunt of situations such as this and this is wrong. Hanscom field is very underutilized and is far better positioned to support the kind of business traffic that this new runway is supposed to address.

I would also like to cite the following issues as reasons to reject the proposed runway.
1. The study uses old data from 1993 which was the worst year to document delays at Logan
2. Delays at Logan have actually decreased over the last six years. I fly 351.2
several times a year and the only times I have been delayed have been due to inclement weather either in the Boston area or in the area where my plane is coming from.
3. Other strategies for reducing air traffic should be explored such as 351.3
Hanscom Field which is much closer to the Route 128 business area.
4. Adding a runway may actually increase traffic and so nothing will be 351.4
gained. Traffic, either by road or air, is like water - it will fill any space it is given and not necessarily reduce congestion.
5. Noise impact on surrounding communities are grossly underestimated. 351.5
SOMERVILLE HAS NOT HAD AN OFFICIAL DECIBEL STUDY OF NOISE IMPACT! Other areas have.

I urge you sir, to please give serious consideration to these matters and look for other, more fair and more functional solutions to air traffic
nagement.

ncerely,
Ellen Band

Code	Topic 1	Topic 2	Comment	Response
351.1	Environmental Justice	Impacts	Poorer neighborhoods are always expected to bear the brunt [noise impacts] of situations such as this...	Adverse impacts are not predominately borne by low-income or minority populations. Only 21 percent of the population within the 65 dB DNL contour for the Preferred Alternative is minority, compared to the Suffolk County minority population of 38 percent. Less than two percent of the population within the 65 dB DNL contour for the Preferred Alternative has a household income less than 150 percent of poverty level. The additional area within the 65 dB DNL noise contour associated with the Preferred Alternative includes a predominately Hispanic neighborhood in Chelsea which is predicted under worst case assumptions to experience an increase of 0.6 dB or less. Under FAA standards, this change is not a significant adverse impact. The minority and low-income populations in South Boston and East Boston affected by the Preferred Alternative 65 dB DNL contour are almost identical to the No Action Alternative. The 65 dB DNL contour for the Preferred Alternative does not extend into Jamaica Plain, Roxbury and the South End. Mitigation of the increased noise within the 65 dB DNL contour will be provided to affected communities in the form of residential sound insulation. A discussion of the Environmental Justice analysis is presented in Section 6.8 of Supplemental DEIS/FEIR.
351.2	Purpose and Need	Delay	The study uses old data from 1993 which was the worst year to document delays at Logan... Delays at Logan have actually decreased over the last six years....	The Supplemental DEIS/FEIR provides updated information for 1998—the latest year for which actual Logan Airport data are available. 1993 was adopted as the base year when the Airside Improvement studies commenced in 1994. The primary function of the Base Year analysis is to calibrate the airfield operation models and environmental impact models. The benefits and impacts of the action alternatives (Alternatives 1, 1A, 2 and 3) are assessed by comparing these not with the base year, but with Alternative 4, the No-Action Alternative. The planning scenarios for 37.5 and 45 million passengers represent a range of future activity at Logan Airport expected in the 2010 to 2020 time frame. Analysis of 1981 to 90 weather with 1989-98 weather identifies no significant differences in statistical properties. The Supplemental DEIS/FEIR also contains a discussion of the FAA and DOT delay measures and historical data, along with comparisons of Logan Airport with other United States airports. FAA Opsnet delays at Logan Airport peaked in 1993, declined for two years and are rising again. Arrival delays which would be directly affected by Runway 14/32 have risen steadily since 1994.

Code	Topic 1	Topic 2	Comment	Response
351.3	Alternatives	Preferred Alternatives	Other strategies ... should be explored such as Hanscom Field...	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR, specifically considered the role of Hanscom Field in the analysis of regional alternatives. Hanscom Field, which serves as a general aviation reliever airport to Logan Airport, already accommodates a significant number of aircraft operations (183,000 operations in 1998). The Hanscom Field activity includes private, business, charter, and air taxi operations that might otherwise use Logan Airport. Since the Airside Project Draft EIS/EIR was filed, Shuttle America, a newly founded airline, began commercial scheduled operations at Hanscom Field, offering limited turboprop services to short-haul regional markets – Trenton, Buffalo, Hartford (discontinued), Wilmington, Delaware (discontinued), and Greensboro. Shuttle America is also conducting operations between Hanscom and New York LaGuardia Airport. While Massport supports commercial service at Hanscom Field consistent with its established limits (60 seat regulation), Massport believes that Hanscom Field will maintain its role as a major general aviation reliever, and that its geographic proximity to Logan, Worcester Regional and Manchester airports will prevent its development as a significant commercial airport. Additionally, commuter airlines serving Logan Airport are unlikely to move a significant number of flights from Logan Airport to Hanscom Field, since approximately 50 percent of passengers on Logan Airport's commuter flights connect to other Logan Airport flights and a significant number of passengers are travelling to Boston. However, any new commercial service initiatives proposed for Hanscom Field shall be reviewed for consistency with the *Hanscom GEIR* (HGEIR) and its Annual Updates, and shall be considered by the Hanscom Area Town Selectmen (HATS). Refer to Section 2.6 of the Supplemental DEIS/FEIR for a discussion of Hanscom Field.
351.4	Purpose and Need	Airfield Capacity	Adding a runway may actually increase traffic...	The goals of the Airside Project are to reduce delay, increase the airport's efficiency, and improve airfield safety in an environmentally responsible manner. The construction of unidirectional Runway 14/32 would prevent the significant drop in airfield capacity that now occurs during northwest wind conditions. The runway would not increase Logan Airport's normal operating capacity of approximately 120 operations per hour which is available nearly 80 percent of the year, but rather would allow this capacity to be maintained more consistently.
351.5	Alternatives	Runway 14/32	Noise impact on surrounding communities are grossly underestimated....	While equivalent jet operations increase by more than 50 percent from a 1993 base to the future 37.5M High Fleet scenario if the Preferred Alternative is implemented, the appropriate basis for comparison of the Preferred Alternative is the No Action Alternative. Equivalent jet operations would increase by more than 75 percent over the Preferred Alternative if no action were taken. Despite the increase in equivalent jet operations, the Airside analysis indicates that overall noise impacts decline over time with the elimination of Stage 2 aircraft and the replacement of hushkitted Stage 3 aircraft with non-hushkitted Stage 3 aircraft. By allowing aircraft operations to shift from over-land to over-water routings and by providing greater flexibility in the use of Runways 27 and 33L for takeoff, the Preferred Alternative further reduces the highest noise impacts to the close-in neighboring communities. Furthermore, the Supplemental DEIS/FEIR also demonstrates the more equitable balance of noise impacts among communities surrounding Logan Airport that can be achieved with the Preferred Alternative as opposed to the imbalance that occurs today and would occur in the future if no action is taken.

LETTER 352

I am writing to ask you to reject Massport's Environmental Impact Statement for proposed runway 14/32, File # 10458 EOA. Massport's Environmental Impact Statement is grossly inadequate for many reasons. One of the most important is its failure to seriously consider all alternatives. 352.1

Notable among the alternatives that Massport has not considered is limiting the number of small airplanes using Logan Airport. The proposed runway would be solely for such small airplanes; if the number of such planes were limited, any need for the runway would be completely 352.2
`iminated while delays could be simultaneously reduced beyond the
latively small reduction (20%) claimed by Massport for 14/32.

The FAA representative who spoke at the Somerville hearing on April 13, 1999 (John Silva) explained that Massport could limit the number of small airplanes using Logan with FAA permission. However, Massport has not only failed to request such permission, it has (as shown by Massport's Environmental Impact Statement) failed even to seriously consider requesting such permission. It is, of course, impossible to say at this time whether such permission would be granted. But for Massport to have failed even to consider seeking such permission in considering the environmental impact of runway 14/32 is a serious, indeed fatal, flaw in its Environmental Impact Statement, which should be rejected on that basis alone.

The Environmental Impact Statement has other serious flaws, as well. For example, as noted, even Massport concedes that runway 14/32 would eliminate only 20% of delays, and even that only for a few years. But Massport has failed in its Environmental Impact Statement to explain why this small reduction in delays justifies the serious environmental consequences of runway 14/32. Indeed, Massport's Environmental Impact Statement generally discounts the environmental impact on surrounding communities. It assumes that so long as it identifies some nongovernmental gains from runway 14/32, mentions some environmental consequences, and considers some alternatives, it has done all that is necessary. These assumptions directly contravene the purpose of the `ironmental Impact Statement requirement. 352.3 352.4

An Environmental Impact Statement is mandated to make sure that Massport

has adequately considered all of the environmental consequences and all of alternatives, to see if the nongovernmental gains from runway 14/32 really justify those environmental consequences. Massport's Environmental Impact Statement is grossly deficient, and should be rejected.

you have any questions about my comments, please feel free to call me.

Code	Topic 1	Topic 2	Comment	Response
352.1	Environmental Review Process	MEPA	...Environmental Impact Statement is grossly inadequate... most important is its failure to seriously consider all alternatives.	In January 2000, in response to the FAA's review of the Draft EIS, the FAA called for preparation of a Supplemental Draft EIS to address specific issues identified by the FAA following input from a SDEIS Panel consisting of six persons. At the FAA's direction, three SDEIS Panel members were appointed by the Governor of the Commonwealth of Massachusetts and three were appointed by the Mayor of the City of Boston. Under the direction of the New England Region FAA, the SDEIS Panel convened in March of 2000 and then met at least monthly with a final meeting in December of 2000. A total of 12 meetings were held. To provide the appropriate background, the SDEIS Panel was presented with an Interim Supplemental Draft EIS, the Airside Project Draft EIS/EIR, answers to key letters written by members of the public, concerned agencies and public officials responding to the Airside Project Draft EIS/EIR, and a series of 15 visual and written presentations from the Project's technical consulting team and other independent industry experts. The Secretary of Environmental Affairs found that "...the Draft Environmental Impact Report (DEIR) submitted on this project adequately and properly complies with the Massachusetts Environmental Policy Act...". Refer to the Certificate of the Secretary of Environmental Affairs on the DEIR, dated May 7, 1999.
352.2	Alternatives	Other Non-Construction Alternatives	If the number of small planes were limited, any need for the runway would be completely eliminated while delays could be simultaneously reduced beyond the relatively small reduction (20%) claimed by Massport for 14/32.	Regarding caps on airport operations, federal constitutional provisions (preemption, commerce clauses, equal protection), federal aviation statutes and regulations, and contractual provisions related to covenants in connection with the Federal Airport Improvement Program grants which Massport receives, restrict Massport's ability to control the number of aircraft operations at Logan Airport. Massport has undertaken a comprehensive mitigation program, such as Logan Airport Noise Rules, for those areas that fall within its powers as proprietor of Logan Airport, which are not preempted under federal law. The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR contain an analysis of PPP as a demand management alternative at Logan Airport. The analysis indicates that PPP is an effective option when airlines schedule beyond the normal hourly operating capacity of the airport, and provides an assessment of the extent of the benefits from PPP under such circumstances. See Section 4.5 of the Supplemental DEIS/FEIR.

Code	Topic 1	Topic 2	Comment	Response
352.3	Purpose and Need	Delay	....Massport has failed ... to explain why this small reduction in delays justifies the serious environmental consequences of runway 14/32.	The FAA consistently rates Logan Airport as one of the most delay-prone airports in the United States. Logan Airport's estimated annual delay hours are over five times the FAA's threshold of 20,000 hours for a severely delayed airport. The FAA Technical Center simulated Logan Airport operations in 1992 and estimated that when activity reached 504,000 annual operations, total delay would exceed 260,000 hours per year. The Supplemental DEIS/FEIR forecasts delays to increase to 157,500 hours per year when annual operations reach 510,000 with the 29 M Low Fleet scenario. The Supplemental DEIS/FEIR compares the FAA Technical Center delay estimates with those of the Airside Project modeling. The FAA has concluded that the Airside Project delays represent "a plausible and conservative estimate". Based on simulation modeling, Logan Airport experienced 120,000 hours of runway-related delays in 1998. If no actions are taken, runway-related delays are forecast to grow as high as 333,000 hours under a 37.5M High Fleet scenario. The Preferred Alternative produces immediate and long-term benefits by lowering runway delays by 38,000 hours if it had been in place in 1998, and by as much as 94,000 hours in the future 37.5M High Fleet scenario. Because of the impact of the regional alternatives, the 37.5M High Fleet scenario is not expected to be achieved until 2015. The sooner airside efficiencies are implemented; the more benefits will accrue over time. Section 4.6 of the Supplemental DEIS/FEIR shows that delay reduction benefits increase over time as traffic levels increase.
352.4	Cumulative Impacts		....Environmental Impact Statement generally discounts the environmental impact on surrounding communities....	Massport is committed to a number of mitigation measures in addition to project-specific mitigation. Refer to Chapter 8 of the Supplemental DEIS/FEIR for a discussion of mitigation measures.

LETTER 353

We are writing to oppose the new airport runway at Logan, considering its overall impact on our communities to be detrimental.

We have heard and understand the arguments that the future economic health of our communities and region will benefit from the new runway, but disagree. We are not anti-growth, simply anti-irrational-growth. At best, this measure postpones a few short years a more basic decision about the long-term and sustainable growth for the area. And it does so with an unacceptable new burden on the quality of life in surrounding communities. 353.1

It is time to slow down and think deeper about the long term plan here. It seems to us that any rational plan for the future recognizes that:

* Much of the airport traffic at Logan services residents and businesses from cities and towns well outside the metropolitan area, with the associated ground traffic adding to the congestion into and out of Boston. Improved and increased service at regional airports must be part of any serious future plan. That must be planned carefully with the surrounding communities around those airports, obviously. 353.2
* Today's airport needs and those of the future cannot be based on outdated studies. Realistic data is essential. In Somerville, where we live, we understand there have been no systematic sound & noise measurements with which to evaluate current over flights, never mind the proposed and substantial increase that will result from the new runway. 353.3
* The proposed growth in flights over Somverville is unacceptably high. In addition, Somerville will be subjected to increased congestion from a new exit ramp from Route 93 at Sullivan Station--traffic congestion already is a serious problem before it even opens. The community's life will become all the more stressful with the constant increased flight traffic directly overhead. 353.4
* It makes little sense to continue the large number of takeoffs and landings from light aircraft at Logan. Many or most of those flights belong elsewhere. Consolidated routes will alleviate the load. 353.5

It makes no sense to push through a plan that has so many real
r ives, will be so divisive, and at best is a very short-term
s ution. This type of "solution" will reinforce the same inefficient and irrational trends that lead to its proposal in the first place. We

do not want to have to deal with this problem again in a few years' time, after having inflicted us with a lower quality of daily life for our families and neighborhoods.

Government and business decisions of such tremendous consequence cannot be made under the pressure of immediate needs. Sound practice demands a comprehensive long-term approach. This proposed runway will only divert from facing the problem fully.

We do not want our families and neighborhoods to pay the price of such "quick fix" solutions.

Please take our views into account and work for a healthier alternative.

Cordially,

RamÂn A. Bueno
Debra Weisberg

Code	Topic 1	Topic 2	Comment	Response
353.1	Alternatives	Preferred Alternative	...this measure postpones a few short years a more basic decision about the long-term and sustainable growth for the area. And it does so with an unacceptable new burden on the quality of life in surrounding communities.	Based on simulation modeling, Logan Airport experienced 120,000 hours of runway-related delays in 1998. If no actions are taken, runway-related delays are forecast to grow as high as 333,000 hours under a 37.5M High Fleet scenario. The Preferred Alternative produces immediate and long-term benefits by lowering runway delays by 38,000 hours if it had been in place in 1998, and by as much as 94,000 hours in the future 37.5M High Fleet scenario. Because of the impact of the regional alternatives, the 37.5M High Fleet scenario is not expected to be achieved until 2015. The sooner airside efficiencies are implemented; the more benefits will accrue over time. Section 4.6 of the Supplemental DEIS/FEIR shows that delay reduction benefits increase over time as traffic levels increase.
353.2	Regional Transportation	Regional Airports	....Improved and increased service at regional airports must be part of any serious future plan....	Chapter 2 of the Supplemental DEIS/FEIR provides a discussion of the specific role played by the regional transportation alternatives and steps that Massport has taken to foster use of these alternatives. Massport has long recognized and has been a proponent of options to Logan Airport. Together with the regional airports, Massport has implemented a regional strategy to enhance the use of options to Logan Airport. In the Airside Project Draft EIS/EIR, Massport identified up to 7.3 million annual passengers that could be absorbed by regional alternatives that include use of T.F. Green/Providence, Manchester and Worcester Regional airports, as well as the new high-speed rail to New York. In the Supplemental DEIS/FEIR, Massport recognizes that these developments will slow Logan Airport's passenger traffic growth. Logan Airport may not achieve the 37.5 million passenger forecasts until after 2010, but rather closer to 2015, and the 45 million passenger forecasts may not be achieved until after 2020. While regional alternatives can play an important role in reducing the rate of future traffic growth at Logan Airport, they do not address Logan Airport's inability to efficiently accommodate current levels of demand during northwest wind conditions. Runway 14/32, which is designed to correct the problem with Logan Airport's layout, is necessary to correct this deficiency and provides clear benefits at current aircraft traffic levels. These benefits will only increase in the future, even as developments at the regional airports act to reduce the rate of future growth at Logan Airport.

Code	Topic 1	Topic 2	Comment	Response
353.3	Noise	Monitoring	....In Somerville ... there have been no systematic sound and noise measurements with which to evaluate current overflights, never mind the proposed and substantial increase that will result from the new runway.	The Supplemental DEIS/FEIR projects that the Preferred Alternative would promote runway use in a manner that is more consistent with annual PRAS goals, and Somerville is affected most by Runway 33 departures and Runway 15 arrivals. Total departures from Runway 33L and arrivals to Runway 15R would increase, but many of these are non-jets. These runway operating directions are currently running well below their PRAS goals, and the unidirectional Runway 14/32 would allow the controllers to approach but still remain below the annual goals for these operations. The PRAS goals were established based on a thorough public participation process in response to community noise concerns. Additionally, by increasing the number of operations over water, Runway 14/32 would reduce the total annual hours of dwell and persistence over populated areas in accordance with short-term PRAS goals. The Day-Night Sound Level values in Somerville are less than 60 dB for the future scenarios.
353.4	Ground Transportation	Access to Logan	....Somerville will be subjected to increased [traffic] congestion from a new exit ramp from Route 93 at Sullivan Station....	Implementation of the Preferred Alternative would not increase capacity, but rather it would correct a series of deficiencies in the airfield geometry and operation. Massport's plans to handle the ground access requirements of future passenger levels are discussed in the *Logan Airport 1999 ESPR* (previously GEIR) and its subsequent Environmental Data Reports (Annual Updates).
353.5	Regional Transportation	Regional Airports	It makes little sense to continue the large number of takeoffs and landings from light aircraft at Logan. Many or most of those flights belong elsewhere. Consolidated routes would alleviate the load.	Commuter airlines serving Logan Airport are unlikely to move a significant number of flights from Logan Airport to other airports, since approximately 50 percent of passengers of Logan Airport's commuter flights connect to other Logan Airport flights. Federal constitutional provisions, federal aviation statutes and regulations, and contractual provisions related to Federal Airport Improvement Program grants prevent Massport from any control over airline rates, routes, and schedules. Congress has specifically forbidden airport operators from exercising any discriminatory action against any class of airport users. Major factors in airline competition are frequency of service and number of markets served, and Massport has no ability to force airlines to consolidate or eliminate flights to influence load factor or aircraft size.

LETTER 354

Re: File #10458 EOA

Dear Mr. Pugsley:

I am writing to submit comments on MassPORT's Environmental Impact Statement (EIS) issued to obtain approval for construction of runway 14/32 and a new center field taxiway at Logan International Airport. The EIS should be returned to MassPORT as incomplete, as it does not adequately address alternatives to the construction of a new runway nor does it place any real value on the quality of lives of the hundreds of thousands of people who live near Logan Airport. The EIS uses old data from 1993, the worst year for delays in the history of the airport, to justify its position that a new runway is needed. They tell the public that shifting winds cause the delay problem at Logan, when their own numbers show that only around 1 in 5 delays is caused by the wind situation. The EIS simply overstates the problem, fails to address other solutions, and understates the negative effects of another runway on residents who already live with airplane noise as part of their daily lives. 354.1 354.2

I live in Somerville, in the Ten Hills section on the Mystic River. MassPORT continually characterizes the current noise problem in Somerville as "minimal." While I know communities like South and East Boston and Winthrop suffer much more than I do, I can tell you that plane noise is something I live with every day. I can live with it, and I understand that it is simply part of life in an urban area with an airport close by----but I cannot live with three times what I get now. I am a working person in my early 30's, and we bought our house in Somerville last year. I am the type of person that communities want to have as homeowners, yet I will have to move out of Somerville if the plane noise and air pollution is tripled in the wake of the addition of runway 14/32. 354.3

I recommend that MEPA return the EIS to MassPORT and tell them that they simply failed to adequately address all of the necessary issues that must be addressed when you ask an already-overburdened urban community to live with more noise and pollution in the interest of cutting down on a percentage of the delays that currently exist. Thank you for considering my comments.

Sincerely,

Jack Christin, Jr.

354.1	Environmental Review Process	MEPA	....incomplete, as it does not adequately address alternatives to the construction of a new runway ... does [not] place any real value on the quality of lives of the hundreds of thousands of people who live near Logan Airport.	The improvement concepts evaluated in the Airside Project Analysis evolved from prior studies including the FAA's *Logan Capacity Enhancement Plan* (October 1992); the *Logan Runway Incursion Mitigation Plan/Taxiway Relocation Study* (December 1993); the *Logan Final GEIR* (July 1993); and the *Logan Airside Improvements Feasibility Study, Phase 1 Report*, published in July 1995. The FAA evaluated a numerous physical, operational, and administrative concepts for reducing Logan Airport delays in its *Boston Logan International Airport Capacity Enhancement Plan*. The FAA recommended several improvement concepts, including unidirectional Runway 14/32, for further study. These improvement concepts, as well as concepts from other studies, were individually examined by Massport in the *Logan Airside Feasibility Study*, published in July 1995. Based on the Feasibility study, some concepts were rejected and the most promising concepts were combined into the Alternatives considered in the Airside Project Draft EIS/EIR. The alternatives analysis in the Airside Project Draft EIS/EIR is consistent with state and federal scoping directives for the Airside Project. The results of the Airside analysis indicate that alternatives that include unidirectional Runway 14/32 provide the most benefit in terms of delay reduction and ability to achieve PRAS goals. While equivalent jet operations increase by more than 50 percent from a 1993 base to the future 37.5M High Fleet scenario if the Preferred Alternative is implemented, the appropriate basis for comparison of the Preferred Alternative is the No Action Alternative. Equivalent jet operations would increase by more than 75 percent over the Preferred Alternative if no action were taken. Despite the increase in equivalent jet operations, the Airside analysis indicates that overall noise impacts decline over time with the elimination of Stage 2 aircraft and the replacement of hushkitted Stage 3 aircraft with non-hushkitted Stage 3 aircraft. By allowing aircraft operations to shift from over-land to over-water routings and by providing greater flexibility in the use of Runways 27 and 33L for takeoff, the Preferred Alternative further reduces the highest noise impacts to the close-in neighboring communities. Furthermore, the Supplemental DEIS/FEIR also demonstrates the more equitable balance of noise impacts among communities surrounding Logan Airport that can be achieved with the Preferred Alternative as opposed to the imbalance that occurs today and would occur in the future if no action is taken.

Code	Topic 1	Topic 2	Comment	Response
354.2	Purpose and Need	Delay	EIS uses old data from 1993, the worst year for delays in the history of the airport, to justify its position that a new runway is needed....	The projections of future airfield delays at Logan Airport are not based on analysis and modeling of delays which occurred during 1993. The analysis for 1993 was included in the Airside Project Draft EIS/EIR to provide historical perspective to the delay problem at Logan Airport and for use in model calibration. The analysis contained in the Supplemental DEIS/FEIR has been updated to include modeled delay results for 1998 to provide more current context to airfield conditions at Logan Airport. Refer to Section 4.2 of the Supplemental DEIS/FEIR for a description of the delay analysis and discussion of current and future delays at Logan Airport.
354.3	Alternatives	Runway 14/32	I live in Somerville, in the Ten Hills section on the Mystic River. ..... I will have to move out ... if the plane noise and air pollution is tripled in the wake of the addition of runway 14/32.	The Day-Night Sound Level values in Somerville are less than 60 dB for the future scenarios. There should be no new effects on the value of property or unacceptable increase in noise exposure for any of the alternatives. Future scenarios analyzed in this study have to rely on computations rather than measurements, since they occur in the future. However, if you are interested in measuring current conditions in Somerville, you should contact Massport and discuss your ideas. The Supplemental DEIS/FEIR projects that the Preferred Alternative would promote runway use in a manner that is more consistent with annual PRAS goals, and Somerville is affected most by Runway 33 departures and Runway 15 arrivals. No alternatives violate the NAAQS. The Preferred Alternative shows better air quality results than the other alternatives.

LETTER 355

April 19, 1999

Arthur Pugsley

MEPA Unit - Executive Office of Environmental Affairs
100 Cambridge Street, 20th floor
Boston, MA 02202
File 10458 EOA

Dear Mr. Pugsley,

I'm writing to say that I strongly oppose sports proposal to build runway 14/32. I feel that the environmental impact statement that Massport has submitted for review is inadequate and should be rejected. The number one reason Massport has given to have runway 14/32 built is because of the increase in the amounts of delays at Logan. Wail delays at Logan have actually decreased over the last six years. Massport has used old data from 1993, its worst year, to document delays at Logan. I feel that the data that was used in their environmental impact statement is outdated and should be reviewed by an independent review board. Other strategies for reducing delays at Logan are not given due consideration. Such strategies include making greater use of Hanscom Air Field in Bedford, promoting use of Worcester airport by building an access road connecting the facility to the Massachusetts Turnpike and consolidating the disproportionate number of flights of small planes in fewer flights of larger aircraft. Massport has not really addressed the increased congestion in air traffic that runway 14/32 will cause. I feel that Massport is not being honest with people of the communities that will be affected by this runway, they have never directly said that by building this runway there will be a 300% increase in air traffic directly over our communities. As a lifelong resident of Somerville, I feel that our community and surrounding communities were not given any consideration when Massport was compiling its information for its environmental impact statement. I also feel that noise impact on surrounding communities are grossly underestimated. Massport failed to use any data compiled from sound monitors in the Mystic River are between Somerville and Medford, and noise monitors in Everett. Massport has also failed to included in its statement any studies done in communities with graphics made up of hilly areas, and what impact noise would have on those communities. Somerville residence are already barraged with jets and turboprops for days on end, with virtually no letup. The flights typically

355.1

355.2

355.3

began at 6 a.m. and often continue for most or all of the day, until 11 p.m. or even later. The middle of the night flights have become increasingly common. Massport has no night time curfew and one should be implemented. I feel that we are being punished because we chose to live closer to the downtown area. Why does it always seem that the inner urban communities have fight hard to protect their surroundings, while the people in the suburbs el that they should not be affected by such an expansion to Logan airport ...d that there communities should not have to help in taking some of the burden off of the inner urban communities.

I would like to thank you for your time and consideration on this matter.

Sincerely,

Derek C. Dyer

59 Hall Avenue

Somerville, MA 02144

Code	Topic 1	Topic 2	Comment	Response
355.1	Purpose and Need	Delay	....Massport has used old data from 1993, its worst year, to document delays at Logan....	The projections of future airfield delays at Logan Airport are not based on analysis and modeling of delays which occurred during 1993. The analysis for 1993 was included in the Airside Project Draft EIS/EIR to provide historical perspective to the delay problem at Logan Airport and for use in model calibration. The analysis contained in the Supplemental DEIS/FEIR has been updated to include modeled delay results for 1998 to provide more current context to airfield conditions at Logan Airport. Refer to Section 4.2 of the Supplemental DEIS/FEIR for a description of the delay analysis and discussion of current and future delays at Logan Airport.
355.2	Alternatives	Preferred Alternative	Other strategies for reducing delays at Logan are not given due consideration:...	The improvement concepts evaluated in the Airside Project Analysis evolved from prior studies including the FAA's *Logan Capacity Enhancement Plan* (October 1992); the *Logan Runway Incursion Mitigation Plan/Taxiway Relocation Study* (December 1993); the *Logan Final GEIR* (July 1993); and the *Logan Airside Improvements Feasibility Study, Phase 1 Report*, published in July 1995. The FAA evaluated a numerous physical, operational, and administrative concepts for reducing Logan Airport delays in its *Boston Logan International Airport Capacity Enhancement Plan.* The FAA recommended several improvement concepts, including unidirectional Runway 14/32, for further study. These improvement concepts, as well as concepts from other studies, were individually examined by Massport in the *Logan Airside Feasibility Study*, published in July 1995. Based on the Feasibility study, some concepts were rejected and the most promising concepts were combined into the Alternatives considered in the Airside Project Draft EIS/EIR. The alternatives analysis in the Airside Project Draft EIS/EIR is consistent with state and federal scoping directives for the Airside Project. The results of the Airside analysis indicate that alternatives that include unidirectional Runway 14/32 provide the most benefit in terms of delay reduction and ability to achieve PRAS goals.

Code	Topic 1	Topic 2	Comment	Response
355.3	Noise	Impacts	....noise impact on surrounding communities [is] grossly underestimated. Massport failed to use any data compiled from sound monitors in the Mystic River are[a] between Somerville and Medford, and noise monitors in Everett....	Differences between measured and modeled sound levels have been reported in Logan Airport's various GEIRs and Annual Updates for a number of years. Differences at close-in locations were significantly reduced in 1996 through modification of source levels to better account for over-water sound propagation and apparent use of higher engine power settings than are normally assumed in the noise model's database (Refer to Appendix F of the *Logan Airport 1996 Annual Update).* In 1998, differences between measured and modeled noise became even less when Massport upgraded its monitoring system and began to report noise caused only by aircraft -- a metric directly comparable to the DNL exposure levels predicted by the noise model. At sites having exposure levels of 60 dB or more, this improvement to the monitoring system brought measured and modeled DNL values to within 0.2 dB of each other. (Refer to Chapter 6 of the *Logan Airport 1999 ESPR* (previously GEIR)). Massport continues to investigate possible causes for remaining differences (such as from hill effects) and continues to pursue FAA approval of noise model adjustments that would permit expansion of its sound insulation program to include the effects of terrain. Massport also expects to extend eligibility lines to include boundaries that follow local streets rather than strict noise contour lines. Nevertheless, Massport continues to believe that the FAA's INM noise model used in the Airside Project noise analyses accurately represents expected noise exposure. To the extent that federal regulations permit and that funding is available, the proposed sound insulation program will include: (i) not only all residences that fall within the Preferred Alternative's 65 dB Day-Night Sound Level contour when compared to the Airside Project's No Action Alternative's 65 dB Day-Night Sound Level contour, but also (ii) Massport and the FAA will continue to sound insulate and work to complete the current 2-year sound insulation program as presented in the *Logan Airport 1999 ESPR.* For the eligible residences, the FAA will fund building code upgrades, to the extent necessary, to implement sound insulation improvements. The Day-Night Sound Level values in Somerville are less than 60 dB for the future scenarios. However, if you are interested in measuring current conditions in Somerville, you should contact Massport and discuss your ideas. The Supplemental DEIS/FEIR projects that the Preferred Alternative would promote runway use in a manner that is more consistent with annual PRAS goals, and Somerville is affected most by Runway 33 departures and Runway 15 arrivals. Total departures from Runway 33L and arrivals to Runway 15R would increase, but many of these are non-jets. These runway operating directions are currently running well below their PRAS goals, and the unidirectional Runway 14/32 would allow the controllers to approach but still remain below the annual goals for these operations. The PRAS goals were established based on a thorough public participation process in response to community noise concerns. Additionally, by increasing the number of operations over water, Runway 14/32 would reduce the total annual hours of dwell and persistence over populated areas in accordance with short-term PRAS goals.

LETTER 356

Robert Durand, Secretary
MEPA Unit
Attention: Arthur Pugsley

Dear Mr. Durand --

I am writing you to urge you to oppose the Logan runway 14/32 proposal. As a resident of Somerville who already deals with noise from both MBTA/Amtrak and the current air traffic from Logan, I cannot understand how a plan which according to Massport will increase the air traffic over Somerville by 300% or more, can be considered fair. I own a loft in the Brickbottom Artists' building and do not want to see the value of my property decline, nor do I need the added noise that will most certainly affect the quality of my life. As understand it, an official decibel study has not been performed Somerville even though noise levels considered to be nuisance levels have been recorded by Aldermen in Somerville. Please oppose this proposal.

356.1

thanks,

Anthony W. Espy

356.1	Noise	Impacts	...added noise ... will most certainly affect the quality of my life.	The Supplemental DEIS/FEIR projects that the Preferred Alternative would promote runway use in a manner that is more consistent with annual PRAS goals, and Somerville is affected most by Runway 33 departures and Runway 15 arrivals. Total departures from Runway 33L and arrivals to Runway 15R would increase, but many of these are non-jets. These runway operating directions are currently running well below their PRAS goals, and the unidirectional Runway 14/32 would allow the controllers to approach but still remain below the annual goals for these operations. The PRAS goals were established based on a thorough public participation process in response to community noise concerns. Additionally, by increasing the number of operations over water, Runway 14/32 would reduce the total annual hours of dwell and persistence over populated areas in accordance with short-term PRAS goals. Future scenarios analyzed in this study have to rely on computations rather than measurements, since they occur in the future. However, if you are interested in measuring current conditions in Somerville, you should contact Massport and discuss your ideas.

LETTER 357

Robert Durand, Secretary
MEPA unit - Executive Office of Environmental Affairs
100 Cambridge St., 20th floor
Boston, Ma 02202

To whom it may concern,

I attended a meeting at Somerville City Hall to discuss the proposed runway expansion 14/32 at Logan airport. I learned then, that according to their own records, this expansion, in spite of obfuscating rhetoric to the contrary, will result in a 300% increase in air traffic over Somerville!

This is completely unacceptable to me as a resident and a homeowner. I was shocked to hear that Massport intends to do this. This will lower our property values and increase noise pollution here in Somerville to an unacceptable level. I was also shocked to hear that no actual decibel reading has been done in the area to determine the impact on our community. One of the Alderman at the meeting has done a recording of decibel levels on Prospect hill that were well over 65 level considered necessary to warrant an actual citywide reading (I think the reading was in the 115 range). Given this kind of data how can Massport even conceive of tripling air traffic over Somerville without considering the actual impact. The answer may be that they don't want to consider the actual impact. They want the runway despite the heavy cost surrounding communities will have to pay. It is empirically clear, even without noise data, that it would be unfair and environmentally and economically devastating to property values and the business renaissance here to triple air traffic over Somerville. Why should Somerville be singled out for such a burden for the proposed flight pattern change? 357.1

This study is flawed for a number of reasons:

1) It uses old data from 1993 - it's worst year - to document delays at Logan. I understand delays are the major rationale for runway 14/32. 357.2
2) Delays have actually decreased over the past six years. 357.3
3) Other strategies for reducing delays at Logan haven't been given due consideration. Worcester, Concord, N.H., New Bedford, Providence, RI, and Hanscom Field airports could be expanded to accommodate any flight increases. An access road could be built to connect Worcester airport to the MA pike. 357.4
4) Increased congestion in car traffic that runway 14/32 will cause is not addressed. 357.5
5) Noise impact in Somerville and surrounding communities is grossly underestimated. 357.6

In Summary this proposed change will be devastating to Somerville residents who will bear the brunt of the change. It targets Somerville for a disproportionate increase in air traffic that will certainly lower the potential for property value growth as well as the ability of it's residents to experience their right to quiet enjoyment of their property and community.

There is no environmental or human reason to find Massport 's Environmental Impact Statement anything other than grossly inadequate.

Sincerely,

Tighman Evans 1 Fitchburg St. Somerville 02143

357.1	Alternatives	Runway 14/32	...This will lower our property values and increase noise pollution here in Somerville to an unacceptable level. ...no actual decibel reading has been done in the area to determine the impact on our community....	The Day-Night Sound Level values in Somerville are less than 60 dB for the future scenarios. There should be no new effects on the value of property or unacceptable increase in noise exposure for any of the alternatives. Future scenarios analyzed in this study have to rely on computations rather than measurements, since they occur in the future. However, if you are interested in measuring current conditions in Somerville, you should contact Massport and discuss your ideas.
357.2	Delay	Model	It uses old data from 1993--its worst year--to document delays at Logan. I understand delays are the major rationale for runway 14/32.	In response to the request made by the EPA, as well as by EOEA in its MEPA Certificate on the Draft EIR, the Supplemental DEIS/FEIR includes delay and environmental analyses for 1998 to reflect current conditions and to provide context to the delay problem at Logan Airport. However, it should be noted that the appropriate comparison for assessing future year conditions and the effectiveness of the Airside Project, is a comparison of the Preferred Alternative to the No Action Alternative, not a comparison of the Preferred Alternative to the base year. A discussion of current and historic conditions can be found in Section 4.2 of the Supplemental DEIS/FEIR.
357.3	Purpose and Need	Delays	Delays have actually decreased over the past six years.	Logan Airport flight delays, as measured by the FAA, did decline between 1993 and 1997. Nevertheless, the same data show that Logan Airport was consistently ranked as one of the nation's most delayed airports throughout this period. In 1998, delayed flights at Logan Airport, as reported by the FAA increased by more than 30 percent, and continued to increase in 2000. In 2000, Logan was the second most delayed airport for arrivals in the U.S. This represents the worst delay ranking in Logan's history. There are three reasons for the decline in delays between 1993 and 1997. First, in 1997, the number of hourly scheduled flights was less than Logan Airport's normal operating capacity of 120 flights per hour, unlike 1993, when airlines scheduled flights well beyond Logan Airport's hourly capacity. Second, Logan Airport's hourly demand profile is flatter than it was in 1993. Airlines are spreading scheduled flights throughout the day taking advantage of Logan Airport's off-peak hours (*e.g.*, 10 AM to 1 PM). Finally, airlines are carrying more passengers per flight. In fact, with roughly the same number of flights as in 1993, Logan Airport accommodated over 3 million more passengers. One reason for this is that the regional carrier network serving New England is more efficient. In 1993, there were three regional carrier systems serving 2.1 million regional passengers at Logan Airport. Since 1994, Logan Airport has been served by two regional airline systems (Business Express, now American Eagle, and US Airways Express). These carriers handled 2.2 million Logan Airport passengers in 1998.

Code	Topic 1	Topic 2	Comment	Response
357.4	Regional Transportation	Regional Airports	Other strategies for reducing delays at Logan haven't been given due consideration. Worcester, Concord, NH, New Bedford, Providence, RI and Hanscom Field airports could be expanded to accommodate any flight increases. An access road could be built to connect Worcester airports the Mass Pike.	Chapter 2 of the Supplemental DEIS/FEIR provides a discussion of the specific role played by the regional transportation alternatives and steps that Massport has taken to foster use of these alternatives. Massport has long recognized and has been a proponent of options to Logan Airport. Together with the regional airports, Massport has implemented a regional strategy to enhance the use of options to Logan Airport. In the Airside Project Draft EIS/EIR, Massport identified up to 7.3 million annual passengers that could be absorbed by regional alternatives that include use of T.F. Green/Providence, Manchester and Worcester Regional airports, as well as the new high-speed rail to New York. In the Supplemental DEIS/FEIR, Massport recognizes that these developments will slow Logan Airport's passenger traffic growth. Logan Airport may not achieve the 37.5 million passenger forecasts until after 2010, but rather closer to 2015, and the 45 million passenger forecasts may not be achieved until after 2020. While regional alternatives can play an important role in reducing the rate of future traffic growth at Logan Airport, they do not address Logan Airport's inability to efficiently accommodate current levels of demand during northwest wind conditions. Runway 14/32, which is designed to correct the problem with Logan Airport's layout, is necessary to correct this deficiency and provides clear benefits at current aircraft traffic levels. These benefits will only increase in the future, even as developments at the regional airports act to reduce the rate of future growth at Logan Airport. Massport reports on the status of the New Bedford Airport Project in Section 2.6 of the Supplemental DEIS/FEIR. Worcester Regional Airport has existing terminal and airport infrastructure and has been targeted for increased use and future service expansion. MassHighway is in the process of beginning the preparation of the Airside Project Draft EIS/EIR for highway improvements to improve access to Worcester Regional Airport.
357.5	Ground Transportation	Access to Logan	Increased congestion in car traffic that runway 14/32 will cause is not addressed.	The Preferred Alternative is not expected to lead to an increase in passenger demand, and therefore, it will have no effect on congestion or delays on Boston area highways. Refer to Section 4.2 of the Supplemental DEIS/FEIR.

Code	Topic 1	Topic 2	Comment	Response
357.6	Analysis Assumptions/ Methodologies	Noise Model	Noise impact in Somerville and surrounding communities is grossly underestimated.	The Day-Night Sound Level values in Somerville are less than 60 dB for the future scenarios. There should be no new effects on the value of property or unacceptable increase in noise exposure for any of the alternatives. Future scenarios analyzed in this study have to rely on computations rather than measurements, since they occur in the future. However, if you are interested in measuring current conditions in Somerville, you should contact Massport and discuss your ideas. Differences between measured and modeled sound levels have been reported in Logan Airport's various GEIRs and Annual Updates for a number of years. Differences at close-in locations were significantly reduced in 1996 through modification of source levels to better account for over-water sound propagation and apparent use of higher engine power settings than are normally assumed in the noise model's database (Refer to Appendix F of the *Logan Airport 1996 Annual Update*). In 1998, differences between measured and modeled noise became even less when Massport upgraded its monitoring system and began to report noise caused only by aircraft – a metric directly comparable to the DNL exposure levels predicted by the noise model. At sites having exposure levels of 60 dB or more, this improvement to the monitoring system brought measured and modeled DNL values to within 0.2 dB of each other. (Refer to Chapter 5 of the *Logan Airport 1998 Annual Update*). Massport continues to investigate possible causes for remaining differences (such as from hill effects) but believes the FAA's INM noise model used in the Airside Project noise analyses accurately represents expected noise exposure. The Supplemental DEIS/FEIR projects that the Preferred Alternative would promote runway use in a manner that is more consistent with annual PRAS goals, and Somerville is affected most by Runway 33 departures and Runway 15 arrivals. Total departures from Runway 33L and arrivals to Runway 15R would increase, but many of these are non-jets. These runway operating directions are currently running well below their PRAS goals, and the unidirectional Runway 14/32 would allow the controllers to approach but still remain below the annual goals for these operations. The PRAS goals were established based on a thorough public participation process in response to community noise concerns. Additionally, by increasing the number of operations over water, Runway 14/32 would reduce the total annual hours of dwell and persistence over populated areas in accordance with short-term PRAS goals.

LETTER 358

William Falcetano
45 Cherry St.
Somerville, MA. 02144

March 24th, 1999

Mr. Robert A. Durand, Secretary
Executive Office of Environmental Affairs
100 Cambridge Street, Room 2000
Boston, MA 02202

Dear Mr. Durand,

I urge you to oppose Runway 14/32. As a citizen and property owner and taxpayer who has lived in Somerville for the past 15 years, I have noticed a significant increase in air traffic in the past year. The situation has gone from tolerable to absolutely intolerable, with constant air traffic at ALL HOURS OF THE DAY AND NIGHT.

I have been informed that this new runway will increase air traffic over Somerville by two to three hundred percent. This is ABOSOLUTELY UNCONSCIONABLE. How dare MASSPORT impose such a burden on the densely populated areas surrounding the Airport when noise conditions are already deplorable. 358.1

The MASSPORT Environmental Impact Statement does not take any of this into account. Nor does it contain any information concerning the expected increase in *road traffic* to accommodate this increase of air traffic. 358.2

As for their claim to decrease delays, this is actually not true. Many delays will not be decreased as a result of a new runway because they are produced by weather conditions that will affect all runways. Also some delays are caused by delays in other Airports. Finally, even if there is a reduction in the rate of delays this will only last for a short period of time. The new runway is therefore merely a BANDAID SOLUTION. 358.3

We are entitled to a REAL SOLUTION and not a cover-up for increasing the capacity at the airport. That real solution is to build another Airport or expand the use of HANSCOM FIELD, WORCESTER, etc. to accommodate the increase in air traffic. THIS AI A REGIONAL PROBLEM THAT DEMANDS A REGIONAL SOLUTION. 358.4

Besides, the claims that this runway is needed to help the Boston economy are crying wolf and pure exaggeration. Similar claims were made in past years when the Boston economy was booming as it is now.

Finally, the very suggestion that MASSPORT would be able to use its other runways (15/33) aimed as a cannon toward Somerville for non-stop flights over this city is nothing other than a bald threat. It will seriously deteriorate the quality of life here and this is a MAJOR ENVIRONMENTAL IMPACT that must be taken into account.

MASSPORT must seek a regional solution that is equitable for the entire region. In fact air traffic over the Greater Boston METRO area should be decreased as out laying airports take up the slack. That is the real solution and I urge you to oppose this plan.

Sincerely,

William Falcetano

358.1	Noise	Impacts	...this new runway will increase air traffic over Somerville by two to three hundred percent...How dare Massport impose such a burden on the densely populated areas surrounding the airport when noise conditions are already deplorable.	The Day-Night Sound Level values in Somerville are less than 60 dB for the future scenarios. There should be no new effects on the value of property or unacceptable increase in noise exposure for any of the alternatives. Future scenarios analyzed in this study have to rely on computations rather than measurements, since they occur in the future. However, if you are interested in measuring current conditions in Somerville, you should contact Massport and discuss your ideas. The Supplemental DEIS/FEIR projects that the Preferred Alternative would promote runway use in a manner that is more consistent with annual PRAS goals, and Somerville is affected most by Runway 33 departures and Runway 15 arrivals. Total departures from Runway 33L and arrivals to Runway 15R would increase, but many of these are non-jets. These runway operating directions are currently running well below their PRAS goals, and the unidirectional Runway 14/32 would allow the controllers to approach but still remain below the annual goals for these operations. The PRAS goals were established based on a thorough public participation process in response to community noise concerns. Additionally, by increasing the number of operations over water, Runway 14/32 would reduce the total annual hours of dwell and persistence over populated areas in accordance with short-term PRAS goals.
358.2	Ground Transportation	Access to Logan	...[EIS] does [not] contain any information concerning the expected increase in *road traffic* to accommodate this increase of air traffic.	The Preferred Alternative is not expected to lead to an increase in passenger demand, and therefore, it will have no effect on congestion or delays on Boston area highways Refer to Section 4.2 of the Supplemental DEIS/FEIR.
358.3	Purpose and Need	Delays	...Many delays will not be decreased as a result of a new runway because they are produced by weather conditions ... [and] by delays in other airports....	Delays occur when wind or weather conditions require the use of configurations with fewer than three active runways, when poor weather requires increased separation distances between aircraft, or when airlines schedule more flights than Logan Airport can handle. The Airside Project addresses delays from constraints at Logan Airport. Section 1.4 and Appendix C of the Supplemental DEIS/FEIR also contains a detailed discussion of the FAA and U.S. DOT delay measures and historical data, along with comparisons of Logan Airport delays within the context of delays at other United States airports.

Code	Topic 1	Topic 2	Comment	Response
358.4	Regional Transportation	Regional Airports	....real solution is to build another airport or expand the use of Hanscom Field, Worcester, etc....	A second major airport is not a solution to the current delay and congestion problems at Logan Airport. The Proposed Project to reduce delay and enhance safety at Logan Airport must be implemented in the near term to address current and future operating conditions. Even if a second major airport were to be pursued, the planning period for site selection and environmental review would require ten to 15 years, in addition to a multi-year construction period. Rather, Logan Airport is part of a regional system of airports that includes the T.F. Green/Providence, the Manchester, and the Worcester Regional airports. Service development and increased passenger traffic at these airports are an important part of the region's long-term strategy to accommodate passenger and activity growth. Greater use of the regional airports will provide passengers within the service area of such airports with a viable alternative to Logan Airport. Since demand within Logan Airport's primary service area will remain strong, the improvements at other regional airports will not eliminate the need for airside projects at Logan Airport.

LETTER 359

Oratio Conta Strepitare

My name is William Falcetano. I live in Somerville and I teach philosophy at Merrimack College.

I have become involved in this dispute against my will as a result of the sudden and dramatic increase of air traffic noise I and others detected last year about this time. Along with other concerned citizens I took the initiative and started organizing meetings about this problem in December of 1998 before the organization C.A.R.E. had been formed. I shun these kinds of political battles and prefer to live a quiet life of reading, reflection, and study. Nevertheless, this problem has severely interfered with my ability to think, read, write, and pursue the other necessary activities of a college professor.

I have lived in cities all my life and have gotten used to the ambient noise of cars, trucks, pedestrians, kids playing, etc. However, persistent and loud air traffic is an altogether different matter. Since the sudden spike in air traffic over Somerville last year there has rarely been a single moment free from the sound of a jet or plane passing overhead. I hear loud, low-flying air traffic even in the wee hours of the morning – at 2, 3, 4, and 5 AM! Those rare moments of quiet last only for very short periods of time as the traffic picks up again and continues with a dismaying mechanical persistency. Noise produced by neighbors talking, passing by, or playing is usually short-lived due to the limitations of the human voice, fatigue, distraction, etc. But mechanical noise is an altogether different matter; it has a relentless and superhuman resilience that does not offer any hope of relief. This is one reason why towns and cities have noise ordinances to prevent inconsiderate neighbors from inflicting this kind of misery on innocent people who simply want to have their right to the quiet enjoyment of their homes and properties respected. We as neighbors are simply asking MASSPORT to respect our rights.

The deleterious effects of noise pollution are well-documented in medical and psychological journals. Noise pollution is a physical assault on the body. Although sound is a physical phenomenon, sound experienced as noise is not only physical but psychological as well. Therefore any attempt to measure *noise* by decibels entirely misses the point that noise is not mere sound, but sound as it is experienced by a living human being. In this case so-called anecdotal evidence cannot be dismissed as though it were irrelevant with a wave of the hand and the smug presentation of numbers that measure sound, because the issue is not about sound but about noise, that is, sound as an experienced phenomenon and not merely as a physical event.

Noise produces high blood pressure, hypertension, stress, fatigue, sleeplessness and its related disorders, such as irritability, disorientation, confusion, and incompetence due to lack of focus and inattention (as a college teacher I know a little bit about lack of focus and inattention). Recent studies have shown that undue and distracting noise also interferes with the ability of children to concentrate at school. Noise from airplane traffic prevents people from being heard in their own homes, from talking on the telephone, from listening to the radio or television, from reading, thinking, praying, playing musical instruments, or any other activity that requires mental concentration or intellectual focus. It can even distract from intimate moments of love-making and caressing.

In addition to the dramatic and unhealthful increase of noise (estimated at over 300% in some areas) there is the question of the additional air pollution that will be caused by the increasing air traffic made possible by this ill-conceived scheme. The air

359.1

quality over the Greater Boston area is not very good; and recent reports have shown that big power plants have not complied with their promises to convert to natural gas. They continue to produce excessive air pollution as a result of their slothful and irresponsible reliance on oil, a dirtier fuel. The greater traffic permitted by the new tunnels and the Big Dig will also make an adverse contribution to the deterioration of Boston's air quality. This is not to mention the increasing automobile traffic caused by happy passengers thronging to use the planes supposedly now able to fly on schedule onto and away from the new runway and along the new taxiway. The net effect of this kind of thoughtless air pollution is increasing rates of asthma, laryngitis, lung cancer, bronchitis, sinusitis, emphysema, sore throats and common colds. Besides its effects on human beings air pollution has deleterious effects plants, animals, and property. Yet MASSPORT'S EIR states very little or nothing about these effects on birds, dogs, cats, trees, shrubs, insects, and human beings. And shockingly it says absolutely nothing about the negative effects on roads and mass transportation that will be caused by this wrong-headed and heedless plan.

359.1 (cont.)

359.2

In sum MASSPORT'S EIR is completely inadequate and unsatisfactory. I urge you therefore to refuse MASSPORT'S request to go ahead with this unfair and injurious scheme to inflict even more suffering and hardship on communities that already endure a disproportionate burden of noise, air pollution, and traffic.

Thank you very much for your kind consideration.

359.1	Air Quality	Impacts	In addition to the dramatic and unhealthful increase in noise (estimated at over 300% in some areas) there is the question of the additional air pollution that will be caused by the increasing air traffic....	No alternatives violate the NAAQS. The Preferred Alternative shows better air quality results than the other alternatives.
359.2	Ground Transportation	Access to Logan	....[the EIR] says absolutely nothing about the negative effects on roads and mass transportation that will be caused by this wrong-headed and heedless plan.	The Preferred Alternative is not expected to lead to an increase in passenger demand, and therefore, it will have no effect on congestion or delays on Boston area highways. Refer to Section 4.2 of the Supplemental DEIS/FEIR.

LETTER 360

Robert Durand, Secretary
MEPA Unit - Executive Office of Environmental Affairs
Attention: Arthur Pugsley, File #10458 EOA
100 Cambridge Street, 20th Floor
Boston MA 02202

Dear Secretary Durand:

The proposal to add runway 14-32 at Logan airport concerns me for several reasons. I am a Somerville resident and the proposal shifts more flights over my home. I am trained in the sciences to question assumptions – my Ph.D. is in Physics from MIT – and I have followed the public debate very carefully. I have also reviewed Massport's Environmental Impact Statement and feel strongly that Massport has not presented the true impact on the community and the environment.

The Massport Environmental Impact Statement clearly assumes that air traffic will increase at Logan. Massport seeks to alleviate potential increase in delays by building runway 14-32, building a new taxiway and lowering the decision height for aircraft over East Boston. The proposal addresses the issue of delays in only the narrowest terms – short term, only 25% of the wind problem – and does not provide a comprehensive solution.

As a citizen I must question Massport's proposal and compare it to what common sense suggests.

Common sense suggests sending more flights over the ocean where no people live

Massport proposes limiting runway 14-32 to one direction – over the ocean. However this claim is specious since runway 14-32 is only 5,000 feet and will be used by smaller aircraft. **These aircraft will not be heading to Europe but will rapidly turn to their mostly regional headings impacting many communities surrounding Boston.** 360.1

Common sense suggests sending the most flights over the areas with the fewest people

Massport claims that the number of people affected by the new runway is small. Their calculations follow FAA guidelines to determine the numbers of people impacted by noise. People within an area of noise "pressure" of 65 decibels or above on average are impacted. This is a level of noise where two people having a normal conversation would be unable to hear each other. The FAA declares uninhabitable areas where this noise level is introduced unless the housing in the area is "mitigated".

What is most disturbing is the fact that the model Massport uses in the noise calculations assumes that the topography of the entire region is flat. No hills in Somerville, where the planes pass very low, are included. Nor has Massport placed noise monitors in Somerville to test their model. **This misrepresentation alone is reason enough to reject the application.** 360.2

Additionaly, Massport is changing its flight patterns to "share the burden". Again, first appearance is that some neighborhoods, cities and towns will have similar numbers of overflights. **Unstated is that many individuals will experience increased overflights of 100% to 300%.**

The communities that will experience these huge increases are in fact our most populous – Somerville, Everett, Chelsea, Roxbury and Roslindale. Massport is sending additional planes over the greatest concentration of people. The more pertinent analysis requires adding up the number of overflights times the number of residents in each city and town. We discover that the total Community Burden is higher with the new runway proposal than without the runway. **Massport has increased the burden to the entire Boston community.**

Common sense suggests reducing the total number of Logan flights

Smaller craft are the most significant cause of all delays at Logan. A previous experiment in pricing structure significantly reduced delays by making it more expensive for smaller planes and they used Logan less. That successful experiment has never been implemented as a policy. **Diverting smaller aircraft or consolidating them into larger craft is an issue that must be addressed before any new runways are created.** 360.3

Common sense suggests that planning major changes requires a long term view

Massport has presented an incomplete, inaccurate and short term proposal. Logan does not operate in a vacuum. The growth in the entire region drives growth at Logan and other regional airports. Since large numbers of people will be affected, any proposal must be comprehensive. **Massport's piecemeal approach is inadequate and unworthy of a planning authority.**

The Massachusetts Port Authority's proposal for runway 14-32 will increase the burden on individuals. The proposal will increase the burden on the Boston community. The proposal fails to address regional solutions. I urge you to reject the Massport's Environmental Impact Statement as inadequate and deficient.

Very truly yours,

Irving Fischman, Ph.D.

360.1	Alternatives	Unidirectional	Massport proposes limiting runway 14/32 to one direction--over the ocean. However, this claim is specious since runway 14/32 is only 5,000 feet and will be used by smaller aircraft. ...[that] will rapidly turn to their mostly regional headings impacting many communities surrounding Boston.	Massport and the FAA are committed to using Runway 14/32 in a unidirectional manner, with aircraft arriving from and departing to the southeast over Boston Harbor. See the discussion of mitigation in Chapter 8 of the Supplemental DEIS/FEIR.
360.2	Noise	Model	What is most disturbing is the fact that the model Massport uses in the noise calculations assumes that the topography of the entire region is flat. No hills in Somerville, where the planes pass very low, are included. Nor has Massport placed noise monitors in Somerville to test their model. This misrepresentation alone is reason enough to reject the application.	When this Supplemental DEIS/FEIR was initiated, there was no noise model in existence that could address topography, and even current versions of noise models greatly simplify calculations incorporating terrain adjustments. Thus, Massport used the best available technology at the time -- a noise model developed by FAA Headquarters, with modifications adapted by Massport and approved by FAA to accommodate over-water sound propagation unique to Logan Airport's noise environment. The model is described in Section 5.2 of the Supplemental DEIS/FEIR.
360.3	Alternatives	Peak Period Pricing	...A previous experiment in pricing structure significantly reduced delays. ....Diverting smaller aircraft or consolidating them into larger craft is an issue that must be addressed before any new runways are created.	Section 4.5 of the Supplemental DEIS/FEIR provides an updated discussion of PPP at Logan Airport and an analysis of the implications of an illustrative conceptual small community exemption program. PPP was included among the Airside Project alternatives to address delays caused by over-scheduling. The potential impact of PPP on the fleet mix at Logan Airport is discussed in Section 4.5.2 of the Supplemental DEIS/FEIR. Section 4.5.3 of the Supplemental DEIS/FEIR provides an analysis of a PPP Exemption program.

Dear Mr. Durand:

You must not support Massport's plan to build Runway 14/32.

Increasing air traffic 300% will significantly impact the quality of life for thousands of people in the Charlestown/Somerville area. 361.1

It will be impossible to enjoy the comfort of uninterrupted sleep, to sit in your yard or on your porch and engage in quiet conversation, or to have open windows winter or summer without the constant rumble and scream of jet engines.

Is not the quality of life for the people who live, work and vote here more important?

Sincerely,

Al Fisher

361.1	Noise	Impacts	Increasing air traffic 300% will significantly impact the quality of life for thousands of people in the Charlestown/Somerville area.	The Day-Night Sound Level values in Somerville are less than 60 dB for the future scenarios. The Supplemental DEIS/FEIR projects that the Preferred Alternative would promote runway use in a manner that is more consistent with annual PRAS goals, and Somerville is affected most by Runway 33 departures and Runway 15 arrivals. Total departures from Runway 33L and arrivals to Runway 15R would increase, but many of these are non-jets. These runway operating directions are currently running well below their PRAS goals, and the unidirectional Runway 14/32 would allow the controllers to approach but still remain below the annual goals for these operations. The PRAS goals were established based on a thorough public participation process in response to community noise concerns. Additionally, by increasing the number of operations over water, Runway 14/32 would reduce the total annual hours of dwell and persistence over populated areas in accordance with short-term PRAS goals.

I would like to express my strong objection to the construction of Runway 14/32 before alternatives have been thoroughly studied. In addition, as a resident of Somerville, I am concerned about the increase in noise that this runway will cause. This noise increase could cause a severe negative impact on the quality of life in Somerville and needs to be carefully studied. Thank you for your consideration

LETTER 363

Mr. Arthur Puxley
EOEA #10458
100 Cambridge Street
Boston, MA 02202

Dear Mr. Puxley:

RE: Proposed Runway 14/32 at Logan Airport

I have read considerably on the above topic in an effort to understand why MASSPORT wishes to build a runway called 14/32. There are numerous inconsistencies in MASSPORT's arguments in favor of this runway. I want to highlight a few:

MASSPORT misleads the public when it claims that Logan has "notorious delays". Since 1992, delays at Logan have gone down according to data from the Federal Aviation Administration's 1998 ACE (Airport Enhancement Capacity) Report. By using exceedingly high "maximum capacity" goals, MASSPORT inflict such delays on their own customers. Located in such a densely populated area, MASSPORT's maximum capacity goals should be 90 rather than 120 planes per hour. When questioned about the reduction in delays, MASSPORT's Director of Aviation admitted **only 20% of delays are due to lack of runway space, the remaining being weather related** (Meeting of Aldermen, Somerville, 99/4/14). Thus, only 20% of delays will potentially be improved by having another runway. 363.1

Furthermore, in MASSPORT's Environmental Impact Study (EIS, one of the findings states that **any delay reduction by this proposed runway would only be effective until 2003 i.e. four years.** So, we spend all this money, increase the noise pollution, upset and disruption to local communities for such a small gain.

At the present time, according to the Director of Aviation, larger aircraft cannot taxi at the same time along the two runways and ramps they have due to long wing span. Yet, MASSPORT have promised that they will only be using the new runway for smaller aircraft arriving and taking off over the ocean thus freeing up the other two runways. **Freeing up the other two runways is irrelevant** if larger aircraft are hampered by wingspan. Can MASSPORT honestly say they will restrict themselves to smaller aircraft on the new runway?

What's extremely troubling about the EIS is its **total disregard for the noise pollution impact on people living in the surrounding communities.** There is absolutely no analysis of how the proposed runway will affect people. 363.2

What's extremely troubling about the EIS is its **total disregard for the noise pollution impact on people living in the surrounding communities.** There is absolutely no analysis of how the proposed runway will affect people.

I am astonished that MASSPORT is pursuing this option which **has very little economic benefit to the surrounding communities** and which, by MASSPORT's own admission, will **increase noise pollution considerably** in certain surrounding communities. No economic analysis was done of the loss of market value on properties in the surrounding communities. 363.3

Given the limited vision of their economic analysis, I want you as an elected official of the electorate of this area to listen to the people who live, work, pay taxes in these neighborhoods. There is a vehement cry not to build this shortsighted runway. Also, given the history of MASSPORT's broken promises, **their credibility rating is pretty much zero** so every proposal by MASSPORT should be examined critically.

MASSPORT have shown horrible ineptitude and grave, poor judgment in their analysis of Logan's problems which begs two questions: **is the MASSPORT authority capable of planning the region's air transportation** and if ineptitude is not the problem, then what or who are **the commercial interests who will benefit** from pursuing this ludicrous uneconomic option? It certainly benefits no-one in the Boston metropolitan area. MASSPORT's EIS represents the interests of airlines and airport-related businesses, all of whom stand to make big profits if Logan's overall capacity is increased by runway 14/32. None of these groups care about the impact 14/32 will have on people as few if any of them live in the affected communities and many of the companies are located in other states.

Please reject MASSPORT's EIS, support the present injunction against runway 14/32, and encourage MASSPORT to pursue alternative, responsible ways of handling projected air travel increases.

Thank you,

Angela Healy

363.1	Purpose and Need	Delays	....only 20% of delays will potentially be improved by having another runway.	Based on simulation modeling, Logan Airport experienced 120,000 hours of runway-related delays in 1998. If no actions are taken, runway-related delays are forecast to grow as high as 333,000 hours under a 37.5M High Fleet scenario. The Preferred Alternative produces immediate and long-term benefits by lowering runway delays by 38,000 hours if it had been in place in 1998, and by as much as 94,000 hours in the future 37.5M High Fleet scenario. Because of the impact of the regional alternatives, the 37.5M High Fleet scenario is not expected to be achieved until 2015. The sooner airside efficiencies are implemented; the more benefits will accrue over time. Section 4.6 of the Supplemental DEIS/FEIR shows that delay reduction benefits increase over time as traffic levels increase.
363.2	Noise	Impacts	What's extremely troubling about the EIS is its total disregard for the noise pollution impact on people living in the surrounding communities....	The Day-Night Sound Level values in Somerville are less than 60 dB for the future scenarios. The Supplemental DEIS/FEIR projects that the Preferred Alternative would promote runway use in a manner that is more consistent with annual PRAS goals, and Somerville is affected most by Runway 33 departures and Runway 15 arrivals. Total departures from Runway 33L and arrivals to Runway 15R would increase, but many of these are non-jets. The PRAS goals were established based on a thorough public participation process in response to community noise concerns. Additionally, by increasing the number of operations over water, Runway 14/32 would reduce the total annual hours of dwell and persistence over populated areas in accordance with short-term PRAS goals.
363.3	Alternatives	Preferred Alternative	....No economic analysis was done of the loss of market value on properties in the surrounding communities.	The Day-Night Sound Level values in Somerville are less than 60 dB for the future scenarios. There should be no new effects on the value of property or unacceptable increase in noise exposure for any of the alternatives. Future scenarios analyzed in this study have to rely on computations rather than measurements, since they occur in the future. However, if you are interested in measuring current conditions in Somerville, you should contact Massport and discuss your ideas.

RE: Logan Airport - Addition of New Runway
EOEA #10458

Dear Gentlemen:

I am opposed to the addition of a new runway at Logan Airport. My residence is located in West Somerville, Massachusetts and I work at the United States Courthouse located in the Seaport District of Boston, Massachusetts. 364.1

My residence is located on Boston Avenue in Somerville. Currently, the noise and turbulence from the flights leaving Logan Airport flying over Somerville has created an impact on all residents. For sometime, I have believed that Boston Avenue may be an additional runway for Logan Airport. Many times in the middle of the night I thought a plane was landing on my street. Many of the two or three family homes in my neighborhood are over 60 to 70 years old. We have many elderly and children. An impact of a crash or a fuel accident would destroy our neighborhood in minutes.

I work in the newly created Seaport District. When I wait for the bus at night when I leave work, I have noticed the many planes within minutes of one another circling and landing at Logan Airport. The impact of more planes landing at an additional runway seems incomprehensible.

I do not believe that Massport has shown a genuine interest in trying to create an atmosphere of cooperation or environmental concern for local residents or businesses. I understand the concerns of the Boston financial district and the hopes of tourism dollars and business dollars that would be generated by an addition runway at Logan Airport but because of the lack of good faith of officials at Massport, I do not believe that they should be granted an additional runway or an extension of a runway at Logan Airport.

Sincerely yours,

Suzan Kelly

LETTER 365

Dear Mr. Quinn,

I am writing about the noise of air traffic over my community in Somerville Massachusetts. Since the noise is intolerable. The last Sunday @ 6:30 AM the planes awoke me. I can't imagine what an 8 hour night's sleep would do. At the same time there is the pollution I find particles in the air. I understand that you are in agreement with the Logan Airport as of last Friday. I don't know if this will reduce the delays they are having. Sometimes when we have called the complaint line Logan airport says they are having another runway out. The L33, Somerville, Medford, Winter Hill, so sorry the rest of the noise has to be.

so I can write, right now. I had turn the volume of my T.V. up and down to adjust to the noise. Somerville is already a populated city and during the times of such. An added burden of daily morning and late evening will increase the tension in our lives.

I have fibromyalgia. It is a muscle pain that feels as a deep disorder. I can't keep sleeping to get back to sleep with the pain gnawing our head. Without a linear a routine sleep I feel raw, irritable all the next day.

Many of the living can't will want live in the city... to be near the busy hospitals or plan ahead to an injury. I can't wait for the bus stops but they are too old and the will have to call on the phone or write about the duties they do to commute in our quality of life in Somerville. For Linora, I hope you can keep this city. Thank you.

LETTER 366

Dear Mr. Pugsley,

I saw a notice in the City section of last weekend's Sunday Globe mentioning that public comments were requested by Thursday on the proposed runway 14/32 at Logan Airport.

As a resident of Somerville, I can attest that the airplane noise is already problematic. Although the intensity varies with wind direction (ostensibly), there are sporadic periods of up to a day or more with unconscionably loud aircraft flying directly overhead. At the worst of these occasions, there is actually ground vibration, and I have a few times been roused from sleep early on a Sunday morning. As the weather warms, this problem is exacerbated by open windows. There does not seem to be any night-time limit as to when these planes can fly, as I have even heard them after midnight.

- idea that the overhead traffic would increase three-fold if the runway is built (as I've read in a number of sources) is just too much. No business advantage or flight delay mitigation is worth destroying the quality of life for the residents of metropolitan Boston. How often do you suppose the average person who lives under one of these flight paths boards a plane at logan? I'd be very surprised if it were more than once a year, if that. That even a frequent business traveller might wait fifteen minutes or a half hour on the few trips he or she takes in a week hardly justifies ruining the quiet of 500,000 people, all the time, forever. I am emphatically against the construction of this new runway. Please tell MassPort to spend the money developing a jet that doesn't make any noise. Then they can build all the runways they want.

366.1

Sincerely,

LETTER 367

ALICE ATWOOD MAHONEY / my name ①
ATWOOD STUDIO REALTY Trust / my studio name
ALICE ATWOOD productions Inc. / publishing name

DEAR, 4/20/1999

Att: ARTHUR PUGSLEY, File # 10450 EOA
MEPA Unit - EXECUTIVE OFFICE OF
ENVIRONMENTAL AFFAIRS
ROBERT DURAND - SECRETARY,

THE MASSPORT ENVIRONMENTAL IMPACT STATEMENT (EIR) is inadequate and should be REJECTED by MEPA.

① it used old data from 1993 - its worst year to DOCUMENT DELAYS at LOGAN. (in reverse 14 yrs.) 367.1

② DELAYS at LOGAN HAVE actually DECREASED OVER THE LAST SIX YEARS

③ OTHER STRATEGIES in reducing DELAYS AT LOGAN Have not BEEN given consideration 367.2

① making use of HANSCOM FIELD in BEDFORD, promoting use of WORCESTER Airport, by building an ACCESS ROAD connecting THE FACILITY to MASS. turnpike.

④ INCREASED congestion in TRAFFIC THAT RUNWAY 14/32 will cause is not ADDRESSED. 367.3

⑤ noise impact on surrounding communities

an underestimated. Somerville, unlike other affected areas, has not had an official DECIBEL STUDY of noise impact! noise levels officially considered to be nuisance have been recorded by an ALDERMAN.

367.4

you are not going to increase the air traffic over Somerville by 300% without having done a citywide study, with microphones, as they have in other affected communities, to study the noise impact of airplane over our area.

my studio is in the Brickbottom Artist Bld. C118B northside first floor. We have enough noise as it is now from Train & Highway. And the airplanes now in the air!

thank you Ms. A Mahony

367.1	Purpose and Need	Delay	It uses old data from 1993--its worst year--to document [delays at Logan for runway 14/32]. Delays at Logan have actually decreased over the last six years.	The projections of future airfield delays at Logan Airport are not based on analysis and modeling of delays which occurred during 1993. The analysis for 1993 was included in the Airside Project Draft EIS/EIR to provide historical perspective to the delay problem at Logan Airport and for use in model calibration. The analysis contained in the Supplemental DEIS/FEIR has been updated to include modeled delay results for 1998 to provide more current context to airfield conditions at Logan Airport. Refer to Section 4.2 of the Supplemental DEIS/FEIR for a description of the delay analysis and discussion of current and future delays at Logan Airport. Logan Airport flight delays, as measured by the FAA, did decline between 1993 and 1997. Nevertheless, the same data show that Logan Airport was consistently ranked as one of the nation's most delayed airports throughout this period. In 1998, delayed flights at Logan Airport, as reported by the FAA increased by more than 30 percent, and continued to increase in 2000. In 2000, Logan was the second most delayed airport for arrivals in the U.S. This represents the worst delay ranking in Logan's history. There are three reasons for the decline in delays between 1993 and 1997. First, in 1997, the number of hourly scheduled flights was less than Logan Airport's normal operating capacity of 120 flights per hour, unlike 1993, when airlines scheduled flights well beyond Logan Airport's hourly capacity. Second, Logan Airport's hourly demand profile is flatter than it was in 1993. Airlines are spreading scheduled flights throughout the day taking advantage of Logan Airport's off-peak hours (*e.g.*, 10 AM to 1 PM). Finally, airlines are carrying more passengers per flight. In fact, with roughly the same number of flights as in 1993, Logan Airport accommodated over 3 million more passengers. One reason for this is that the regional carrier network serving New England is more efficient. In 1993, there were three regional carrier systems serving 2.1 million regional passengers at Logan Airport. Since 1994, Logan Airport has been served by two regional airline systems (Business Express, now American Eagle, and US Airways Express). These carriers handled 2.2 million Logan Airport passengers in 1998. Key lessons learned from this are: 1) while PPP might work in conditions of overscheduling, such as the 1993 environment, because there is no sustained period of flight overscheduling at Logan Airport today, PPP would not provide meaningful delay reduction in the current operating environment; and 2) while delays declined from 1993 to 1997, Logan Airport continued to be one of the most delayed airports in the country because, even though carriers were more efficient at scheduling flights, delays caused by wind and weather continued to occur.

Code	Topic 1	Topic 2	Comment	Response
367.2	Regional Transportation	Regional Airports	Other strategies for reducing delays at Logan have not been given consideration. Making use of Hanscom Field in Bedford, promoting use of Worcester Airport, by building an access road connecting the facility to the Mass Pike.	Logan Airport is part of a regional system of airports that includes T.F. Green/Providence, Worcester Regional and Manchester. Massport has long recognized that service development and increased passenger traffic at these airports are an important part of the region's long-term strategy to accommodate passenger and activity growth. Massport has actively encouraged the development of regional airports and full use of other options, including high-speed rail to Logan Airport's largest market, New York. Regional service was examined in Chapter 2 of the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR. This analysis supports the conclusion greater use of the regional airports will provide passengers within the service area of such airports with a viable alternative to Logan Airport. Since demand within Logan Airport's primary service area will remain strong, the improvements at other regional airports will not eliminate the need for airside projects at Logan Airport. Chapter 2 of the Supplemental DEIS/FEIR provides a discussion of the specific role played by the regional transportation alternatives and steps that Massport has taken to foster use of these alternatives. Massport has long recognized and has been a proponent of options to Logan Airport. Together with the regional airports, Massport has implemented a regional strategy to enhance the use of options to Logan Airport. In the Airside Project Draft EIS/EIR, Massport identified up to 7.3 million annual passengers that could be absorbed by regional alternatives that include use of T.F. Green/Providence, Manchester and Worcester Regional airports, as well as the new high-speed rail to New York. In the Supplemental DEIS/FEIR, Massport recognizes that these developments will slow Logan Airport's passenger traffic growth. Logan Airport may not achieve the 37.5 million passenger forecasts until after 2010, but rather closer to 2015, and the 45 million passenger forecasts may not be achieved until after 2020. While regional alternatives can play an important role in reducing the rate of future traffic growth at Logan Airport, they do not address Logan Airport's inability to efficiently accommodate current levels of demand during northwest wind conditions. Runway 14/32, which is designed to correct the problem with Logan Airport's layout, is necessary to correct this deficiency and provides clear benefits at current aircraft traffic levels. These benefits will only increase in the future, even as developments at the regional airports act to reduce the rate of future growth at Logan Airport. Massport supports improved ground access to Worcester Regional, T.F. Green/Providence, Manchester and Logan airports. These projects are discussed in Section 2.9 of the Supplemental DEIS/FEIR. Since passengers do not travel between New England's regional airports, (e.g., passengers do not first go to Manchester Airport before driving to Logan Airport) it is not clear why improved access between the regional airports would generate any benefit.
367.3	Ground Transportation	Access to Logan	Increased congestion in traffic that Runway 14/32 will cause is not addressed.	The Preferred Alternative is not expected to lead to an increase in passenger demand, and therefore, it will have no effect on congestion or delays on Boston area highways. Refer to Section 4.2 of the Supplemental DEIS/FEIR.

Code	Topic 1	Topic 2	Comment	Response
367.4	Noise	Impacts	Noise impact on surrounding communities are underestimated. Somerville, unlike other affected areas, has not had an official decibel study of noise impact? Noise levels officially considered to be nuisance have been recorded by an Alderman.	Differences between measured and modeled sound levels have been reported in Logan Airport's various GEIRs and Annual Updates for a number of years. Differences at close-in locations were significantly reduced in 1996 through modification of source levels to better account for over-water sound propagation and apparent use of higher engine power settings than are normally assumed in the noise model's database (Refer to Appendix F of the *Logan Airport 1996 Annual Update*). In 1998, differences between measured and modeled noise became even less when Massport upgraded its monitoring system and began to report noise caused only by aircraft – a metric directly comparable to the DNL exposure levels predicted by the noise model. At sites having exposure levels of 60 dB or more, this improvement to the monitoring system brought measured and modeled DNL values to within 0.2 dB of each other. (Refer to Chapter 5 of the *Logan Airport 1998 Annual Update*). Massport continues to investigate possible causes for remaining differences (such as from hill effects) but believes the FAA's INM noise model used in the Airside Project noise analyses accurately represents expected noise exposure. The Day-Night Sound Level values in Somerville are less than 60 dB for the future scenarios. However, if you are interested in measuring current conditions in Somerville, you should contact Massport and discuss your ideas.

LETTER 368

Dear Mr. Puglsley:

I am a resident of Somerville and concerned about Massport's EIR.

I would like to see more data collected before Runway 14/32 is approved. The current data we have is outdated and really inadequate. Please consider these factors before you approve Massport's EIR. 368.1

Sincerely,

Panamai Manadee

LETTER 369

Dear Mr. Pugsley:

I am writing this message as a resident of Somerville in strong protest to the proposed building of Runway 14/32 at Logan Airport. The building of this runway will result in a 300% increase in air traffic volume over Somerville. The data used for justifying the building of this runway is out of date - from 1993! A close look at more recent data from Logan shows that air traffic delays have actually decreased over the last decade. 369.1

Also, no official decibel level study of the noise impact on Somerville has been conducted; something that has been done for other communities potentially affected by runway construction. Why is this the case? Is it because Somerville has population largely comprised of ethnic and racial minorities, blue collar workers and others with low income levels? Don't our votes, taxes and quality of life issues matter? 369.2

By the way, how would you like to have continuous air traffic over your house?

Sincerely,
Beth Manaster
One Fitchburg St. #B-250
Somerville, MA 02143

As a constituent, I demand better representation.

Letter 369

369.1	Purpose and Need	Delay	....The data used for justifying the building of this runway is out of date--from 1993! ...	The projections of future airfield delays at Logan Airport are not based on analysis and modeling of delays which occurred during 1993. The analysis for 1993 was included in the Airside Project Draft EIS/EIR to provide historical perspective to the delay problem at Logan Airport and for use in model calibration. The analysis contained in the Supplemental DEIS/FEIR has been updated to include modeled delay results for 1998 to provide more current context to airfield conditions at Logan Airport. Refer to Section 4.2 of the Supplemental DEIS/FEIR for a description of the delay analysis and discussion of current and future delays at Logan Airport.
369.2	Environmental Justice	Impacts	...no official decibel level study of the noise impact on Somerville has been conducted; ....Is it because Somerville has population largely comprised of ethnic and racial minorities, blue collar workers and others with low income levels? ...	The Day-Night Sound Level values in Somerville are less than 60 dB for the future scenarios. However, if you are interested in measuring current conditions in Somerville, you should contact Massport and discuss your ideas. Low income and minority populations were defined in accordance with Federal Executive Order 12898, the U.S. DOT Final Order, and the Council on Environmental Quality's guidance on environmental justice. In addition, the analysis of low-income populations was expanded to include households at 150 percent of poverty level. The data presented are based on the most recently available census data (1990) using Geographic Information System (GIS) technology to analyze impacts at the most detailed level possible. Refer to Sections 6.8.3 and 6.8.5 of the Supplemental DEIS/FEIR for a discussion of the analytical methodology and results, respectively.

LETTER 370

Dear Mr. Pugsley:

I would like to voice my displeasure with the proposed additional runway at Logan International Airport. I am particularly concerned about the substantial increase in air traffic over Somerville that will take place.

As I understand it, a complete impact study has not been done for our city and we will be one of the most effected locations. 370.1

I typically fly out of Logan three to four times a month and I seldom experience non-weather related delays. The infrequent inconvenience of a delay is worth more to me than the frequent noise impact the expansion will create.

Sincerely,

hael Mercadante
1 Fitchburg Street #C518

370.1	Noise	Impacts	....I am particularly concerned about the substantial increase in air traffic over Somerville that will take place. ....The infrequent inconvenience of a delay is worth more to me than the frequent noise impact the expansion will create.	The Supplemental DEIS/FEIR projects that the Preferred Alternative would promote runway use in a manner that is more consistent with annual PRAS goals, and Somerville is affected most by Runway 33 departures and Runway 15 arrivals. Total departures from Runway 33L and arrivals to Runway 15R would increase, but many of these are non-jets. These runway operating directions are currently running well below their PRAS goals, and the unidirectional Runway 14/32 would allow the controllers to approach but still remain below the annual goals for these operations. The PRAS goals were established based on a thorough public participation process in response to community noise concerns. Additionally, by increasing the number of operations over water, Runway 14/32 would reduce the total annual hours of dwell and persistence over populated areas in accordance with short-term PRAS goals.

LETTER 371

967 Broadway
Somerville, MA 02144

April 18, 1999

Arthur Pugsley
MEPA Unit
Executive Office of Environmental Affairs
100 Cambridge St. (20th Floor)
Boston, MA 02202

We are writing to express our opposition to the proposed Logan Airport runway expansion. We here in Somerville are already being disturbed by an increase in air traffic, and tripling the number of flights over our homes would be intolerable.

Not only do we oppose this because of the impact on Somerville, but we think the proposed runway is a bad idea for everyone for the following reasons:

1. The plan does not accurately take into account the burdens and negative impacts on literally hundreds of thousands of people in the Boston metropolitan region. Communities outside of those that border the airport that will suffer tremendously with the increase in noise pollution. Yet Massport has not conducted proper testing of decibel levels in these communities. 371.1

2. The plan does not recognize that we are already at the point of capacity in terms of how much area residents can absorb. Quality of life is not factored into the equation. Noise pollution such as that created by frequent, low-flying aircraft reduces quality of life.

3. Massport has overstated the delay problem through its method of calculating delays.

4. The runway would be a very partial solution to the delay issue at best. Most of the delays at Logan are for reasons that cannot be addressed by a new runway. 371.2

5. The plan is short-sighted. Even according to Massport projections, any delay-alleviating effects would be swamped within a few years by increasing traffic. Merely shifting traffic from one community to another is not a long-term solution.

6. The plan is not regional in nature. There has not been adequate consideration of the region's needs and the fairness of the burdens associated with air traffic. 371.3

7. The proposal and public comment process has been tainted by the collusion between Massport and business interests. Ordinary citizens cannot afford to run a television advertising campaign to promote our interests, but Massport has allowed big corporations to step in and promote the runway expansion idea.

In summary, we are adamantly opposed to the Logan expansion proposal. We urge you to recognize the terrible toll this would take on so many residents in the Greater Boston area, and stand up for the true public interest.

Sincerely,

Elizabeth L. Merrick

Code	Topic 1	Topic 2	Comment	Response
371.1	Noise	Impacts	....Communities outside of those that border the airport that will suffer tremendously with the increase in noise pollution....	Implementation of Runway 14/32 would not result in substantial noise impacts in any community. Rather, it would enable the air traffic controllers to adhere more closely to the PRAS goals and decrease the population that is most severely affected. For example, implementation of the Preferred Alternative will reduce the population affected by Day-Night Sound Level values greater than 70 dB by four percent with the 29 M Low Fleet scenario, by 67 percent with the 37.5 M High Fleet scenario, and by 39 percent with the High Regional Jet Fleet, while increasing the population exposed to Day-Night Sound Level values greater than 65 dB by two percent, zero percent, and three percent for these three fleet scenarios, respectively. Refer to Section 6.2 of the Supplemental DEIS/FEIR and population counts presented in Tables 6.2-3 through 6.2-8 of the Supplemental DEIS/FEIR. The Day-Night Sound Level values in Somerville are less than 60 dB for the future scenarios. The Supplemental DEIS/FEIR projects that the Preferred Alternative would promote runway use in a manner that is more consistent with annual PRAS goals, and Somerville is affected most by Runway 33 departures and Runway 15 arrivals. Total departures from Runway 33L and arrivals to Runway 15R would increase, but many of these are non-jets. These runway operating directions are currently running well below their PRAS goals, and the unidirectional Runway 14/32 would allow the controllers to approach but still remain below the annual goals for these operations. The PRAS goals were established based on a thorough public participation process in response to community noise concerns. Additionally, by increasing the number of operations over water, Runway 14/32 would reduce the total annual hours of dwell and persistence over populated areas in accordance with short-term PRAS goals.
371.2	Purpose and Need	Delay	Massport has overstated the delay problem through its method of calculating delays.	Refer to Section 4.4 of the Supplemental DEIS/FEIR for a discussion on the estimation and modeling of flight delays. It includes a description of FAA and U.S. DOT delay measures and their limitations, an explanation of computer models for estimating flight delays, and historical data on delays at Logan Airport and other major United States airports. The methodology used for the Airside Project includes the effects of constraints at Logan Airport, and produces lower delay estimates than FAA modeling. The FAA approved all the models, which have been validated in previously published studies of Logan Airport.

Code	Topic 1	Topic 2	Comment	Response
371.3	Regional Transportation	Regional Airports	The plan is not regional in nature....	Logan Airport is part of a regional system of airports that includes T.F. Green/Providence, Worcester Regional and Manchester. Massport has long recognized that service development and increased passenger traffic at these airports are an important part of the region's long-term strategy to accommodate passenger and activity growth. Massport has actively encouraged the development of regional airports and full use of other options, including high-speed rail to Logan Airport's largest market, New York. Regional service was examined in Chapter 2 of the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR. This analysis supports the conclusion greater use of the regional airports will provide passengers within the service area of such airports with a viable alternative to Logan Airport. Since demand within Logan Airport's primary service area will remain strong, the improvements at other regional airports will not eliminate the need for airside projects at Logan Airport.

LETTER 372

As a long time resident of Somerville and tax payer, I strongly object to the plan to build Runway 14/ 32. The Massport's Environmental Impact Statement is inadequate and should be rejected by MEPA because :

-1) it uses old data . 372.1

- 2) delays at Logan have actually decreased over the last six years . 372.2

- 3) other strategies should be given consideration, such as more use of Hanscom Field in Bedford and/or promoting Worcester Airport by building connecting road to MA turnpike.

-4) and most important: increased congestion of traffic that runway 14/32 will cause is not addressed!. 372.3

-5) - Somerville has not had an official decibel study of noise impact! 372.4

Please, make the Secretary of the MEPA unit aware of our concerns.

Respectfully, M.Grazia Marzot, 1 Fitchburg St., C-109, SOMERVILLE, MA.02143

Letter 372
M. Grazia Marzot

Code	Topic 1	Topic 2	Comment	Response
372.1	Purpose and Need	Delays	[I]t uses old data...delays at Logan have actually decreased over the last six years.	Logan Airport flight delays, as measured by the FAA, did decline between 1993 and 1997. Nevertheless, the same data show that Logan Airport was consistently ranked as one of the nation's most delayed airports throughout this period. In 1998, delayed flights at Logan Airport, as reported by the FAA increased by more than 30 percent, and continued to increase in 2000. In 2000, Logan was the second most delayed airport for arrivals in the U.S. This represents the worst delay ranking in Logan's history. There are three reasons for the decline in delays between 1993 and 1997. First, in 1997, the number of hourly scheduled flights was less than Logan Airport's normal operating capacity of 120 flights per hour, unlike 1993, when airlines scheduled flights well beyond Logan Airport's hourly capacity. Second, Logan Airport's hourly demand profile is flatter than it was in 1993. Airlines are spreading scheduled flights throughout the day taking advantage of Logan Airport's off-peak hours (*e.g.*, 10 AM to 1 PM). Finally, airlines are carrying more passengers per flight. In fact, with roughly the same number of flights as in 1993, Logan Airport accommodated over 3 million more passengers. One reason for this is that the regional carrier network serving New England is more efficient. In 1993, there were three regional carrier systems serving 2.1 million regional passengers at Logan Airport. Since 1994, Logan Airport has been served by two regional airline systems (Business Express, now American Eagle, and US Airways Express). These carriers handled 2.2 million Logan Airport passengers in 1998. Key lessons learned from this are: 1) while PPP might work in conditions of overscheduling, such as the 1993 environment, because there is no sustained period of flight overscheduling at Logan Airport today, PPP would not provide meaningful delay reduction in the current operating environment; and 2) while delays declined from 1993 to 1997, Logan Airport continued to be one of the most delayed airports in the country because, even though carriers were more efficient at scheduling flights, delays caused by wind and weather continued to occur.

Code	Topic 1	Topic 2	Comment	Response
372.2	Regional Transportation	Regional Airports	[O]ther strategies should be given consideration, ...	The improvement concepts evaluated in the Airside Project Analysis evolved from prior studies including the FAA's *Logan Capacity Enhancement Plan* (October 1992); the *Logan Runway Incursion Mitigation Plan/Taxiway Relocation Study* (December 1993); the *Logan Final GEIR* (July 1993); and the *Logan Airside Improvements Feasibility Study, Phase 1 Report*, published in July 1995. The FAA evaluated a numerous physical, operational, and administrative concepts for reducing Logan Airport delays in its *Boston Logan International Airport Capacity Enhancement Plan*. The FAA recommended several improvement concepts, including unidirectional Runway 14/32, for further study. These improvement concepts, as well as concepts from other studies, were individually examined by Massport in the *Logan Airside Feasibility Study*, published in July 1995. Based on the Feasibility study, some concepts were rejected and the most promising concepts were combined into the Alternatives considered in the Airside Project Draft EIS/EIR. The alternatives analysis in the Airside Project Draft EIS/EIR is consistent with state and federal scoping directives for the Airside Project. The results of the Airside analysis indicate that alternatives that include unidirectional Runway 14/32 provide the most benefit in terms of delay reduction and ability to achieve PRAS goals.
372.3	Ground Transportation	Access to Logan	[I]ncreased congestion of traffic that runway 14/32 will cause is not addressed!	The Preferred Alternative is not expected to lead to an increase in passenger demand, and therefore, it will have no effect on congestion or delays on Boston area highways. Refer to Section 4.2 of the Supplemental DEIS/FEIR.
372.4	Noise	Studies	Somerville has not had an official decibel study of noise impact!	The Day-Night Sound Level values in Somerville are less than 60 dB for the future scenarios. However, if you are interested in measuring current conditions in Somerville, you should contact Massport and discuss your ideas.

LETTER 376

I"m against it. I have lived in somerville all my life and the air traffic is gettting atrocious. It starts at 6:45 am, and can still be heard after 10 PM, and some days I can't even hear my T.V.

I attended a meeting at city hall when some of the Mass Port representatives presented their side. I think the delays need to be defined more throughly and there seems to be some discrepincies in the way they have created their statistics. Everyone that lives in this area knows the winters can be bad. That's just a fact of life that can't be changed by adding more runways. 376.1

When, and if, the new runway goes in, the air traffic is expected to increase by 300%, how could any one want this? And who is going to promis it will never be used a bidirectional manner when it suits the air port?

They taked about a hill effect, that hasn't even been studied, I don't live on a hill and I still hear it! There have never been any noise levels or EPA studies done here, only in near by towns.

The airport increase in flights and traffic will only increase and per Mass Port already be obsolete by 2004, about the time the expressway is completed, what will they do with all that traffic? 376.2

It's good for business is not alwayas good for the neighborhood, our town is just starting to come out of it's slumerville era and this could set us back economicaly. Our home prices will decline and we will be Chealse and East Boston. No boom for them or us. 376.3

I have worked in these area, and have heard all the comments about how long they need to wait to get their houses sound prooffed and some are still not done becasue they are on some sort of a lottery system. Of course this doesn't help you when you are in your yard or standing outside.

But of course, Somerville has already been informed renumberation will not be available to us. Sometimes you can't even carry on a conversation standing outside the house when the airplanes are going overhead, so what good would sound prooffing the house do? 376.4

There are other available sites that could be used and improve if they were to put some effort into it, such as Worcestor. since at least 50% of the people who use the airport come from outside the 495 area, they should also share in the prosperity. 376.5

There is to much concentration of power in Mass Port, what does it take to

stop them?

Find other alternatives. Carol Rego

Letter 376

Code	Topic 1	Topic 2	Comment	Response
376.1	Purpose and Need	Delay	....I think the delays need to be defined more thoroughly and there seems to be some discrepancies in the way they have created their statistics....	Refer to Section 4.4 of the Supplemental DEIS/FEIR for a discussion on the estimation and modeling of flight delays. It includes a description of FAA and U.S. DOT delay measures and their limitations, an explanation of computer models for estimating flight delays, and historical data on delays at Logan Airport and other major United States airports. The methodology used for the Airside Project includes the effects of constraints at Logan Airport, and produces lower delay estimates than FAA modeling. The FAA approved all the models, which have been validated in previously published studies of Logan Airport.
376.2	Ground Transportation	Access to Logan	The airport increase in flights and traffic will only increase...	The Preferred Alternative is not expected to lead to an increase in passenger demand, and therefore, it will have no effect on congestion or delays on Boston area highways. Refer to Section 4.2 of the Supplemental DEIS/FEIR.
376.3	Alternatives	Preferred Alternative	....Our home prices will decline....	The Day-Night Sound Level values in Somerville are less than 60 dB for the future scenarios. There should be no new effects on the value of property or unacceptable increase in noise exposure for any of the alternatives.
376.4	Noise	Sound Insulation	....what good would soundproofing the house do?	While sound insulation does not mitigate exterior sound levels, it is a widely accepted measure considered appropriate for general mitigation of noise impacts. Sound insulation reduces noise inside the home. While the implementation of the Preferred Alternative would bring additional homes within the criteria for inclusion in the sound insulation program, the inside of these homes will have lower noise levels than they would have had without sound insulation under the No Action Alternative. Measures designed to improve PRAS (i.e., the PRAS monitoring program) are also mitigation measures. Improved achievement of PRAS goals under the Preferred Alternative will further benefit the most highly exposed areas around Logan Airport.

Code	Topic 1	Topic 2	Comment	Response
376.5	Regional Transportation	Regional Airports	There are other available sites that could be used ... such as Worcester....	Since 1995, Massport has worked closely with the City of Worcester to aggressively market the Worcester Regional Airport to airlines. Massport increased its involvement with Worcester Regional Airport by assuming operational responsibility of the airport on January 15, 2000. Since January 2000 Massport has attracted three new airlines to Worcester Regional Airport. Delta Connection began serving Worcester Regional Airport with two daily nonstop roundtrip flights on regional jet aircraft to Atlanta on February 1, 2000 and will be increasing its service to three daily flights in April 2001. On July 6, 2000, American Eagle began service to New York JFK Airport with three daily nonstop roundtrip flights on turboprop aircraft. In February 2001, PanAm began daily scheduled service from Worcester to Orlando International Airport. Massport is in ongoing discussions with other carriers regarding potential new services at Worcester Regional Airport. Since 1995, Massport has worked closely with the City of Worcester to aggressively market the Worcester Regional Airport to airlines. Massport increased its involvement with Worcester Regional Airport by assuming operational responsibility of the airport on January 15, 2000. Since January 2000 Massport has attracted three new airlines to Worcester Regional Airport. Delta Connection began serving Worcester Regional Airport with two daily nonstop roundtrip flights on regional jet aircraft to Atlanta on February 1, 2000 and will be increasing its service to three daily flights in April 2001. On July 6, 2000, American Eagle began service to New York JFK Airport with three daily nonstop roundtrip flights on turboprop aircraft. In February 2001, PanAm began daily scheduled service from Worcester to Orlando International Airport. Massport is in ongoing discussions with other carriers regarding potential new services at Worcester Regional Airport. In addition to the Worcester Regional Airport, Massport has pursued a variety of initiatives to promote the use of other regional airports and travel modes with the goal of relieving traffic growth pressures at Logan Airport. For example, in November 1999, Massport and Governor Cellucci co-sponsored a Regional Transportation Summit of the New England Governors and transportation officials. The Summit focused on joint marketing among the New England commercial service airports and the joint promotion of rail and road initiatives that will foster an efficient and balanced regional transportation system. A second summit was held in Rhode Island in December 2000. Refer to Chapter 2 of the Supplemental DEIS/FEIR for a comprehensive discussion of Massport's regional transportation planning initiatives. Massport disagrees that its record in diverting traffic to other airports is unsuccessful. Since 1996 eight out of ten new passengers in New England were directed to regional airports, which include T.F. Green/Providence, Worcester Regional, and Manchester airports. In 1999, Massport estimates that regional airports attracted 2.4 million passengers, that would have otherwise used Logan Airport.

LETTER 377

61 PRESTON ROAD
SOMERVILLE, MASSACHUSETTS 02143

April 22, 1999

Mr. Robert Durand, Secretary
Executive Office of Environmental Affairs
Attention: Arthur Pugsley, Associate Environmentalist
File #10458 EOEA
100 Cambridge Street, Room 2000
Boston, MA 02202

Dear Mr. Durand:

This letter is in response to the proposal to construct Runway 14/32 at Logan International Airport. I oppose this project on the grounds that (a) the effect on the Somerville community has not been considered, (b) the 65dB threshold to measure the effect on residents in the flight path is not reflective of the actual consequences of the noise, vibration, and trauma of overflights on human health, (c) the full effect of changes at regional airports drawing traffic away from Logan has not been factored into the plan, (d) delays have not been appropriately measured, and (e) other means to consolidate passengers and "levelize" utilization over the daylight hours on necessary flights have not been adequately considered, such as peak pricing, incenting small non-connecting flights away from Logan through the fee structure, and incenting fuller, fewer, and larger-capacity planes in smaller connecting flights.

My heart is in the first point above. As to Social Impacts, the Draft Environmental Impact Statement/Report states on page 6-5, "Implementation of any of the improvement alternatives would occur on the airport, and therefore there will be no division or disruption of established communities or orderly planned development as a result." I do not find this statement to be true.

The community of Somerville is a remarkable place. Initially reluctant to move here because of the livability rumors prevalent fifteen years ago, I instead became captivated by a little block-long neighborhood of well-cared-for homes of quiet, respectful families, and took proud possession of a house with stained glass, oak wainscoting, coved ceilings, a fireplace, a built-in library, a front porch, and a tiny garden--the house of my dreams. I've never regretted my fiance's and my ending our search elsewhere and moving here in 1985. Somerville presents a delightful combination of elements such as convenience to transportation, diversity in its citizens, historic architecture and craftsmanship in its homes, a lively artists' presence, a considered self-reflection, heightened in its present transition to a new mayor, on such issues as schools and youth activities and concern for seniors, and a growing awareness of the importance of green space (former Mayor Capuano headed an initiative to plant hundreds of trees on the city's streets) and community gardening. Of course all this is in addition to the superb restaurants the city has long been known for! I have also been active in the community chorus and in the process learned that there are over 350 musicians living here. For all of us Somerville citizens (in the most densely populated city in Massachusetts), whether working class, middle class, or those even more well-off who have settled here and meticulously restored those grand Victorian mansions, this is

home. We appreciate each other's presence and expect to be able to continue to live together here, peacefully.

On Easter morning this year, not only did we lose an hour's sleep in the change to Daylight Savings Time, but the airplanes from Runway 33L began launching themselves over our heads starting around 6:00 a.m. The din was constant into the afternoon, with takeoffs usually two minutes apart. Unfortunately that was the morning I had planned to sleep late, being in the midst of a major project at work which entailed working late every night for several weeks. I felt tremendously powerless against the noise that morning and, knowing that there were plans afoot to send three times as many planes over Somerville as a result of new runway 14/32, I felt crushed that my wonderful home and community could be torn apart, as those with the means to leave to escape the noise would over time sell and move away, leaving Somerville again a working-class-only town. I knew I could not myself tolerate the noise, and stay.

The effect of that noise is shattering. There is the sleep-loss factor, which is thoroughly debilitating in itself. As that demanding work project has progressed, I have dreaded coming home, wanting so badly to sleep, but not knowing if it would be Somerville's turn to stay up on into the night. But there is also the true trauma of the unremitting audible assault--the physical effect of the noise and vibration of the overflights, combined with not knowing how much more of that torture one would have to endure, and when it would start again once it stopped. I used to find it a bit exciting on a sunny Saturday while doing the laundry to hear the jets cutting through Somerville's skies on their way to adventure or family reunions or faraway places. I certainly appreciate the fact that part of the proximity that I enjoy in this close-in city is the opportunity without too much inconvenience to get to the airport for an occasional business trip or vacation. But the new plan for 14/32 would transform my community in ways that have not been considered in the Draft Environmental Impact Statement/Report. Indeed, as the report notes on page 6-10, "the flight tracks for Runway 14/32 will not involve overflying any neighborhoods that are not now overflown." But a threefold increase in air traffic over Somerville would have an enormous impact on this community. It is not enough not to overfly new communities; it is imperative as well not to degrade the quality of life in those presently overflown.

377.1

I have come to understand that Runway 33L is used when demand is low since it is part of the two-runway configuration available at Logan. And demand is likely low in the early morning and late at night. I also see in the Draft Environmental Impact Statement/Report that there is a limit to the number of hours in a day that a community is expected to bear the noise of overflights. But if the community's burden is during sleeping hours(after 10:00 p.m. and before 7:00 a.m.--and that should be on weekdays; on weekends a more realistic target is 8:00 a.m.), its tally should be weighted to count <u>in multiples</u> the sleeping hours. To keep people up late at night and then wake them again in early morning to use their share of the hours is unhealthy as well as inequitable.

It was odd to see Somerville not discussed in the Draft Environmental Impact Statement/Report. It appeared as a ghostly presence in Figures 5.2-5 on page 5-30 and 6.2-3 on page 6-13, under the flight path of Runway 33L. The means of measuring the impact of the noise of takeoffs over a 24-hour day causes the repeated 110dB single-takeoff impacts in Somerville (which my neighbors have measured over their homes) to

be reduced, through the magic of math, to below 65dB, and thus below the threshold of concern of the mathematical model which draws the 65dB contours shown in the report in Section 6.2. Repeatedly the report notes, as on page 7-18, that only in the denoted 65dB areas is an increase in sound level taken into consideration. But going forward with this plan would entail increasing sound in Somerville by a delta that would transform the community, and the report has not considered this outcome.

The report openly states, as on page 7-1, that the proposed plan would provide a significant reduction in noise for the most severely impacted areas. And those areas certainly deserve to be helped by some plan, one that considers all communities in the region, and the way that they all benefit from the availability of air travel, and the contribution and sacrifice they should each reasonably make. But I believe a better plan than this can be developed, one that analyzes more closely the precise nature of the delays (e.g., putting into perspective that only 20-25% of present delays are due to runway traffic), and the actual effect of enactment on those delays. The new plan should also take into account all the benefits to a regional air traffic plan that will result over the next few years from changes such as suburbanites' migration to accessible regional airports, limitation of small non-connecting flights into Logan, and limitation of low-volume flights. Ground transportation changes too should be included in the plan, both improved access by highway and rail for regional airports such as Worcester, and improved mass transit around Logan. 377.2 377.3

In short, greater vision is needed. In the few years since investigation for the report was begun, much has changed--and those changes need to be factored into the plan.

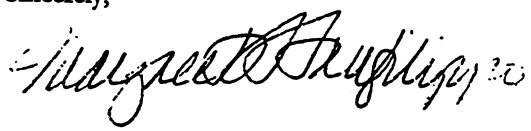
I recall an experience in business school of which the present dilemma reminds me. My study group had submitted our answer to a problem but were dismayed to learn that there was a second part to the problem which we had not discovered. Our professor permitted us to continue to work on our answer and submit our completed problem to offset our failing grade for the first effort. Similarly, this first effort is incomplete. I urge those making the decision on the Draft Environmental Impact Statement/Report to entrust consideration of the many-faceted air traffic problem in the Boston area to those with great vision, so that a better plan for all concerned emerges, one that does provide relief to those most severely impacted, but does not leave an undue burden of noise in the yards and in the windows of communities not even named in the report. We all benefit from convenient air travel in this area, and delays have affected most of us. But before another community is effectively redlined as a result of a runway plan that falls far short of solving the target problem, more effort is needed to evolve a plan that considers the effect on all communities, without artificial mathematical filtering that hides the effect on some communities.

Mr. Thomas Timkin of Massport presented the plan to a meeting on April 13 in Somerville. He told us he lives in Winchester. My manager at work lives in Winchester, and he has happily driven to Green Airport in Rhode Island to take advantage of the reduced prices for flights on Southwest Airlines. This is the type of effect I think deserves heavier consideration in preparation for the Final Environmental Impact Report. People are price-sensitive, as undoubtedly are small airlines who land at Logan as a matter of course, independent of their need to do so. There are many factors to

consider. I look forward with great anticipation to the FEIR, trusting that the neighborhood outcry that has greeted the DEIR has called attention to its incompleteness. Like my professor, I want to see a more successful and complete answer to a, here, too-vaguely-stated problem. I want a solution greater Boston can be proud of, and I believe that will be the outcome.

Thank you for this opportunity to share my thoughts.

Sincerely,



Margaret H. Sanfilippo

377.1	Noise	Impacts	The effect of that noise is shattering. ....a threefold increase in air traffic over Somerville would have an enormous impact on this community....	The Day-Night Sound Level values in Somerville are less than 60 dB for the future scenarios. The Supplemental DEIS/FEIR projects that the Preferred Alternative would promote runway use in a manner that is more consistent with annual PRAS goals, and Somerville is affected most by Runway 33 departures and Runway 15 arrivals. Total departures from Runway 33L and arrivals to Runway 15R would increase, but many of these are non-jets. These runway operating directions are currently running well below their PRAS goals, and the unidirectional Runway 14/32 would allow the controllers to approach but still remain below the annual goals for these operations. The PRAS goals were established based on a thorough public participation process in response to community noise concerns. Additionally, by increasing the number of operations over water, Runway 14/32 would reduce the total annual hours of dwell and persistence over populated areas in accordance with short-term PRAS goals.
377.2	Purpose and Need	Delays	....I believe a better plan than this can be developed, one that analyzes more closely the precise nature of the delays...	Delays occur when wind or weather conditions require the use of configurations with fewer than three active runways, when poor weather requires increased separation distances between aircraft, or when airlines schedule more flights than Logan Airport can handle. The Airside Project addresses delays from constraints at Logan Airport. Section 1.4 and Appendix C of the Supplemental DEIS/FEIR also contains a detailed discussion of the FAA and U.S. DOT delay measures and historical data, along with comparisons of Logan Airport delays within the context of delays at other United States airports.
377.3	Regional Transportation	Regional Airports	The new plan should also take into account all the benefits to a regional air traffic plan that will result over the next few years from changes such as suburbanites' migration to accessible regional airports, limitation of small non-connecting flights into Logan, and limitation of low-volume flights....	The Airside analysis does take into consideration the increasing attractiveness of the regional airports. Refer to Chapter 2 of the Supplemental DEIS/FEIR for a comprehensive discussion of the role of regional airports and other options to Logan Airport. Federal constitutional provisions (preemption, commerce clause, equal protection), federal aviation statutes and regulations, and contractual provisions related to covenants in connection with the federal Airport Improvement Program grants which Massport receives restrict Massport's ability to control the number of aircraft operations at Logan Airport. As such, Massport can not prohibit low-volume flights from using Logan Airport airport or unjustly discriminate against small aircraft.

LETTER 378

April 22, 1999

Mr. Arthur Puglsey
Unit Director
Massachusetts Environmental Affairs
Executive Office Building
100 Cambridge Street
Boston MA 02202

Dear Mr. Pugsley:

By means of this letter I am urging you NOT to approve the Massport environmental report on the proposed runway 14/32 at Logan Airport.

This report is not complete. Other alternatives such as the use of other ports in the area for smaller aircraft and freight planes has not been explored in this report. This research must be included, especially since even officials at Logan admit that the proposed runway is only a temporary solution. 378.1

Also this report does not take into account the quality of life for those affected by aircraft noise now and in the future. Someone living near Hanscom Field was quoted in the Boston Globe as saying in effect that people who in cities are used to noise unlike people in the suburbs. I like to hear the "noise" of my city -- the most densely populated city in New England. I like to hear the voices of children at play, greetings from one neighbor to another, the footsteps of the hundreds of people who pass by my house each week, the songs of birds. I cannot hear these city noises while airplanes roar overhead. 378.2

I cannot get to sleep at night when planes roar overhead after 11 PM. I cannot sleep through the night when planes road overhead at 1 AM, 2 AM, or 3 AM. I cannot enjoy the peace of the early morning hours when planes roar overhead starting at 6 AM or before. Outdoor activities, which should be enjoyable or relaxing, often are not because of planes roaring overhead.

I do not live in the part of Somerville most affected by aircraft noise -- yet my quality of life is seriously affected. And, we in Somerville are not as much affected as people in other communities such as East Boston, Winthrop, Roxbury, or Milton, for instance.

The environment for all of us in Massachusetts should be taken into consideration and protected. I trust you will do this.

Sincerely,

Jane Sauer

378.1	Regional Transportation	Regional Airports	....Other alternatives such as the use of other airports in the area for smaller aircraft and freight planes has not been explored in this report....	Regarding caps on airport operations, federal constitutional provisions (preemption, commerce clauses, equal protection), federal aviation statutes and regulations, and contractual provisions related to covenants in connection with the Federal Airport Improvement Program grants which Massport receives, restrict Massport's ability to control the number of aircraft operations at Logan Airport. However, all cargo operations were included in the future fleets analyzed in the Airside Project. Additionally, some cargo is now being diverted to regional airports as indicated by the strong growth in cargo services and air cargo activity at the regional airports.
378.2	Noise	General Opposition	...this report does not take into account the quality of life for those affected by aircraft noise now and in the future....	While equivalent jet operations increase by more than 50 percent from a 1993 base to the future 37.5M High Fleet scenario if the Preferred Alternative is implemented, the appropriate basis for comparison of the Preferred Alternative is the No Action Alternative. Equivalent jet operations would increase by more than 75 percent over the Preferred Alternative if no action were taken. Despite the increase in equivalent jet operations, the Airside analysis indicates that overall noise impacts decline over time with the elimination of Stage 2 aircraft and the replacement of hushkitted Stage 3 aircraft with non-hushkitted Stage 3 aircraft. By allowing aircraft operations to shift from over-land to over-water routings and by providing greater flexibility in the use of Runways 27 and 33L for takeoff, the Preferred Alternative further reduces the highest noise impacts to the close-in neighboring communities. Furthermore, the Supplemental DEIS/FEIR also demonstrates the more equitable balance of noise impacts among communities surrounding Logan Airport that can be achieved with the Preferred Alternative as opposed to the imbalance that occurs today and would occur in the future if no action is taken.

LETTER 379

Amanda Sawires
55 Columbus Avenue, #2
Somerville, MA 02143
617-628-6293

April 20, 1999

Arthur Pugsley
MEPA Unit
Executive Office of Environmental Affairs
100 Cambridge Street, 20th Floor
Boston, MA 02202

Dear Mr. Pugsley:

I am writing to express my opposition to MassPort's proposed Runway 14/32.

I have lived in the same address in Somerville for over seven years, and I absolutely attest to the fact that **air traffic over Somerville has increased in the past year**. My neighbors and I have been remarking to each other and lamenting to ourselves the noise from overhead flights that interferes with our sleep at night and wakes us each morning. I have been considering purchasing a house in Somerville but now hesitate to do so because, if Runway 14/32 is approved, I understand that air traffic over Somerville could triple. Somerville is a city with extremely high population density. I feel that increasing the number of flights over this large population is ill-advised and unfair. Current disturbances exceed an acceptable level. They interfere with a decent quality of ~~our~~ life in our neighborhoods. 379.1

Please do not approve Runway 14/32. I suggest that looking into a regional plan to manage air traffic, assessing the noise and burden on Somerville of air traffic, limiting the number of flights directed over Somerville and high population areas, and diverting flights to other airports in the region be considered as options. I would appreciate hearing what your position on this matter is. 379.2

Thank you in advance for your anticipated support.

Yours truly,

Amanda Sawires

The PRAS goals were established based on a thorough public participation process in response to community noise concerns. Additionally, by increasing the number of operations over water, Runway 14/32 would reduce the total annual hours of dwell and persistence over populated areas in accordance with short-term PRAS goals. Chapter 2 of the Supplemental DEIS/FEIR provides a discussion of the specific role played by the regional transportation alternatives and steps that Massport has taken to foster use of these alternatives. Massport has long recognized and has been a proponent of options to Logan Airport. Together with the regional airports, Massport has implemented a regional strategy to enhance the use of options to Logan Airport. In the Airside Project Draft EIS/EIR, Massport identified up to 7.3 million annual passengers that could be absorbed by regional alternatives that include use of T.F. Green/Providence, Manchester and Worcester Regional airports, as well as the new high-speed rail to New York. In the Supplemental DEIS/FEIR, Massport recognizes that these developments will slow Logan Airport's passenger traffic growth. Logan Airport may not achieve the 37.5 million passenger forecasts until after 2010, but rather closer to 2015, and the 45 million passenger forecasts may not be achieved until after 2020. While regional alternatives can play an important role in reducing the rate of future traffic growth at Logan Airport, they do not address Logan Airport's inability to efficiently accommodate current levels of demand during northwest wind conditions. Runway 14/32, which is designed to correct the problem with Logan Airport's layout, is necessary to correct this deficiency and provides clear benefits at current aircraft traffic levels. These benefits will only increase in the future, even as developments at the regional airports act to reduce the rate of future growth at Logan Airport.

LETTER 380

Dear Mr. Pugsley:

I am a resident of Somerville, a voter, a taxpayer, and a very concerned citizen. I oppose Massport's plans to build Runway 14/32.

Frankly, if part of environmental impact is its effect on human beings, I'm not sure we can even take Massport's proposal seriously. Somerville is one of the most densely populated cities in the state. I'm sure the surrounding communities reflect this as well - in Medford, Cambridge, etc. While Massport has hit the road telling different communities that the traffic over them will decrease, if Massport gets its way, air traffic over us will increase - by 300%. Three times the burden of noise, disruption, and pollution we now share with our urban neighbors. 380.1

How is it desirable to solve a problem already clearly intolerable (and managed) for communities like East Boston with mere shifts and squeezing the deleterious effects onto a smaller slice of the urban ring? How is it fair? How does it help?

Massport is thinking too small. The wailing and gnashing of teeth about Boston's status as a "world class city" is only showing that the wailers haven't been to very many of them. Take New York. There's a world-class city. Three airports. Each one a good forty minutes to God-knows-when away from the center of town. One is even in another state. It doesn't seem to be stopping the legions of businesspeople, tourists, and conventioneers from going to New York. London is served by two airports, to its west and south, each a train ride away from the city proper. Gatwick's train takes you through rolling hills and farmland on your way to town. It doesn't seem to keep London from offering businesspeople, tourists, and conventioneers a world-class city. But Gatwick and Heathrow in London, and Kennedy, La Guardia, and Newark in New York do relieve the impact of these busy, busy airports on an already overburdened metropolitan center.

Of course, the Boston area needs to accommodate air travel. I wouldn't want it any other way. I live here; I want it to be as thriving, successful, accessible as any other great town. I travel. I want the airport(s) to serve me well. But there are ways to share the impact of growing air traffic other than switching around the communities to harm, and hoping they won't have the power, money, or influence to have a say about it. 380.2

Regional development without a new runway could benefit everyone.

But I hear that the business community will never let it happen, and the wealthy communities surrounding Hanscom will never let it happen, and that the Governor has boxed himself into a corner and will never let it happen, and that despite what is clearly in the best interest of everyone in the area, Massport will never let regional development happen. Not when they own this runway.

Runway 14/32 will do more harm than good. Its impact will hurt the environment for many, many people who work here, raise families here, and call it home. You tell me, Mr. Pugsley: can the Office of Environmental Affairs let this go forward? Does environmental impact include its effect on people?

Very sincerely yours,

Marguerite Scott

Logan Airport may not achieve the 37.5 million passenger forecasts until after 2010, but rather closer to 2015, and the 45 million passenger forecasts may not be achieved until after 2020. While regional alternatives can play an important role in reducing the rate of future traffic growth at Logan Airport, they do not address Logan Airport's inability to efficiently accommodate current levels of demand during northwest wind conditions. Runway 14/32, which is designed to correct the problem with Logan Airport's layout, is necessary to correct this deficiency and provides clear benefits at current aircraft traffic levels. These benefits will only increase in the future, even as developments at the regional airports act to reduce the rate of future growth at Logan Airport.

LETTER 381

Dear Mr. Pugsley,

I am against the proposed new runway at Logan Airport for several reasons. First, I live in Somerville where air traffic is expected to increase by close to 300% if the new runway is built. How it can be considered fair, or even intelligent, to increase airplane noise to this extent over one of the most densely populated areas of the state is beyond me.

Second, I have lived in Somerville for ten years. Over the first nine and three-quaters years, airplane noise was negligible. Over the last three months, it has been, at times, unbearable. And yet Massport insists that air traffic over Somerville has not increased in the last year. This assertion is so ridiculous as to be either an outright lie or a statement of misinformation so twisted as be no better than a lie, and proves Massport to be an trustworthy organization. 381.1

Third, I spend a great deal of time in Boston's North End. Tourists go there to relax and visit historic sites. And yet, as they are walking the streets, airplanes are constantly flying overhead, completely destroying the ambiance they came to Boston for.

Fourth, the argument that Boston must have a new runway to compete with other cities around the world is ridiculous. New York City has two airports, neither of which is downtown. The same can be said for London. Washington DC's airport is not downtown. Nor is New Orleans' or Tokyo's. The list of major cities in which the airport lies an hour or so away goes on and on. 381.2

In summary, building a new runway would have an extremely negative impact on the quality of life for thousands of people in countless neighborhoods close to Boston, as well as an adverse effect on tourists visiting Boston for its historic sites. I am opposed to it.

Sincerely,

Jerry Shine
204 Powderhouse Blvd.

Code	Topic 1	Topic 2	Comment	Response
381.1	Noise	General Opposition	....How it can be considered fair...to increase airplane noise [300%] over one of the most densely populated areas of the state is beyond me.	The Day-Night Sound Level values in Somerville are less than 60 dB for the future scenarios. The Supplemental DEIS/FEIR projects that the Preferred Alternative would promote runway use in a manner that is more consistent with annual PRAS goals, and Somerville is affected most by Runway 33 departures and Runway 15 arrivals. Total departures from Runway 33L and arrivals to Runway 15R would increase, but many of these are non-jets. These runway operating directions are currently running well below their PRAS goals, and the unidirectional Runway 14/32 would allow the controllers to approach but still remain below the annual goals for these operations. The PRAS goals were established based on a thorough public participation process in response to community noise concerns. Additionally, by increasing the number of operations over water, Runway 14/32 would reduce the total annual hours of dwell and persistence over populated areas in accordance with short-term PRAS goals.
381.2	Regional Transportation	Regional Airports	... the argument that Boston must have a new runway to compete with other cities around the world is ridiculous. New York City has two airports, neither of which is downtown. The same can be said for London. Washington, D.C.'s airport is not downtown. Nor is New Orleans' or Tokyo's. The list of major cities in which the airport lies an hour or say away goes on and on.	The goals of the Airside Project are to reduce delay, increase the airport's efficiency, and improve airfield safety in an environmentally responsible manner. The construction of unidirectional Runway 14/32 would prevent the significant drop in airfield capacity that now occurs during northwest wind conditions. The runway would not increase Logan Airport's normal operating capacity of approximately 120 operations per hour which is available nearly 80 percent of the year, but rather would allow this capacity to be maintained more consistently.

LETTER 382

Dear Mr. Pugsley:

I am writing this message as a resident of Somerville in strong protest to the proposed building of Runway 14/32 at Logan Airport. The building of this runway will result in a 300% increase in air traffic volume over Somerville. The data used for justifying the building of this runway is out of date - from 1993! A close look at more recent data from Logan shows that air traffic delays have actually decreased over the last decade. 382.1

Also, no official decibel level study of the noise impact on Somerville has been conducted; something that has been done for other communities potentially affected by runway construction. Why is this the case? Is it because Somerville has population largely comprised of ethnic and racial minorities, blue collar workers and others with low income levels? Don't our votes, taxes and quality of life issues matter? 382.2

me guess - you don't live in Somerville. Second guess, maybe a nice quite community like Arlington, Lexington, or some other suburb.

Sincerely,
Deirdre Smith
One Fitchburg St. #B-250

382.1	Purpose and Need	Delay	....The data used for justifying the building of this runway is out of date--from 1993! ...more recent data from Logan shows that air traffic delays have actually decreased over the last decade.	Logan Airport flight delays, as measured by the FAA, did decline between 1993 and 1997. Nevertheless, the same data show that Logan Airport was consistently ranked as one of the nation's most delayed airports throughout this period. In 1998, delayed flights at Logan Airport, as reported by the FAA increased by more than 30 percent, and continued to increase in 2000. In 2000, Logan was the second most delayed airport for arrivals in the U.S. This represents the worst delay ranking in Logan's history. There are three reasons for the decline in delays between 1993 and 1997. First, in 1997, the number of hourly scheduled flights was less than Logan Airport's normal operating capacity of 120 flights per hour, unlike 1993, when airlines scheduled flights well beyond Logan Airport's hourly capacity. Second, Logan Airport's hourly demand profile is flatter than it was in 1993. Airlines are spreading scheduled flights throughout the day taking advantage of Logan Airport's off-peak hours (*e.g.*, 10 AM to 1 PM). Finally, airlines are carrying more passengers per flight. In fact, with roughly the same number of flights as in 1993, Logan Airport accommodated over 3 million more passengers. One reason for this is that the regional carrier network serving New England is more efficient. In 1993, there were three regional carrier systems serving 2.1 million regional passengers at Logan Airport. Since 1994, Logan Airport has been served by two regional airline systems (Business Express, now American Eagle, and US Airways Express). These carriers handled 2.2 million Logan Airport passengers in 1998. Key lessons learned from this are: 1) while PPP might work in conditions of overscheduling, such as the 1993 environment, because there is no sustained period of flight overscheduling at Logan Airport today, PPP would not provide meaningful delay reduction in the current operating environment; and 2) while delays declined from 1993 to 1997, Logan Airport continued to be one of the most delayed airports in the country because, even though carriers were more efficient at scheduling flights, delays caused by wind and weather continued to occur. The projections of future airfield delays at Logan Airport are not based on analysis and modeling of delays which occurred during 1993. The analysis for 1993 was included in the Airside Project Draft EIS/EIR to provide historical perspective to the delay problem at Logan Airport and for use in model calibration. The analysis contained in the Supplemental DEIS/FEIR has been updated to include modeled delay results for 1998 to provide more current context to airfield conditions at Logan Airport. Refer to Section 4.2 of the Supplemental DEIS/FEIR for a description of the delay analysis and discussion of current and future delays at Logan Airport.

Code	Topic 1	Topic 2	Comment	Response
382.2	Noise	General Opposition	...no official decibel level study of the noise impact on Somerville has been conducted; ....Is it because Somerville has population largely comprised of ethnic and racial minorities, blue collar workers and others with low income levels? ...	The Day-Night Sound Level values in Somerville are less than 60 dB for the future scenarios. There should be no new effects on the value of property or unacceptable increase in noise exposure for any of the alternatives. Future scenarios analyzed in this study have to rely on computations rather than measurements, since they occur in the future. However, if you are interested in measuring current conditions in Somerville, you should contact Massport and discuss your ideas. Refer to Section 6.8 of the Supplemental DEIS/FEIR for a discussion of the Environmental Justice analysis. Noise was found to be the only adverse impact from the Preferred Alternative with the potential for Environmental Justice impacts. Additional demographic analysis of the noise-affected areas was conducted to determine if minority and/or low-income populations would be disproportionately affected by the Preferred Alternative. This analysis found that there is no high and adverse disproportionate impact caused by the Preferred Alternative.

Secretary, MEPA Unit, Executive Office of Environmental Affairs
100 Cambridge Street, 20th Floor
Boston, Massachusetts 02202

Attention: Arthur Pugsley, File No. 10458 EOA

Dear Secretary Durand:

I am writing in order to state my strenuous opposition to proposed new Runway 14/32, as outlined in the *Environmental Impact Statement (EIS)* that has been submitted to you for approval by the Massachusetts Port Authority (Massport) and the Federal Aviation Administration (FAA). I am in basic agreement with the findings presented in the *Review Comments on Draft Environmental Impact Statement/Draft Environmental Report (DEIS/DEIR) for the Logan Airside Improvements Planning Project*, prepared by the consultant team to the Community Advisory Committee (CAC) to Massport, and I am sure that many individuals who have submitted written comments to you have reiterated that document's findings with regard to the deficiencies of the EIR. Rather than reiterate those findings, my goal in this letter is to present concerns about Runway 14/32 that are specific to the City of Somerville, where I have lived continuously in the home that I own since October of 1991, and where I lived previously for two and one-half years, from 1984 to 1986. My concerns are as follows

I. Somerville has not been given due consideration, in the EIR, with regard to the actual impacts that it will sustain as a result of Runway 14/32.

Massport states that, with 14/32 in place, air traffic over Somerville will increase by approximately 300%. However, this figure would appear to be a substantial underestimate as it is based solely on historical-use data for Runway 15/33 despite the fact that other runways also generate air traffic over Somerville. Massport officials, including Chief Executive Officer Peter Blute and Director of Aviation Planning and Development Betty Desrosiers, have contended that Somerville receives air traffic from Runway 15/33 only (respective sources: a *Somerville Journal* article by Dorothy Pomerantz, published on Jan. 21, 1999, and remarks to state representatives at a meeting at the State House this past winter, as related by Fred Cabral, aide to State Representative Timothy Toomey). This assertion that Somerville receives air traffic from Runway 15/33 only is both inaccurate and disingenuous as it takes into account jets only while excluding turboprops, which represent a substantial segment of the air-traffic fleet. 383.1

According to printed copies of my calls to Massport's Noise Abatement Complaint Line (Appendix), as well as verbal, recorded (by Massport) responses of Massport staffpersons to my questions, configurations 27/22, 22L/22R, 4L/4R, and 4/9 all are frequent sources of air traffic over Somerville. For example, three times during the process of composing this letter over a 72-hour period, when I called the Noise Abatement Complaint Line to ask the source of air traffic over my neighborhood, 27/22 was cited as being the runway in use on both the first and the third occasions, and 4L/4R was cited on the second

occasion. In a phone conversation with me yesterday, Massport Spokesperson Jeremy Crockford, while admitting that turboprops may "disperse" over Somerville after takeoff from *any* runway, tried to dismiss these impacts, stating that "*Most* people are concerned with *jet* traffic." This totally ignores the fact that, for the last year, Somerville residents have been awakened by turboprops and cargo planes, *not* jets, in the middle of the night, for days and weeks on end. It also overlooks the fact that these smaller aircraft typically generate *more* noise than their larger counterparts, since they tend to fly at lower altitudes.

Moreover, visual observation of planes flying over Somerville when runways other than 15/33 are in use indicates that a number of these aircraft are not turboprops but, rather, jets that apparently have deviated from their initial flight tracks.

It also strains credibility to assume that the so-called "over-the-water" approaches that are constantly mentioned by Massport in reference to Runway 14/32 would never culminate in deviations to a westerly path after initial takeoff, similar to the deviations that occur relative to the already existing runways.

Thus, Somerville's *aggregate* air-traffic increase due to 14/32 would be approximately 300% for jet departures from 15/33 *combined* with whatever indeterminate (because not yet estimated) but substantial increases would accrue from the other runways that generate both turboprop and "off-course" jet traffic over our city. (Air traffic associated with Runway 27/22, for example, is projected by Massport to increase fourfold.)

II. Massport has failed to take into account the disproportionate amount of air traffic associated with Runway 15/33 that Logan Airport's FAA-run control tower routes over Somerville during so-called off-peak hours (nighttimes, early mornings, weekends, and holidays – the times when people are most likely to be at home trying to sleep, study, converse with family and friends, and generally relax) – and it has not addressed the corresponding air-traffic increases that would occur during those hours if Runway 14/32 is built.

383.2

Massport has stated that Runway 15/33 is the *preferred* configuration during off-peak hours. According to the report of the consultants to the CAC, nighttime jet operations at Logan "can be expected to *double* within the foreseeable future" (p. 18, D.1.b Night-time Operations). Residents of a number of Somerville neighborhoods, including my own, near Inman Square, Cambridge, that of Winter Hill, and that in the Porter Square area, already have an extremely limited (approximately six-hour) time-span during which sleep without being disturbed by aircraft is possible; this is especially true during the spring and fall, when Runway 15/33 is relied on heavily. This obviously too-brief window for sleep often is diminished even further by middle-of-the-night air traffic sufficiently loud to awaken one from a sound sleep, which has become increasingly common over the last year. I and other Somerville residents have experienced sleep deprivation on many occasions because of such disturbances. Sleep deprivation is rapidly coming to be recognized as a significant public-health problem and as a precipitating factor in many motor-vehicle accidents. My job requires me to commute to and from Needham from my home, five days a week, on two major expressways (the Massachusetts Turnpike and Route 128). Anyone who has ever traveled on these roads during rush hour can attest to the high and constant level of alertness that is needed to avoid being involved in a collision. Another adverse effect of sleep deprivation is diminished job

performance. Nowhere in its EIR do Massport and the FAA address the repercussions of sleep deprivation due to air traffic. Apparently this concern is too trivial to warrant consideration compared with the all-important issue of business travelers' feelings of frustration over flight delays at Logan. It can only be hoped that MEPA uses a more balanced and humane system of prioritization. 383.3

III. Massport has done no study of air-traffic noise impacts on Somerville. 383.4

While Massport has placed noise monitors in other communities, not only has it not done so in Somerville, it *refused* to do so, despite a request made in June 1998 by the Somerville Board of Aldermen.

In conclusion, I ask that MEPA find the EIR submitted by Massport and the FAA to be inadequate and that both Massport and the FAA be directed to do the following. (1) They should provide a true and accurate estimate of the *total* air-traffic increase that Somerville would incur as a result of Runway 14/32. This calculation should take into account *all* runway configurations that affect the city – not just 15/33 but also 27/22, 22L/22R, 4L/4R, and 4/9 – and *all* types of aircraft – not just jets but turboprops and cargo planes as well. Massport's official position that only Runway 15/33 affects us in any meaningful way is in stark contradiction to the experience of Somerville residents and is clearly self-serving in that it allows Massport to predict air-traffic increases much lower than those that will actually result if Runway 14/32 is implemented. (2) Massport and the FAA should provide a *separate* estimate of the increase in so-called off-peak air traffic that would accrue over Somerville in association with Runway 14/32 – again, with regard to *all* runways and *all* types of aircraft. Because sleep deprivation is an adverse *health* impact, it should be classified as such and weighted accordingly by MEPA. Further, Massport and the FAA should be enjoined to cease the routine disturbance of residents' nighttime sleep, either through implementation of a curfew between the hours of 10 p.m. and 7 a.m. (as is imposed by National Airport serving the Washington, D.C., area) or by an expansion of Massport's current Noise Rules, or both. (3) Massport should be required to place noise monitors in Somerville, especially (but not only) in the most elevated and densely populated areas.

As was pointed out by a participant in the Runway 14/32 meeting that Congressman Michael Capuano hosted on March 27 at Bunker Hill Community College, Boston is unique in that it has a major international airport (Logan) located in such immediate proximity to so many residential neighborhoods. Other cities that Massport has mentioned as having added new runways are not appropriate analogies to our current situation (as Massport wishes people to believe that they are) because those cities do not have 1.4 million people living directly under the flight paths as we do.

I deeply hope that your decision will be based on the welfare of those of us who make our homes, earn our livings, and pay our taxes here in the Commonwealth, rather than on dubious profit-motivated arguments and misplaced concerns about the transient aggravation that some travelers (including those of us who oppose 14/32) may experience some of the time. (It is pertinent to not here that delays at Logan have *decreased* over the past six years.) Convention-goers and other passengers from both in and out of state will not suffer egregious harm because of a 20-minute wait at a departure gate. In contrast, residents' quality of life and, perhaps just as importantly, their faith in agencies such as MEPA that are entrusted with protecting the public from injury

by powerful parties that wield disproportionate monetary and political influence, stand to be shattered irreparably if the ill-advised, environmentally disastrous runway proposal of Massport and the FAA is allowed to triumph.

Thank you for reading and considering my comments.

Sincerely,

Allison Stieber

Code	Topic 1	Topic 2	Comment	Response
383.1	Alternatives	Runway 14/32	Massport states that, with 14/32 in place, air traffic over Somerville will increase by approximately 300%. However, this figure would appear to be a substantial underestimate as it is based solely on historical-use data for Runway 15/33 despite the fact that other runways also generate air traffic over Somerville....	The Supplemental DEIS/FEIR provides updated information for 1998—the latest year for which actual Logan Airport data are available. 1993 was adopted as the base year when the Airside Improvement studies commenced in 1994. The primary function of the Base Year analysis is to calibrate the airfield operation models and environmental impact models. The benefits and impacts of the action alternatives (Alternatives 1, 1A, 2 and 3) are assessed by comparing these not with the base year, but with Alternative 4, the No-Action Alternative. The planning scenarios for 37.5 and 45 million passengers represent a range of future activity at Logan Airport expected in the 2010 to 2020 time frame. The Supplemental DEIS/FEIR contains a discussion of the FAA and DOT delay measures and historical data, along with comparisons of Logan Airport with other United States airports. The FAA consistently rates Logan Airport as one of the most delay prone airports in the United States Logan Airport's estimated annual delay hours are over five times the FAA's threshold of 20,000 hours for a severely delayed airport. FAA Opsnet delays at Logan Airport peaked in 1993, declined for two years and are rising again. Arrival delays which would be directly affected by Runway 14/32 have risen steadily since 1994. The Day-Night Sound Level values in Somerville are less than 60 dB for the future scenarios. However, if you are interested in measuring current conditions in Somerville, you should contact Massport and discuss your ideas.
383.2	Noise	Model	Massport has failed to take into account the disproportionate amount of air traffic associated with Runway 15/33 that Logan Airport's FAA-run control tower routes over Somerville during so-called off-peak hours...and it has not addressed the corresponding air-traffic increases that would occur during those hours if Runway 14/32 is built.	If the Preferred Alternative is implemented, Somerville's overflights will increase in comparison to the No Action Alternative. However, the highest resulting noise exposure in that community is estimated to be on the order of 55 dB DNL, well beyond the 60 dB DNL contours shown in Figures 6.2-8 and 6.2-10 through 6.2-14 of the Supplemental DEIS/FEIR. Both the delay model and the noise model used in this evaluation do take into account the operations over Somerville, but the noise exposure levels resulting from those operations are relatively low compared to other communities and are not in any way considered incompatible with residential land uses in the community.

Code	Topic 1	Topic 2	Comment	Response
383.3	Noise	Impacts	....Nowhere in its EIR do Massport and the FAA address the repercussions of sleep deprivation due to air traffic....	The Night Equivalent Sound Level (LeqN) was calculated at 23 selected locations for all fleets and scenarios. Tables 6.2.15and 6.12-16 of the Supplemental DEIS/FEIR report these data for the 29M Low and 37.5M High Fleet scenarios of the Supplemental DEIS/FEIR. The results show that, at most locations, the LeqN for the future fleets is lower than for the 1993 case. Where there is an increase in LeqN, the reason was the increase in flights for the No Action Alternative, which generally was mitigated by the Preferred Alternative. These results indicate that there will be less sleep disturbance in the future than that currently experienced. Refer to Section 7.4 of the Supplemental DEIS/FEIR for a discussion of cumulative noise impacts.
383.4	Noise	Impacts	Massport has done no study of air-traffic noise impacts on Somerville.	The Day-Night Sound Level values in Somerville are less than 60 dB for the future scenarios. However, if you are interested in measuring current conditions in Somerville, you should contact Massport and discuss your ideas.

LETTER 384

Robert Durand, Secretary
MEPA Unit-EOEA
Att: Arthur Pugsley, File # 10458EOA
100 Cambridge St.,20th Floor
Boston, MA 02202

April 22,1999

I am writing to register our strong objection to runway 14/32. We are already uncomfortable with the noise polution from flights over our city. A night time curfew ought to be enforced! Recent flights over Somerville seem to be getting lower! We understand there has been no citywide noise impact study with microphones done in Somerville as there have been in other affected communities! More Logan flights will make the traffic to and from the airport even more overwhelming. 384.1 384.2 384.3

It is my understanding that the data used to justify the need for a new runway is based on Logan's worst year for flight delays (1993) and that delays at Logan have actually decreased over the last 6 years. 384.4

An increase of air traffic over Somerville by **300%** or more is not acceptable.

384.2	Noise	Impacts	...there has been no citywide noise impact study with microphones done in Somerville...	The Day-Night Sound Level values in Somerville are less than 60 dB for the future scenarios. However, if you are interested in measuring current conditions in Somerville, you should contact Massport and discuss your ideas.
384.3	Ground Transportation	Access to Logan	More Logan flights will make the traffic to and from the airport even more overwhelming.	The Preferred Alternative is not expected to lead to an increase in passenger demand, and therefore, it will have no effect on congestion or delays on Boston area highways. Refer to Section 4.2 of the Supplemental DEIS/FEIR.
384.4	Purpose and Need	Delays	...data used to justify the need for a new runway is based on Logan's worst year for flight delays (1993)...	The projections of future airfield delays at Logan Airport are not based on analysis and modeling of delays which occurred during 1993. The analysis for 1993 was included in the Airside Project Draft EIS/EIR to provide historical perspective to the delay problem at Logan Airport and for use in model calibration. The analysis contained in the Supplemental DEIS/FEIR has been updated to include modeled delay results for 1998 to provide more current context to airfield conditions at Logan Airport. Refer to Section 4.2 of the Supplemental DEIS/FEIR for a description of the delay analysis and discussion of current and future delays at Logan Airport.

LETTER 385

17 Boston Ave.
Somerville, MA 0211

Robert Durand, Secretary
MEPA Unit - Office of Environmental Affairs
Attn: Arthur Pugsley, File # 10458 EOA

Dear Sir:

The noise level and frequency of flights over our neighborhood is already at an entirely unacceptable level. The question should not be whether to increase the number of these flights in our or any other direction, but urgently to reduce the noise level and frequency of these flights. 385.1
At the present levels, economic damage is wreaked upon our community and this state through poor job performance and missed work days due to sleeplessness caused by this noise. The noise can be heard in the shower during a shower and 385.2
continues until 2 a.m., with jets leaving every minute on occasions lasting for over an hour. Further economic damage results from depreciated real estate values, stress 385.3
levels causing more violence and vehicle

accidents. Any consideration of authorizing any new runway at Logan Air port must be undertaken by the either extremely over-paid or extremely weak-minded. I pledge my whole-hearted spiritual, intellectual, and financial support to any efforts to resist this proposed runway.

Sincerely,

Daniel Toner

Letter 385

Code	Topic 1	Topic 2	Comment	Response
385.1	Noise	Impacts	The question should not be whether to increase the number of flights in our or any other direction, but urgently to reduce the noise level and frequency of these flights.	The Day-Night Sound Level values in Somerville are less than 60 dB for the future scenarios. The Supplemental DEIS/FEIR projects that the Preferred Alternative would promote runway use in a manner that is more consistent with annual PRAS goals, and Somerville is affected most by Runway 33 departures and Runway 15 arrivals. Total departures from Runway 33L and arrivals to Runway 15R would increase, but many of these are non-jets. These runway operating directions are currently running well below their PRAS goals, and the unidirectional Runway 14/32 would allow the controllers to approach but still remain below the annual goals for these operations. The PRAS goals were established based on a thorough public participation process in response to community noise concerns. Additionally, by increasing the number of operations over water, Runway 14/32 would reduce the total annual hours of dwell and persistence over populated areas in accordance with short-term PRAS goals.
385.2	Noise	Impacts	At the present levels, economic damage is wreaked upon our community and this state through poor job performance and missed workdays due to sleeplessness caused by this noise....	Table 6.2-17 of the Supplemental DEIS/FEIR shows nighttime jet operations projected to increase from 144 in 1998, to as many as 231 under the No Action Alternative with the 2015 High Regional Jet Fleet. However, regardless of the fleet, many of the future night operations are the result of delays that will occur as demand at Logan Airport continues to increase. One of the direct benefits of the Preferred Alternative is that it will reduce these night operations by 32 to 43 flights depending on the fleet forecast, though *any* alternative to the No-Action scenario will help alleviate some of the projected delays. In addition, Massport is committed to exploring other measures to reduce nighttime noise whether or not the Preferred Alternative is implemented.
385.3	Noise	Impacts	...Further economic damage results from depreciated real estate values, stress levels causing more violence and vehicle accidents....	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR respond to federal and state scoping directives and applicable FAA environmental orders and all other NEPA and MEPA requirements, and provide appropriate analytical content for assessing alternatives.

LETTER 386

ROBERT DURAND, SECRETARY
MEPA UNIT - EXECUTIVE OFFICE ENVIRONMENTAL AFFAIRS
100 CAMBRIDGE ST. 20TH FLOOR
BOSTON, MA. 02202
(617) 727-1598

APRIL 22, 1999

DEAR MR. DURAND,

I AM FAXING YOU TODAY BECAUSE I HAVE LEARNED OF MASSPORT'S PLANS TO BUILD A NEW RUNWAY WHICH IS LIKELY TO HAVE A SIGNIFICANT IMPACT ON MY PROPERTY VALUE AND MY QUALITY OF LIFE. I AM A SOMERVILLE RESIDENT.

AS A CITIZEN, I DEMAND:

1. A CITYWIDE IMPACT STUDY AS HAS BEEN DONE IN OTHER EFFECTED COMMUNITIES. 386.1
2) A MODERN ENVIRONMENTAL IMPACT STATEMENT DERIVED FROM 1999 DATA - NOT 1993, THE WORST YEAR FOR DELAYS AT LOGAN. (How dare you try to slide by on this!) 386.2
3) AUTO TRAFFIC STUDIES ON HOW TO CONTEND WITH INCREASED TRAFFIC CONGESTION CAUSED BY A THE 300%! INCREASE IN AIR TRAFFIC RUNWAY 14/32 WILL CAUSE. 386.3
4) AN ERNEST INVESTIGATION OF THE POSSIBILITIES OF HANSCOM FIELD OR WORCESTER AIRPORTS AS ALTERNATIVES (Perhaps using Worcester might also generate some desirable economic by products for this struggling city.) 386.4

THANK YOU
SINCERELY,
Carla Wilbur

Letter 386

Code	Topic 1	Topic 2	Comment	Response
386.1	Environmental Review Process	MEPA	I demand a citywide impact study as has been done in other [a]ffected communities.	The Day-Night Sound Level values in Somerville are less than 60 dB for the future scenarios. However, if you are interested in measuring current conditions in Somerville, you should contact Massport and discuss your ideas.
386.2	Analysis Assumptions/ Methodologies	Base Year	I demand a modern environmental impact statement derived from 1999 data—not 1993, the worst year for delays at Logan.	The projections of future airfield delays at Logan Airport are not based on analysis and modeling of delays which occurred during 1993. The analysis for 1993 was included in the Airside Project Draft EIS/EIR to provide historical perspective to the delay problem at Logan Airport and for use in model calibration. The analysis contained in the Supplemental DEIS/FEIR has been updated to include modeled delay results for 1998 to provide more current context to airfield conditions at Logan Airport. Refer to Section 4.2 of the Supplemental DEIS/FEIR for a description of the delay analysis and discussion of current and future delays at Logan Airport.
386.3	Ground Transportation	Access to Logan	I demand auto traffic studies on how to contend with increased traffic congestion caused by the 300% increase in air traffic runway 14/32 will cause.	The Preferred Alternative is not expected to lead to an increase in passenger demand, and therefore, it will have no effect on congestion or delays on Boston area highways. Refer to Section 4.2 of the Supplemental DEIS/FEIR.

Code	Topic 1	Topic 2	Comment	Response
386.4	Regional Transportation	Regional Airports	I demand an [earnest] investigation of the possibilities of Hanscom Field or Worcester airports as alternatives.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR, specifically considered the role of Hanscom Field in the analysis of regional alternatives. Hanscom Field, which serves as a general aviation reliever airport to Logan Airport, already accommodates a significant number of aircraft operations (183,000 operations in 1998). The Hanscom Field activity includes private, business, charter, and air taxi operations that might otherwise use Logan Airport. Since the Airside Project Draft EIS/EIR was filed, Shuttle America, a newly founded airline, began commercial scheduled operations at Hanscom Field, offering limited turboprop services to short-haul regional markets – Trenton, Buffalo, Hartford (discontinued), Wilmington, Delaware (discontinued), and Greensboro. Shuttle America is also conducting operations between Hanscom and New York LaGuardia Airport. While Massport supports commercial service at Hanscom Field consistent with its established limits (60 seat regulation), Massport believes that Hanscom Field will maintain its role as a major general aviation reliever, and that its geographic proximity to Logan, Worcester Regional and Manchester airports will prevent its development as a significant commercial airport. Additionally, commuter airlines serving Logan Airport are unlikely to move a significant number of flights from Logan Airport to Hanscom Field, since approximately 50 percent of passengers on Logan Airport's commuter flights connect to other Logan Airport flights and a significant number of passengers are travelling to Boston. However, any new commercial service initiatives proposed for Hanscom Field shall be reviewed for consistency with the *Hanscom GEIR* (HGEIR) and its Annual Updates, and shall be considered by the Hanscom Area Town Selectmen (HATS). Refer to Section 2.6 of the Supplemental DEIS/FEIR for a discussion of Hanscom Field. Since 1995, Massport has worked closely with the City of Worcester to aggressively market the Worcester Regional Airport to airlines. Massport increased its involvement with Worcester Regional Airport by assuming operational responsibility of the airport on January 15, 2000. Since January 2000 Massport has attracted three new airlines to Worcester Regional Airport. Delta Connection began serving Worcester Regional Airport with two daily nonstop roundtrip flights on regional jet aircraft to Atlanta on February 1, 2000 and will be increasing its service to three daily flights in April 2001. On July 6, 2000, American Eagle began service to New York JFK Airport with three daily nonstop roundtrip flights on turboprop aircraft. In February 2001, PanAm began daily scheduled service from Worcester to Orlando International Airport. Massport is in ongoing discussions with other carriers regarding potential new services at Worcester Regional Airport. In addition to the Worcester Regional Airport, Massport has pursued a variety of initiatives to promote the use of other regional airports and travel modes with the goal of relieving traffic growth pressures at Logan Airport. For example, in November 1999, Massport and Governor Cellucci co-sponsored a Regional Transportation Summit of the New England Governors and transportation officials. The Summit focused on joint marketing among the New England commercial service airports and the joint promotion of rail and road initiatives that will foster an efficient and balanced regional transportation system. A second summit was held in Rhode Island in December 2000. Refer to Chapter 2 of the Supplemental DEIS/FEIR for a comprehensive discussion of Massport's regional transportation planning initiatives. Massport disagrees that its record in diverting traffic to other airports is unsuccessful. Since 1996 eight out of ten new passengers in New England were directed to regional airports, which include T.F. Green/Providence, Worcester Regional, and Manchester airports. In 1999, Massport estimates that regional airports attracted 2.4 million passengers that would have otherwise used Logan Airport.

LETTER 387

Dear Sir:

I am writing to discourage any attempt on the part of Logan Airport and Massport to expand runways and thus airplane usage. I have been a resident of Somerville for 20 years, and have definately noticed a large incresae in jets flying over the city in the last two or three years. The idea of three times the traffic is absurd and a definate infringement on my quality of life. If Massport needs more airplanes coming into the area, let them move out to Hanscom Field and expand there or some other place not as densly populated as Somerville and the greater Boston Urban area. Many cities can support more than one major airport. Boston could as well. I definately oppose any runway or flight expansion.

387.1

Thank You:

COMMENT PROCEDURE for: Draft Logan Airside Improvements (a.k.a. Runway 14/32) **EOEA #10458**

All comments on EIRs (environmental impact report) must refer to the EOEA file number. There may be other identifying numbers. but the EOEA file number is the one which must be used.

Comments not referring to the EOEA file number may not be considered. LETTER 388

All comments must be received April 22. 1999
All mail concerning the environmental impact review process including filings. comments. and all associated materials must be addressed to:

Bob Durand. Secretary
Executive Office of Environmental Affairs
Attention: MEPA Office
Arthur Pugsley EOEA No. #10458
100 Cambridge Street - 20th Floor
Boston. MA 02202

Failure to address mail in this manner may result in delay of action on comments or no action on comments at all.

Dear Mr. Durand,

My comments to the EIR-Logan Airside Improvements Plan EOEA #10458 are as follows:

I live in West Roxbury under the flight path of planes using Runway 27. The noise the planes make when wind conditions make the use of Runway 27 necessary, is very disturbing. It is heard from the first thing in the morning until one goes to sleep at night. It diminishes the quality of life. It interrupts television viewing, talking on the telephone and sometimes, even conversations.

I submit that it is an imposition on the communities of Southwest Boston and neighboring towns to construct Runway 14/32 which will triple the air traffic over those areas. The communities affected are densely populated, and it seems to me unfair to further burden those communities with noise and pollution. 388.1

There is an airport at Hanscom Field that is underutilized and could be developed. Fewer homes would be affected. 388.2

It is mainly small aircraft that cause congestion at Logan. I believe that you should experiment with peak time pricing to keep down the volume of air traffic and reduce delays in the short term, and develop a second regional airport as a long term solution. 388.3

388.1	Alternatives	Runway 14/32	...Runway 14/32...will triple the air traffic over [the communities of Southwest Boston]...The communities affected are densely populated, and it seems to me unfair to further burden those communities with noise and pollution.	Implementation of Runway 14/32 would not result in substantial noise impacts in any community. Rather, it would enable the air traffic controllers to adhere more closely to the PRAS goals and decrease the population that is most severely affected. For example, implementation of the Preferred Alternative will reduce the population affected by Day-Night Sound Level values greater than 70 dB by four percent with the 29 M Low Fleet scenario, by 67 percent with the 37.5 M High Fleet scenario, and by 39 percent with the High Regional Jet Fleet, while increasing the population exposed to Day-Night Sound Level values greater than 65 dB by two percent, zero percent, and three percent for these three fleet scenarios, respectively. Refer to Section 6.2 of the Supplemental DEIS/FEIR and population counts presented in Tables 6.2-3 through 6.2-8 of the Supplemental DEIS/FEIR.
388.2	Regional Transportation	Regional Airports	There is an airport at Hanscom Field that is underutilized and could be developed. Fewer homes would be affected.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR, specifically considered the role of Hanscom Field in the analysis of regional alternatives. Hanscom Field, which serves as a general aviation reliever airport to Logan Airport, already accommodates a significant number of aircraft operations (183,000 operations in 1998). The Hanscom Field activity includes private, business, charter, and air taxi operations that might otherwise use Logan Airport. Code	Topic 1	Topic 2	Comment	Response
388.3	Alternatives	Peak Period Pricing	....you should experiment with peak time pricing to keep down the volume of air traffic and reduce delays in the short term,...	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR contain an analysis of PPP as a demand management alternative at Logan Airport. The analysis indicates that PPP is an effective option when airlines schedule beyond the normal hourly operating capacity of the airport, and provides an assessment of the extent of the benefits from PPP under such circumstances. See Section 4.5 of the Supplemental DEIS/FEIR.

LETTER 389

Arthur Pugsley
Exec. Office of Environmental Affairs
Atten: M.E.P.A. file #10458
100 Cambridge St. 20th floor
Boston, Mass. 02202

4-14-99

Dear Mr. Pugsley,

I am writing to you as a resident of the West Roxbury section of the city of Boston and as an environmental educator who works with urban school children.

As a resident I oppose the proposed new runway for the following reasons which affect my, my family's and my community's quality of life.

1. Currently planes dump fuel before landing over my home eventhough this is not supposed to happen. You might ask how I know this. I work at home and often take a break by going into my yard. It is during these times that I smell airplane fuel, a smell familiar to me from my numerous trips to airports. At first I thought it could be from a truck but no trucks were in the area. I would then look up and notice that a plane had just flown over. Thus I came to this conclusion. Because of this experience I have no faith in Massport's ability to enforce regulations which affect our environment. It appears to me that the public is told whatever they need to hear and then it is business as usual. 389.1
2. I use Forest Hills Cemetery in Jamaica Plain and Franklin Park in Dorchester as outdoor classrooms for environmental education for students from the Boston Public Schools and private schools. Often the roar of planes overhead mars their experience. We must stop what we are doing and wait until the noise stops. These children live in the city where this type of education is so important. Many of them do not have access to the environment other than these experiences. The new runway would only make this problem worse. Do not these children have the right to enjoy the quiet of nature like many of their suburban counterparts? They have a right to hear birds sing and listen to the rustle of leaves. By learning about the environment these students will become the caretakers of our urban centers during the twenty first century. Please do not take away their future. 389.2

I urge you not to approve the building of the new runway. I feel that planes should be diverted to Hanscom Field. Yes, problems exist with access to this field but I believe our planners at Massport could work out a solution if the were committed to this approach. Other major cities have airports along the inner beltway in addition to the core of the city. The burden of air traffic needs to be spread out throughout Eastern Massachusetts. 389.3

Sincerely,

Andrea Taaffe

Andrea Taaffe

Letter 389
Andrea Taaffe

Code	Topic 1	Topic 2	Comment	Response
389.1	Air Quality	Emissions	...I oppose the proposed new runway [because]: 1. Currently planes dump fuel before landing over my home....	Fuel dumping (dropping) typically occurs only in aircraft emergencies. Air traffic control makes every effort to direct the pilot away from residential and other populated areas during this procedure. Notwithstanding the above, the Federal Aviation Administration (FAA) requirements allow fuel dumping at or above an altitude of 2,000 feet. This distance above ground allows much of the fuel to evaporate and disperse. Thus, emergency fuel dumping should have little or no impact on human health and welfare.
389.2	Noise	Impacts	...I oppose the proposed new runway [because]: 2. ....The new runway would only make...[noise over Franklin Park] worse....	The Supplemental DEIS/FEIR contains additional analysis of the project relative to parklands. As depicted in Figure 6.3-4 of the Supplemental DEIS/FEIR, the Arnold Arboretum, Emerald Necklace, and Franklin Park are well outside the 65 dB DNL noise contour associated with the Preferred Alternative. Therefore, the Airside Project will have no impact on these parklands. In addition, the Boston Harbor Islands, while within the No Action Alternative 65 dB DNL noise contour, will have no noise increase under the Preferred Alternative. Refer to Section 6.3 of the Supplemental DEIS/FEIR for additional discussion of parklands.
389.3	Regional Transportation	Regional Airports	....The burden of air traffic needs to be spread out throughout eastern Massachusetts.	Chapter 2 of the Supplemental DEIS/FEIR provides a discussion of the specific role played by the regional transportation alternatives and steps that Massport has taken to foster use of these alternatives. Massport has long recognized and has been a proponent of options to Logan Airport. Together with the regional airports, Massport has implemented a regional strategy to enhance the use of options to Logan Airport. In the Airside Project Draft EIS/EIR, Massport identified up to 7.3 million annual passengers that could be absorbed by regional alternatives that include use of T.F. Green/Providence, Manchester and Worcester Regional airports, as well as the new high-speed rail to New York. In the Supplemental DEIS/FEIR, Massport recognizes that these developments will slow Logan Airport's passenger traffic growth. Logan Airport may not achieve the 37.5 million passenger forecasts until after 2010, but rather closer to 2015, and the 45 million passenger forecasts may not be achieved until after 2020. While regional alternatives can play an important role in reducing the rate of future traffic growth at Logan Airport, they do not address Logan Airport's inability to efficiently accommodate current levels of demand during northwest wind conditions. Runway 14/32, which is designed to correct the problem with Logan Airport's layout, is necessary to correct this deficiency and provides clear benefits at current aircraft traffic levels. These benefits will only increase in the future, even as developments at the regional airports act to reduce the rate of future growth at Logan Airport.

LETTER 390

Ronald A. Fama

April 22, 1999

Secretary of Environmental Affairs
ATT; Mr. Arthur Pugsley
MEPA Office – EOEA-NO 10458
100 Cambridge Street – 20th Floor
Boston, MA 02202

Dear Mr. Pugsley:

The enclosed documentation represents an example of the abuse sustained by East Weymouth and the South Shore in general. There is no reason to believe that a new runway will not exacerbate an already intolerable condition. 390.1

I will contact your office with more complete data and information but I just wanted to give you some idea of the battering and degraded citizenship we now endure. Something must be done to alleviate the current suffering and I urge you to interfere in any way possible to stop the proposed additional runway 14-33. I will be in contact with you as soon as possible. Feel free to contact me at the above telephone number.

Thank you.

Sincerely yours,

Ronald A. Fama

Departure

Aircraft Disturbance Report

of records?

Person Reporting Disturbance:

Mr. Ron Fama
11 St Anne Road
Weymouth, MA 02189

Telephone: 340-0386

Disturbance Date and Time: 10:15 on 12 Jan 99 to
10:15 on 12 Jan 99

Conditions:

Wind Direction:	230 deg	**Wind Speed:**	16 Knots
Ceiling:	15000 Ft	**Visibility:**	10.0 Miles

Runways in Use:

Arrivals: 27 - 22L
Departures: 22R - 22L

Complaint Description: I would like the runway logs for arrivals and departures from 5 am to 10 am. I would also like the altitudes of each operation. This is going to Senator Kerry's office.

Massport Report of Investigation: The information you requested is enclosed. The FAA has been notified of your concerns by copy of this complaint.

Massport Reporter: Noise Abatement Office

Send Copy: Yes

Aircraft Disturbance Report

Person Reporting Disturbance:

Mr. Ron Fama
11 St Anne Road
Weymouth, MA 02189

Telephone: 340-0386

Disturbance Date and Time: 20:52 on 12 Jan 99 to 20:52 on 12 Jan 99

Conditions:

Wind Direction:	220 deg	**Wind Speed:**	8 Knots
Ceiling:	11000 Ft	**Visibility:**	10.0 Miles

Runways in Use:

Arrivals:	27 - 22L
Departures:	22R - 22L

Complaint Description: There is too much air traffic.

Massport Report of Investigation: You are affected by jet departures on Runway 22R, in use with southwesterly winds. A change of runway configuration occurred at midnight.

Massport Reporter: Arduino Parravano/NAO

Send Copy: Yes

cc: FAA Boston Tower Chief

Code	Topic 1	Topic 2	Comment	Response
390.1	Noise	Impacts	... There is no reason to believe that a new runway will not exacerbate intolerable [noise] condition...[in East Weymouth and on the South Shore]	In 1998, 77 percent of Logan Airport's jet traffic affected communities to the north and south of the airport—East Boston, Winthrop, Revere, parts of South Boston, Dorchester, Quincy, Milton, and Braintree. Without Runway 14/32, as much as 88 percent of Logan Airport's aircraft operations will overfly these communities when Logan Airport reaches 37.5 million passengers. Construction of Runway 14/32 will allow a more balanced geographic distribution of aircraft operations over populated areas, will increase the number of over-water operations, and will reduce noise exposure for close-in communities. In fact, the most heavily impacted communities will experience a decrease in overflights compared to 1998 levels. With the Preferred Alternative, when Logan Airport reaches 29 million passengers, overflights from Runway 4 arrivals and Runway 22 departures, which affect South Boston, Quincy, Milton, and Braintree, will decrease from 107,861 in 1998 to 58,305 operations.

LETTER 391

Dr. Mr. Pugsley,

I'm not sure why I received this email, but since I did I might as well make my opinion known. I think that Logan SHOULD be able to expand in order to accommodate more travelers, especially if it will lower airfare. I realize that air noise is a concern, but they should have thought of that before they moved in next to the airport. 391.1

Michele LaMura
Manchester, MA

Subject: STOP MASSPORT/LOGAN 14/32 RUNWAY EXPANSION

DEAR MR. ARTHUR PUGSLEY:
(MASS ENVIRONMENTAL AFFAIRS UNIT DIRECTOR)
I STRONGLY REQUEST THAT YOU REFUSE TO APPROVE THE MASSPORT ENVIRONMENTAL REPORT ON THE PROPOSED 14/32 RUNWAY EXPANSION AT LOGAN AIRPORT.
I BELIEVE THE MASSPORT SUBMISSION IS INCOMPLETE AND CONTAINS MANY MISLEADING
HALF TRUTHS. MANY OF THE DATA SOURCES ARE QUESTIONABLE, OUT DATED AND INCORRECT.
I FEEL ANY FURTHER EXPANSION OF OPERATIONS, FLIGHTS IN AND OUT, WILL DIFFINETLY CAUSE A TREMENDOUS NEGATIVE ENVIRONMENT IMPACT ON THOSE OF US WHO LIVE, WORK AND GO TO SCHOOLS IN THE VERY DENSELY POPULATED COMMUNITIES SURROUNDING LOGAN AIRPORT.
I ASK YOU TO REMAIN OPEN AND SENSITIVE THE OUR BASIC QUALITY OF LIFE DAMENTALS, "EXCESSIVE NOISE OVER OUR HEADS DAY AND NIGHT, ALONG WITH BAD EMISSIONS ARE STEALING OUR BASIC RIGHTS." WE NEED YOUR HELP AND OTECTION.
OUR PEACEFUL AND HEALTHY FUTURE IS IN YOUR HANDS.

Boston, MA

RE: Massport's Proposed Runway 14/32 and Centerfield Taxiway

Dear Mr. Pugsley,

I recently submitted two videotapes to you. One is a tape of the Joint Committee on Transportation Hearing held at the State House on March 23. Representative Bob DeLeo of Winthrop and others have filed legislation which would forbid the construction of these two projects and which would establish a regional planning approach to the needs for airports in the next decades. I support this legislation. The second videotape is the MEPA hearing held at the Holiday Inn in East Boston on April 8th. You will notice that Mr. Silva gave an incorrect zip code. Both tapes are almost gavel-to-gavel with the exception of the few minutes it took to change tapes. There are no speakers omitted from these tapes - both meetings were taped without any "editing out." If you want additional copies, please call me at 617-846-7418. I am a volunteer producer at Winthrop Community Access Television as well as a member of Winthrop's Air Issues Resolution (AIR) Committee.

I am opposed to the construction of Runway 14/32 and the taxiway as proposed by Massport. I am concerned about the current levels of air pollution generated by the airport, and more concerned about the impacts of additional flights over our neighborhoods. Anyone can see the smog that sits over the airport on a summer day. Anyone can see the exhaust emissions of planes as they take off. Anyone can see the emissions as the planes rev their engines on the taxiway waiting to take off. This particulate matter, as you know, comes down in residential neighborhoods in and around the city of Boston. It is no mystery to me why the rates of asthma and respiratory disease in our communities are startlingly high. If a health study were conducted which proves a connection can be made between these conditions and air pollution at Logan, we should not only plan no future expansion at Logan, we should plan reduction of flights into and out of any airport in a densely populated residential area. 392.1

Massport's executives lied to the people Winthrop when Peter Blute and Betty Desrosiers referred to a Massport-sponsored health study that is being conducted by the Harvard School of Public Health. Many people with many contacts at that prestigious school have tried unsuccessfully to track down details of the alleged study. We concluded there isn't any Massport study.

I am also opposed to the runway and taxiway on the grounds of unacceptable noise levels. Noise levels of close to 65db after 10PM and before 7AM should not be tolerated by any residential community. Cargo flights should be stage III aircraft only or directed to other airports. Winthrop residents who live under existing runways now tolerate additional cargo flights at all hours of the day and throughout the night. No corporation motivated by profit and or governmental agency charged with protecting the "public good" should be allowed to violate our right to "life, liberty 392.2

and the pursuit of happiness" by polluting our air, causing disease and filling the neighborhood with noise.

I don't believe we should wait until a local study finds that students in schools under flight paths have impaired learning due to constant interruption from noise. European studies have already proven this. We don't need to wait until a local study finds higher incidences of certain cancers among residents near Logan. Studies in Seattle-Tacoma and at Cape Cod have already determined that. State Senator Steve Lynch of South Boston stated at the recent State House Rally against the Runway that the respiratory illness rate in his community is 61% higher than the state average. 392.3

The smell of jet fuel in the air over Winthrop has dramatically increased in the past few years. We should not be subjected to any jet fumes at all. The prospect of additional large aircraft flights and their jet fuel odor throughout the Logan community will absolutely lead to additional community opposition. You can be sure the recently-formed organization, Communities Against Runway Expansion (CARE), will gain in strength and visibility and will take more actions to oppose this further threat to health from jet fuel. Health studies of veterans of Operation Desert Storm/Desert Shield are being conducted which some scientists believe may find a causal relationship between exposure to jet fuel contamination and the incidence of many debilitating diseases.

I oppose this Runway and Taxiway project as a resident of Winthrop, a member of the Friends of Belle Isle Marsh, the Winthrop AIR Committee, and a community environmental activist. We need a regional planning process. I believe the impacts of an additional runway and taxiway are also a threat to the delicate balance of plants, animals, fish and other wildlife that depend on a clean and healthy environment to live. 392.4

As you recall, the MWRA was created in response to a consent decree. We now applaud the courageous actions by the executive, judicial, and legislative leaders who created and supported that agency. Consequently, the water quality in our harbor has improved and the health of the harbor's wildlife has vastly improved.

Perhaps the formation of a regional planning agency will be the final result of this "conflict" and we will ultimately applaud the actions of all the agencies involved who recognized the political problem and had the vision to solve it.

Sincerely,

Barbara Bishop

Code	Topic 1	Topic 2	Comment	Response
392.1	Air Quality	Model	....I am concerned about the current levels of air pollution generated by the airport, and more concerned about the impacts of additional flights over our neighborhoods. ....It is no mystery to me why the rates of asthma and respiratory disease in our communities are startlingly high. if there is a connection between these conditions and air pollution from Logan, we should plan no future expansion ...reduction of flights	Public health issues are discussed further in Section 6.8 of the Supplemental DEIS/FEIR. No alternatives violate the NAAQS. The Preferred Alternative shows better air quality results than the other alternatives. Massport is separately studying measures for reducing Logan Airport's contribution to air emissions in the region, in the *Logan Airport 1999 ESPR* (previously GEIR). Consideration is given to all emissions sources, and analysis is conducted for the airport, East Boston and regional study areas.
392.2	Noise	Runway 14/32	I am also opposed to the runway and taxiway on the grounds of unacceptable noise levels. Noise levels of close to 65db after 10PM and before 7AM should not be tolerated in any residential community.	Refer to response to Comment 392.1. The Night Equivalent Sound Level (LeqN) was calculated at 23 selected locations for all fleets and scenarios. Table 6.2.15 and 6.2.16 of the Supplemental DEIS/FEIR report these data for the 29M Low and 37.5M High Fleet scenarios of the Supplemental DEIS/FEIR. The results show that, at most locations, the LeqN for the future fleets is lower than for the 1993 case. Where there is an increase in LeqN, the reason was the increase in flights for the No Action Alternative, which generally was mitigated by the Preferred Alternative. These results indicate that there will be less sleep disturbance in the future than that currently experienced. Refer to Section 7.4 of the Supplemental DEIS/FEIR for a discussion of cumulative noise impacts.
392.3	Public Health	Effects	....We don't need to wait until a local study finds higher incidences of certain cancers among residents near Logan. ...the respiratory illness rate in his community is 61% higher than the state average.	The available public health studies for communities adjacent to Logan Airport were reviewed and are presented in Section 6.8 of the Supplemental DEIS/FEIR. Public health status reports were available for the City of Boston; however, comparable public health reports were not available from the Public Health Departments of Chelsea, Revere, and Winthrop. A review of the available information did not indicate any causal relationship based on proximity to the airport, nor did it identify hearing loss as a public health concern.
392.4	Alternatives	Runway 14/32	....an additional runway and taxiway are also a threat to the delicate balance of plants, animals, fish and other wildlife that depend on a clean and healthy environment to live.	The increase in impervious surface area will reduce habitat for several species (refer to Section 6.5 of the Supplemental DEIS/FEIR). A mitigation plan has been developed to offset impacts to the state-listed Upland Sandpiper population (refer to Section 6.5 of the Supplemental DEIS/FEIR). Runoff quality will be unchanged from current airfield conditions.

LETTER 393

April 8, 1999

Mr Rugsley

As a resident of Winthrop for 35 years I felt it was time to voice my concerns regarding the quality of life in our town. Bottom line... there is more! It's gotten progressively worse, more noticeable to me in the past two years.

The noise is so constant it's deafening. A southwest wind in my area means the absolute constant whining of planes landing - the reverse thrust of the engines you can practically feel as well as hear.

Take-offs have been very interesting also. Since October of 98 they now come just about over my house - something they haven't done in the 19 years I have owned this house... why is that I'd like to know? They are over this whole town like they've never been before. 393.1

My diesel fumes are atrocious. Fresh air is a thing of the past. You can't be outside and you can't leave the windows open... what's left?! Soot is just every- 393.2

sills, on the cars, they coat my pool the patio furniture, my kids toys in the yard! We were told years ago not to plant edibles in the soil around here because of that.

What more can we say? Winthrop is a lovely town - or was! We are being overrun by the airport. Yes, we chose to live here, or should I say our parents did, when it wasn't so bad. We grew up here, my children are growing up here, I'd like my grandchildren to grow up here if they choose, etc., etc. If we cannot come to a better living arrangement with Logan then we have to take a stand and say no to any new runways or any other expansion projects - we just can't take it any more! Please help us on these issues we are truly nice people, average folks who can co-exist with Logan - as we have for years! What we need is no added traffic and a share of this burden to other areas.

Thank you and we appreciate any help you can give us.

Cordially

Nancy J Crombie

57 Palmyra St, Winthrop

Code	Topic 1	Topic 2	Comment	Response
393.1	Noise	Runway Use	Take-offs... [s]ince October of 98 ...now come just about over my house--something they haven't done in the 16 years...They are over this whole town like they've never been before.	PRAS noise goals are based on the fact that DNL levels above 75 dB are considered unacceptable for residential land use and that DNL levels above 70 dB are also excessively high and should be reduced if feasible. PRAS recommendations are thus designed to shift operations off of runways where these high levels still exist – primarily in Winthrop and to the north of Logan Airport in East Boston and Revere.
393.2	Air Quality	Impacts	The diesel fumes are atrocious....	The Airside Project leads to a decrease in odor-causing hydrocarbon emissions, when compared to the No Action Alternative. This is illustrated in Table 6.4-7 and Figure 6.4-5 of the Supplemental DEIS/FEIR. However, decreases in odorous emission concentrations will be imperceptible.

LETTER 394

Dear Mr. Pugsley, 4-5-99

I am writting to you in an attempt to appeal to your sense of human decency. Nine years ago, I had purchased a "home" in what was considered the better part of Winthrop called the Highlands. The houses in this section are not glamous nor are they larger than any others, but are simply more desirable because of their prolimity to Logan Airport. The Highlands is the furthest most point of Winthrop from Logan Airport. The main air traffic corridors do not pass direcly above but more directly over my fellow neighbors in Beachmont, approximately four blocks away. I find it somewhat amazing people consider my location more fortunate due to a distance of four small blocks.

Within the last five years, the increased numb. of flights and noise has become horific. The day time hours are consumed with take-offs and landings accompanied by the constant roar of warming jet engines on the tarmac. The night time hours only bring more of the same but seem endless due to the tossing and turning to get some sleep.

During the summer months, I look forward to the winter when my windows will be closed thus giving some relief from the noise and smell of burning jet fuel.

When winter finally arrives, no relief is to be found because my now closed windows rattle with the rumblings of airplanes. Sadly, I have found Winthrop has no peaceful neighborhoods, no quiet times when a family can go outside to enjoy themselves No community should be so dramatically impacted by an airport.

Presently the health of my family and I appears to be OK but we believe it's only due to our relatively young ages. We fear it may only be a matter of time before the impact of the airport effects our physical health.

In closing, allow me to point out Logan Airport is unlike any other major airport due to it's very close proximity to the surrounding communities. Due to this simple 394.1
fact, the health of our communities are suffering and further health studies must be initiated. Would you please ensure these studies move forward for the sake of the thousands of people who deserve a healthier quality of life.

Sincerely

Gregory DePatto

394.1	Noise	Impacts	...Logan Airport is unlike any other major airport due to its very close proximity to the surrounding communities. Due to this simple fact, the health of our communities are suffering and further health studies must be initiated.	The available public health studies for communities adjacent to Logan Airport were reviewed and are presented in Section 6.8 of the Supplemental DEIS/FEIR. Public health status reports were available for the City of Boston; however, comparable public health reports were not available from the Public Health Departments of Chelsea, Revere, and Winthrop. A review of the available information did not indicate any causal relationship based on proximity to the airport, nor did it identify hearing loss as a public health concern.

LETTER 395

291 Winthrop Street
Winthrop, MA 02152
April 6, 1999

Mr. Robert Durand, Secretary
Executive Office of Environmental Affairs
100 Cambridge Street - Room 2000
Boston MA 02202

Dear Mr. Durand:

I am writing to state my firm opposition to the construction of runway 14/32 at Boston's Logan International Airport.

There are three factors that must be taken into consideration when one thinks about any expansion of facilities at Logan, factors that weigh heavily on the quality of life of those of us who are neighbors to the airport. These factors are noise, pollution, and safety.

We all have a right to life uninterrupted and unhindered by the onslaught of excessive noise. We choose to live in a major metropolitan area and, with the turf, comes a certain amount of noise. When the level of noise becomes a health hazard, though, interrupting sleep and disrupting periods of relaxation, we have a right to recourse. The level of noise at Logan, emanating both from planes revving on the runways and from aircraft in takeoff and landing patterns is excessive. No, the soundproofing program offered to many in Winthrop and surrounding areas is not an acceptable solution to the noise problem. We are people who like to live outside of our homes during the summer months, not in a cocoon. 395.1

The pollution with which we have to contend is also unacceptable and obviously hazardous. The soot that collects on my lawn furniture clearly comes from the airplanes that fly overhead. Although the folks who run the airport would have us believe that the deleterious effects of what they put into the air are overstated, I cannot help but wonder how the black film that covers my furniture is affecting my lungs. In the absence of a study of the effects of this pollution on the neighbors of Logan, any thought of airport expansion is unconscionable. 395.2

Finally, we are concerned about safety, the ultimate environmental issue. Planes are allowed to fly, in random patterns, over my town, the most densely populated town in the Commonwealth. I shudder to think that we are statistically overdue for a plane to drop from the sky with disastrous effects, destroying life and property. It is nearly forty years since the Electra, its engine choked by starlings, landed in the narrow channel between Winthrop and the airport. We all remember the small plane that, in the early morning hours on final approach to Logan, fell onto a crowed Londsdale Street in Dorchester, destroying several houses but miraculously killing none of the inhabitants. We in Boston and environs have been fortunate. Is it only a matter of time before we are the lead story on the network news? 395.3

I just last week spent a vacation in Orlando (Florida). The airport there is fully thirty minutes from the largest tourist attraction in the area, DisneyWorld. I can tell you, from firsthand experience, that the thirty minute drive does not deter people from coming to visit the magical world of Walt Disney. Boston will be no less a first class city without the expansion of Logan International Airport. Regionalization of transportation facilities will do nothing to diminish the attractiveness of Boston as a destination for tourists and conventioneers. The airport need not be within two miles of downtown Boston in order to attract visitors. Witness Orlando, witness Denver, witness countless other sites.

Let's take a long, hard look at the alternatives to expanding Logan before we take some steps that might be irreversible and that we might regret. Let's look at these alternative NOW so that ten or twenty years from now we might not find ourselves in the same bind, running out of space and decrying the lack of time to plan for regional solutions to a regional problem. 395.4

Thank you for your consideration of my thoughts.

With very best wishes, I am

Sincerely,

Richard D. Gill

Code	Topic 1	Topic 2	Comment	Response
395.1	Noise	Sound Insulation	....The level of noise at Logan, emanating both from planes revving on the runways and from aircraft in takeoff and landing patterns is excessive. No, the soundproofing program offered to many in Winthrop and surrounding areas is not an acceptable solution....	Massport's FAA-approved sound insulation program is only one element of the noise abatement program. For a discussion of the noise abatement program, refer to the discussion in the *Logan Airport 1994/1995 GEIR* and the *Logan Airport 1998 Annual Update*. Massport has existing actions initiatives underway that reduce noise impacts on nearby communities, including: Noise abatement and runway use restrictions; Exploring means of extending the Logan Airport sound insulation program through innovative investigation of hill effects on sound propagation; Encouraging growth at Worcester Regional Airport and other alternative airports; and Monitoring and improving achievement of PRAS goals.
395.2	Air Quality	Impacts	The [air] pollution with which we have to contend is also unacceptable and obviously hazardous. ....I cannot help but wonder how the black film that covers my furniture is affecting my lungs....	The PM_{10} in urban areas comprises compounds from a variety of sources, primarily roadways. The dispersion modeling for the Airside Project indicates there will be no violations of the NAAQS for fine particulates (PM_{10}). The modeling included Logan Airport emissions and background emissions.
395.3	Alternatives	Runway Use	...we are concerned about safety... Planes are allowed to fly, in random patterns, over my town, the most densely populated town in the Commonwealth....	Although it may not be apparent from the ground, aircraft flight paths to/from Logan Airport are anything but random. They are closely controlled to follow specific paths depending on the aircraft type, runway, weather, and other factors. Massport, the FAA, the airlines, and the communities have devoted enormous effort over the past 40 years to develop flight tracks that meet all safety standards and attempt to minimize the population exposed to overflights and noise.

Code	Topic 1	Topic 2	Comment	Response
395.4	Regional Transportation	Regional Airports	Let's take a long, hard look at alternatives to expanding Logan...so that ten or twenty years from now we might not find ourselves in the same bind, running out of space and decrying the lack of time to plan for regional solutions to a regional problem.	Chapter 2 of the Supplemental DEIS/FEIR provides a discussion of the specific role played by the regional transportation alternatives and steps that Massport has taken to foster use of these alternatives. Massport has long recognized and has been a proponent of options to Logan Airport. Together with the regional airports, Massport has implemented a regional strategy to enhance the use of options to Logan Airport. In the Airside Project Draft EIS/EIR, Massport identified up to 7.3 million annual passengers that could be absorbed by regional alternatives that include use of T.F. Green/Providence, Manchester and Worcester Regional airports, as well as the new high-speed rail to New York. In the Supplemental DEIS/FEIR, Massport recognizes that these developments will slow Logan Airport's passenger traffic growth. Logan Airport may not achieve the 37.5 million passenger forecasts until after 2010, but rather closer to 2015, and the 45 million passenger forecasts may not be achieved until after 2020. While regional alternatives can play an important role in reducing the rate of future traffic growth at Logan Airport, they do not address Logan Airport's inability to efficiently accommodate current levels of demand during northwest wind conditions. Runway 14/32, which is designed to correct the problem with Logan Airport's layout, is necessary to correct this deficiency and provides clear benefits at current aircraft traffic levels. These benefits will only increase in the future, even as developments at the regional airports act to reduce the rate of future growth at Logan Airport.

396.1	Environmental Review Process	MEPA	[Asks MEPA to review] misleading, deceptive and self serving methods used by Mass Port to obtain the desired results of their environmental reports... Example: "Percentage of Runway Use," Runway 9/27: Massport--60%, Actual--90%	The Secretary of Environmental Affairs found that "...the Draft Environmental Impact Report (DEIR) submitted on this project adequately and properly complies with the Massachusetts Environmental Policy Act...". Refer to the Certificate of the Secretary of Environmental Affairs on the DEIR, dated May 7, 1999.

LETTER 397

41 Beal Street
Winthrop, MA 02152
April 8, 1999

Arthur Pugsley
Secretary of Envirnmental Affairs
100 Cambridge Street
Boston, MA 02025

Dear Mr. Pugsley and Members:

I would like to express my concern with the health issues at Logan Airport.

I think it is important to keep in mind that the airport is located in the middle of the city.

The residents have already been over burdened by the low flying planes, the smell of fumes, along with the soot and the dumping of fuel in our water. It took many years to get our harbor cleaned. 397.1

The cost of cleaning was extensive, and we would like the harbor to remain clean and free from these toxins.

We seldom get relief from the landings and take offs, and when we do then we have to contend with the sound of the motors running all hours of the day and night and the planes taxiing on the runways. This also causes pollution. 397.2

Our traffic problems in the surrounding areas are horrendous due to Logan Airport. I feel that we have taken enough of this unhealthy situation. 397.3

It is almost impossible to talk on the telephone or watch a television program when the planes are flying so close to the tops of our homes.

And last but not least, this situation causes me much stress and irritability. 397.4

I sincerely hope that you will take into consideration our health when making your decision in this important matter.

Cordially,

Eleanora Olivolo

Eleanora Olivolo

Code	Topic 1	Topic 2	Comment	Response
397.1	Air Quality	Impacts	The residents have already been overburdened by ... the smell of fumes, along with the soot and the dumping of fuel in our water. ...	The Airside Project leads to a decrease in odor-causing hydrocarbon emissions, when compared to the No Action Alternative. This is illustrated in Table 6.4-7 and Figure 6.4-5 of the Supplemental DEIS/FEIR. However, decreases in odorous emission concentrations will be imperceptible. The PM_{10} in urban areas comprises compounds from a variety of sources, primarily roadways. The dispersion modeling for the Airside Project indicates there will be no violations of the NAAQS for fine particulates (PM_{10}). The modeling included Logan Airport emissions and background emissions. Fuel dumping (dropping) typically occurs only in aircraft emergencies. Air traffic control makes every effort to direct the pilot away from residential and other populated areas during this procedure. Notwithstanding the above, the Federal Aviation Administration (FAA) requirements allow fuel dumping at or above an altitude of 2,000 feet. This distance above ground allows much of the fuel to evaporate and disperse. Thus, emergency fuel dumping should have little or no impact on human health and welfare.
397.2	Noise	Impacts	We seldom get relief from the landings and take offs, and when we do then we have to contend with the sound of the [aircraft] motors running all hours of the day and night and the planes taxiing on the runways..	In 1998, 77 percent of Logan Airport's jet traffic affected communities to the north and south of the airport—East Boston, Winthrop, Revere, parts of South Boston, Dorchester, Quincy, Milton, and Braintree. Without Runway 14/32, as much as 88 percent of Logan Airport's aircraft operations will overfly these communities when Logan Airport reaches 37.5 million passengers. Construction of Runway 14/32 will allow a more balanced geographic distribution of aircraft operations over populated areas, will increase the number of over-water operations, and will reduce noise exposure for close-in communities. In fact, the most heavily impacted communities will experience a decrease in overflights compared to 1998 levels. With the Preferred Alternative, when Logan Airport reaches 29 million passengers, overflights from Runway 4 arrivals and Runway 22 departures, which affect South Boston, Quincy, Milton, and Braintree, will decrease from 107,861 in 1998 to 58,305 operations. The purpose of the proposed Centerfield Taxiway system is to improve the flow of taxiing aircraft and to reduce aircraft ground delay. With the Centerfield Taxiway in place, neighbors in Winthrop and East Boston adjacent to the taxiways will experience small reductions in ground noise. These are different from the noise level reductions that occur in parts of East Boston, Revere, South Boston, and Dorchester with the Preferred Alternative. Improvements in those communities are derived from the added flexibility afforded by Runway 14/32. It allows the redistribution of traffic so that there are fewer landings on Runway 4L and 4R and fewer takeoffs on Runways 22L and 22R. The taxiway itself has no bearing on these flights.

Code	Topic 1	Topic 2	Comment	Response
397.3	Ground Transportation	Access to Logan	Our traffic problems in the surrounding areas are horrendous due to Logan Airport.	The Preferred Alternative is not expected to lead to an increase in passenger demand, and therefore, it will have no effect on congestion or delays on Boston area highways. Refer to Section 4.2 of the Supplemental DEIS/FEIR.
397.4	Public Health	Effects	...[the current] situation causes me much stress and irritability.	Comment noted.

LETTER 398

April 19, 1999

RE LOGAN AIRSIDE IMPROVEMENT
PLANNING PROJECT

Bob Durand, Secretary
Executive Office of Environmental Affairs, Attention: MEPA Office
Attn. Arthur Pugsley, EOEA No. 10458
100 Cambridge Street – 20th Floor
Boston, MA 02202

Runway 14/32 is not the issue for Massport and the people. The true number involved is 120. Mr. Blute made clear upon questioning after his presentation in Winthrop that yes, Logan Airport is not able to attain the allowed FAA goal of 120 flights an hour at present – but could approach that goal with the construction of 14/32 , the center taxiway and related improvements.

Questions of facts as construed by Massport:

DELAYS are largely attributed by Massport to Northwest winds which limit runway use, truly a specious argument.

According to the Coastal Pilot I for Boston Harbor, northwest winds (including WNW, NW and NNW) occurr 9.6% of the time. They are most frequent in winter, which is also the time of delays because of snow, sleet and other winter conditions not only at Logan, but also throughout the northeast and midwest as well as Canada and Europe.

In winter, the mean speed of the northwesterly winds in Boston ranges from 11.4K in October to 13.9K in March. Obviously some of these winds will be above the 15K threshold requiring use of runways allowing landings and takeoffs into the wind. It is also evident that the northwest winds cannot be blamed for most of Logan's delays. 398.1

Even if northwest winds were responsible for the alleged delays, construction of a runway limited to overwater flights would be of no use in takeoffs into northwest winds when the runway heads 320, though 140 landings into the wind could be made over water.

If the delays are to be alleviated by putting smaller planes on 14/32 and freeing up 15/33, again takeoffs would be over land.

Most of us who have done extensive travel by air know that some delay is built into timetables. Family members in Bedford who travel extensively world-wide on business think nothing of a 15 – 30 minute delay out of a five or 14 hour flight. They could as easily drive to Manchester or

Pease, avoiding the nightmare traffic getting to Logan. (Assuming Hanscom is used for smaller planes such as might use 14/32.)

SIDELINE VIBRATIONS AND STABILITY:
According to the U.S. Geological Survey (C.A. Kaye, Bulletin #1476, 1976), Logan Airport is based on glacial clays dredged from the Boston Harbor, with thick mud slurry pumped into settling basins. This has caused major problems at airfields in earthquake zones in other parts of the world. Knowing that our area is a prime earthquake zone, what provisions are made ?

Surely it would be better to spread the traffic around the region so that the odds of all air transportation being severely affected by an earthquake would be sharply reduced. 398.2

My 115-year old home on the Harbor is built like Gibraltar, yet the frequency and vigor of side-line vibration have increased drastically in the last few years. According to a random batch of reports from Logan, cases affecting my home are due to arrivals or departure on 9, 22, 27 and 33, usually in light to moderate winds. The aircraft involved have been the B727, B737, B757, MD 11 and cargo planes. Progress in quiet performance is not reducing side-line vibration and may be increasing it. I never used to feel the tremble up from the floor through my feet, and to hands and the computer keyboard until recently. In the neighborhood, we all have to put breakables in closed cabinets or otherwise secure so they won't bounce off shelves. What is this doing to the structure of the house? I have earthquake insurance, but it doesn't cover Logan-quake. 398.3

OTHER EFFECTS: In addition to noise, the increased traffic will increase both air and water pollution, neither of which has been effectively monitored over the years. According to the Air Travel Journal, March taxi cab trips from Logan were 40,000 above average. The proposed new cargo warehouses along Route 1A will add many truck trips each day, not to mention the traffic effects of the proposed new hotels near Logan. Yet we are already trapped by highway gridlock. 398.4

POSSIBLE IMPACTS ON SHELLFISH: The clam flats around Logan Airport have been the most productive clam flats north of Boston for most the the past 15 years, at least. (I do not have statistics for south of Boston soft shell clams production.) 398.5

At present all clams harvested around Logan Airport must be landed in Winthrop, according to Mass. Division of Marine Fisheries procedures, from whence they are monitored to the Newburyport depuration plant for self-cleansing in clean tidal water under UV lights before being released for public sale. As the Harbor becomes cleaner, it is possible that the 'moderate contamination' rating of the flats may be lifted, allowing direct sale to users.

Last year the Winthrop Town Meeting unanimously adopted Shellfish Rules and Regulations, developed in cooperation of the Winthrop Harbor Management Committee with the Massachusetts Division of Marine Fisheries. Winthrop is preparing to take over management of its flats from the State, to improve harvesting rotation and to develop a seeding/ growth management program not now possible with the state's limited manpower. We anticipate protecting and enhancing the resource.

This valuable soft-shell clam economic resource of the Commonwealth should not be further damaged by increased aircraft emissions near the clam flats.

WILDLIFE: The area between Governor's Island flats and the former Apple Island has become a thriving bird sanctuary, right off the end of the proposed R14 and the ocean flight path. TASL ("Take A Second Look") has been monitoring shore birds in this area for at least 15 years.

At least 20 kinds of birds other than the regular seagulls, cormorants, sandpipers and such habituate Governor's Island Flats. These include the increasingly endangered Black Duck, various plovers, Brant, and occasional Great Blue Heron. Most striking in both appearance and regular use of the habitat is the American Oystercatcher. 398.6

The area off the proposed Runway 14 is the only regular habitat of the American Oystercatcher in Boston Harbor, according to TASL records. Two have occasionally been spotted at Snake Island in the September and October bird censuses; one or two are occasionally spotted during perhaps one census only each year in the Harbor Islands. (For further information contact Maury Hall, 661 East Street, South Boston 02127 or Soheil Zendah, 42 Baker Ave, Lexington 02421.)

The brilliant long red-orange bill of the Oystercatcher is often seen among the Elizabeth Islands. Though not a birder, as a boating writer and cruising guide author, I'm always interested in birds that boaters might spot. A row of Oystercatchers at Governor's Islands Flats a few years back when I was helping provide water transportation to the TASL observers was a stunning sight. I've boated extensively in Boston Harbor for 30 years or so but had never seen anything like it – till the next year, and the next.

The reasons that were valid in defeating Runway 14/32 some 25 years ago are still valid, and more reasons have been added. Massport needs a comprehensive problem-solving approach based on solid research, not an outmoded and damaging 14/32 bandaid.

Sincerely yours,

Anita L. Martin

Code	Topic 1	Topic 2	Comment	Response
398.1	Purpose and Need	Delay	Delays are largely attributed by Massport to northwest winds which limit runway use, truly a specious argument. Even if northwest winds were responsible for the alleged delays, construction of [Runway 14/32] ... would be no use in takeoffs into a northwest wind.	Northwest wind conditions force the use of runway configurations with only one or two active runways. This reduces the capacity from the three-runway configurations otherwise available and results in increased delays.
398.2	Regional Transportation	Regional Airports	Surely it would be better to spread the traffic around the region so that the odds of all air transportation being severely affected by an earthquake would be sharply reduced.	Comment noted.
398.3	Noise	Impacts	...the frequency and vigor of side-line vibration have increased drastically in the last few years. ...What is this doing to the structure of the house?...	Low-frequency noise has tended to be more noticeable in recent years as higher frequency levels have been treated through new engine and nacelle technology. However, the levels are not normally high enough to cause structural damage.
398.4	Ground Transportation	Access to Logan	...the increased traffic will increase both air and water pollution....	The Preferred Alternative is not expected to lead to an increase in passenger demand, and therefore, it will have no effect on congestion or delays on Boston area highways. Refer to Section 4.2 of the Supplemental DEIS/FEIR. No alternatives violate the NAAQS. The Preferred Alternative shows better air quality results than the other alternatives.
398.5	Water Resources	Airport Operations	Possible impacts on shellfish: the clam flats around Logan Airport have been the most productive clam flats north of Boston for most the past 15 years, at least. ...	Neither runway nor taxiway construction will affect shellfish habitat surrounding the airport. Many of these shellfish areas have been reopened to Master Diggers over the past decade indicating that the airport is not adversely affecting these resources. The quality of airfield runoff will not be changed by the project as described in Section 6.6 of the Supplemental DEIS/FEIR.
398.6	Alternatives	Runway 14/32	...[Birds using] the area between Governor's Island flats and the former Apple Island [could be affected].... The area off the proposed Runway 14 is the only regular habitat of the American Oystercatcher in Boston Harbor,....	All construction will be confined to upland portions of the airfield. The closest construction to the tidal flats between Governors Island and the former Apple Island (Delta Taxiway extension) will be separated from the tidal flats by Runway 9/27. Stormwater runoff quality will be similar to current conditions and are not predicted to adversely affect the harbor environment. The American Oystercatcher has been observed at Logan Airport on an intertidal spit of land adjacent to the intersection of Runway 9/27 and Runway 15/33. Neither runway nor taxiway construction will affect this particular habitat.

LETTER 399

April 19, 1999

Arthur Pugsley
Associate Environmentalist
MEPA Unit
Executive Office of Environmental Affairs
100 Cambridge Street, 20th Floor
Boston, MA 02202

RE: Massachusetts Port Authority DEIS/R
Logan Airside Improvements Planning Project

Dear Mr. Pugsley:

After reviewing the Draft Environmental Impact Statement/Report submitted by the Massachusetts Port Authority, I would like address what appear to be some of the glaring errors, deficiencies or deliberate attempts to mislead which are found throughout the report.

First is the obvious omission of any discussion regarding an alternative which would attempt to absorb or divert any projected increase in passengers or operations, especially in light of Massports ownership of Hanscom Field, a facility which is underutilized, and recent agreement to take over operations at the Worcester facility. The diversion of operations to those facilities would also have environmental impacts which should be examined, but this report remains incomplete unless that alternative is given thorough discussion and explanation as a part of the report. 399.1

A second glaring deficiency in the report deals with Massport's grossly misleading discussion of the environmental impacts of the increased ground traffic which this project will generate. It is obvious that the purpose of this project is to increase operation capacity by over 150,000 operations and to increase passenger capacity by over 15 million passengers annually. To state that this increase will not generate additional ground traffic is a farce. 399.2

It is known, and the report itself states that approximately 90 percent of the traffic at logan is origin/destination in nature. Logan, unlike Atlanta or Chicago, is not a hub. This means that the vast bulk of this 15 million passenger increase will need ground access to and from the airport. The environmental impact of these vehicles sitting for hours in clogged entrance and exit roadways and entrances to the tunnels is a crucial part of this report, and without such an examination, this report is incomplete.

Massport attempts to justify its misleading handling of this crucial part of this report by making the erroneous assumption that the passenger increase and traffic increase will occur regardless. At best, this is sheer speculation which, without substantial data to support it, should have no part in an environmental impact statement. At worst, it is a deliberate attempt to skew the process to sell the project.

Further notable deficiencies in the report are:

a. The use of a flawed model in figuring the 65 dB contours; 399.3

b. The segmentation of airside improvement impacts and groundside improvement impacts in violation of MEPA regulations under 310 CMR; 399.4

c. The use of five year old data as a baseline; 399.5

d. The overstatement of the benefits of converting to stage 3 aircraft when over 85% of the fleet is already stage 3 and all nighttime operations are stage 3; 399.6

e. The overstatement of the benefits of the soundproofing program as adequate mitigation and the deficiencies in the current scope of that program; 399.7

f. The failure to discuss and examine the negative impacts which the increased operations the project will generate will have with regards to noise and air quality; 399.8

g. The total inadequacy of the program proposed to protect the endangered species which the project will effectively wipe out; 399.9

h. The false information that Logan operates at a maximun capacity of 120 operations per hour when in actuality, investigation will show that operations are as high as 150 or more per hour in the three runway configuration. 399.10

i. Failure to discuss the increase in noise and pollutants which will be caused by the dramatic increase in operations when there are East/Southeasterly winds blowing directly towards the residential communities. 399.11

j. The miscalculation of the actual current hours of delay time along with the omission of the fact that delay time over the past five years has actually improved; and 399.12

k. Failure to point out that, even by Massport's own admission, the project's perceived net benefits will be nil within a few years after completion of construction and will only lead to the need for further action. 399.13

In short, this report is filled with erroneous calculations, misleading information and omissions, and should be rejected. It is a factually skewed sales pitch for a project which will have little benefit as a true solution to the air transportation problem facing the region and enormous negative environmental impact on the numerous communities already bearing the lion's share of the burdens created by an air transporation system which offers substantial benefits to communities well outside the Metropolitan Boston area.

Very truly yours,

Thomas J. McCarthy

Code	Topic 1	Topic 2	Comment	Response
399.1	Regional Transportation	Regional Airports	...omission of any discussion regarding an alternative which would attempt to absorb or divert any projected increase in passengers or operations, especially in light of Massport's ownership of Hanscom Field, a facility which is underutilized, and recent agreement to take over operations at the Worcester facility. ...	The regional alternatives were explicitly considered in the delay reduction and environmental analyses by studying a range of future demand and activity levels. Passenger levels analyzed cover a range from 29M passengers to 45M passengers. Similarly, 510,000 to 656,000 future aircraft operation levels were analyzed. The use of variable long-term passenger and operations forecasts allow for uncertainty relating to the rate of future economic growth, the development of high-speed rail alternatives, the acceptance and usage of video-conferencing, and the role of regional airports. The delay reduction analyses indicate that the proposed airside improvements, as well as the regional alternatives, are necessary for accommodating current and future levels of demand.
399.2	Ground Transportation	Access to Logan	...grossly misleading discussion of the environmental impacts of the increased ground traffic which this project will generate. ... .The environmental impact of ...vehicles sitting for hours in clogged entrance and exit roadways and entrances to the tunnels is a crucial part of this report, and without such an examination, this report is incomplete.	The Preferred Alternative is not expected to lead to an increase in passenger demand, and therefore, it will have no effect on congestion or delays on Boston area highways. Refer to Section 4.2 of the Supplemental DEIS/FEIR.
399.3	Noise	Model	The use of a flawed model in figuring the 65 dB contours;	Massport and the FAA disagree.
399.4	Environmental Process	MEPA	The segmentation of airside improvement impacts and groundside improvement impacts in violation of MEPA regulations under 310 CMR;	The Secretary of Environmental Affairs found that "...the Draft Environmental Impact Report (DEIR) submitted on this project adequately and properly complies with the Massachusetts Environmental Policy Act...". Refer to the Certificate of the Secretary of Environmental Affairs on the DEIR, dated May 7, 1999.
399.5	Delay	Model	The use of five-year-old data as a baseline;	The projections of future airfield delays at Logan Airport are not based on analysis and modeling of delays which occurred during 1993. The analysis for 1993 was included in the Airside Project Draft EIS/EIR to provide historical perspective to the delay problem at Logan Airport and for use in model calibration. The analysis contained in the Supplemental DEIS/FEIR has been updated to include modeled delay results for 1998 to provide more current context to airfield conditions at Logan Airport. Refer to Section 4.2 of the Supplemental DEIS/FEIR for a description of the delay analysis and discussion of current and future delays at Logan Airport.

Code	Topic 1	Topic 2	Comment	Response
399.6	Noise	Hushkitted Aircraft	The overstatement of the benefits of converting to stage 3 aircraft when over 85% of the fleet is already stage 3 and all nighttime operations are stage 3;	The study does not overstate the benefit of further conversion to Stage 3 aircraft on future noise levels. It uses two fleet scenarios in which almost all aircraft meet Stage 3 requirements, either as hushkitted Stage 2 aircraft or new Stage 3 aircraft, and three fleet scenarios in which all the aircraft meet Stage 3 requirements. Most of the aircraft are new high-bypass, engine-powered Stage 3 aircraft. Many of the hushkitted aircraft have been retired.
399.7	Noise	Sound Insulation	The overstatement of the benefits of the soundproofing program...	Logan Airport has one of the most comprehensive and progressive sound insulation programs of any airport in the country. It was initiated in 1980 before any airport began receiving federal funding to soundproof homes under FAR Part 150. It is the only program in the country to offer residents extra sound insulation treatment in a "room of preference" chosen by the homeowner and it is the only program in the country attempting to receive FAA approval to expand the area of eligibility by accounting for hill effects. In addition, as of the 1999–2000 construction season, FAA grants covering 80 percent of the cost of sound insulation (paid for by airline ticket taxes), combined with funds provided by Massport through Passenger Facility Charges and landing fees, had fully funded the sound insulation of all eligible dwelling units in Massport's current sound insulation program. Despite this accomplishment, Massport continues to seek means of expanding its sound insulation program exclusive of FAA's decision on this Supplemental DEIS/FEIR. If the FAA approves the Preferred Alternative, Massport is committed to expanding the program to include all additionally eligible residences.

Code	Topic 1	Topic 2	Comment	Response
399.8	Alternatives	Runway 14/32	The failure to discuss and examine the negative impacts which the increased operations the project will generate will have with regards to noise and air quality;	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR analyze the environmental impacts of the Airside Project, consistent with established federal and state scoping directives. Appropriate mitigation associated with the Airside Project has also been established. Massport has programs in place to reduce the environmental impacts associated with Logan Airport as a whole. These initiatives are described in the *Logan Airport ESPR* and its updates.
399.9	Alternatives	Runway 14/32	...inadequacy of the program proposed to protect the endangered species...	Massport has developed a comprehensive on-site and off-site Upland Sandpiper habitat mitigation plan in close coordination with the Massachusetts Natural Heritage and Endangered Species Program (NHESP) for loss of such habitat at Logan Airport from construction of the Centerfield Taxiway. The plan strives to enhance protection of remaining Upland Sandpiper habitat at Logan Airport without increasing the aviation safety hazards typically associated with birds or hazards to the birds. Additionally, it is expected that an area of former Upland Sandpiper habitat at Camp Edwards on Cape Cod will be restored to grassland habitat by removing woody and shrub vegetation to encourage enhancement of the Upland Sandpiper regional population. This restoration effort provides a unique opportunity to expand grasslands in the Commonwealth far exceeding the ±40 acres to be lost at Logan Airport. In the event that such a program at Camp Edwards is not available, an appropriate alternative program acceptable to the NHESP will be developed and implemented. Additional details of the Upland Sandpiper mitigation plan are presented in Section 6.5 of the Supplemental DEIS/FEIR.
399.10	Purpose and Need	Airfield Capacity	The false information that Logan operates at a maximum capacity of 120 operations per hour when, in actuality, investigation will show that operations are as high as 150 or more per hour in the three runway configuration.	Airport capacity depends on fleet mix, weather conditions, runway assignments and other factors. The normal capacity configuration at Logan Airport uses Runway 4L, Runway 4R, and Runway 9 under VFR weather conditions and can handle 120 operations per hour. For short periods, the flow may be greater or less than this rate, but the sustainable capacity does not exceed 120 operations per hour.

Code	Topic 1	Topic 2	Comment	Response
399.11	Alternatives	Runway 14/32	[The report fails to discuss the]...increase in noise and pollutants which will be caused by the dramatic increase in operations when there are east/southeasterly winds blowing directly towards the residential communities.	While equivalent jet operations increase by more than 50 percent from a 1993 base to the future 37.5M High Fleet scenario if the Preferred Alternative is implemented, the appropriate basis for comparison of the Preferred Alternative is the No Action Alternative. Equivalent jet operations would increase by more than 75 percent over the Preferred Alternative if no action were taken. Despite the increase in equivalent jet operations, the Airside analysis indicates that overall noise impacts decline over time with the elimination of Stage 2 aircraft and the replacement of hushkitted Stage 3 aircraft with non-hushkitted Stage 3 aircraft. By allowing aircraft operations to shift from over-land to over-water routings and by providing greater flexibility in the use of Runways 27 and 33L for takeoff, the Preferred Alternative further reduces the highest noise impacts to the close-in neighboring communities. Furthermore, the Supplemental DEIS/FEIR also demonstrates the more equitable balance of noise impacts among communities surrounding Logan Airport that can be achieved with the Preferred Alternative as opposed to the imbalance that occurs today and would occur in the future if no action is taken. The planned improvements to Logan Airport will help reduce air emissions from the airport. The air quality model, which includes actual weather data and wind conditions experienced at Logan Airport, shows pollutant concentrations west-northwest of the airport to be well within the NAAQS. No alternatives violate the NAAQS. The Preferred Alternative shows better air quality results than the other alternatives. Massport is separately studying measures for reducing Logan Airport's contribution to air emissions in the region, in the *Logan Airport 1999 ESPR* (previously GEIR). Consideration is given to all emissions sources, and analysis is conducted for the airport, East Boston and regional study areas.
399.12	Delay	Model	The miscalculation of the actual current hours of delay time...	Refer to Section 4.4 of the Supplemental DEIS/FEIR for a discussion on the estimation and modeling of flight delays. It includes a description of FAA and U.S. DOT delay measures and their limitations, an explanation of computer models for estimating flight delays, and historical data on delays at Logan Airport and other major United States airports. The methodology used for the Airside Project includes the effects of constraints at Logan Airport, and produces lower delay estimates than FAA modeling. The FAA approved all the models, which have been validated in previously published studies of Logan Airport.
399.13	Purpose and Need	Airfield Capacity	...the project's perceived net benefits will be nil within a few years after completion of construction...	Based on simulation modeling, Logan Airport experienced 120,000 hours of runway-related delays in 1998. If no actions are taken, runway-related delays are forecast to grow as high as 333,000 hours under a 37.5M High Fleet scenario. The Preferred Alternative produces immediate and long-term benefits by lowering runway delays by 38,000 hours if it had been in place in 1998, and by as much as 94,000 hours in the future 37.5M High Fleet scenario. Because of the impact of the regional alternatives, the 37.5M High Fleet scenario is not expected to be achieved until 2015. The sooner airside efficiencies are implemented; the more benefits will accrue over time. Section 4.6 of the Supplemental DEIS/FEIR shows that delay reduction benefits increase over time as traffic levels increase.

LETTER 400

Mr. Arthur Pugsley
Review Officer
MEPA
RE EOEA 10458 Logan International Airport

Mr. Pugsley:

I am sending this short email to register my opposition to a MEPA approval of the Massachusetts Port Authority's plan and supporting Environmental Impact Report for a runway, entitled 14/32, and a central taxiway at Logan International Airport.

First, it must be said this proposal to build yet another runway at Logan International Airport is highly suspicious. The very design of this proposed runway as laid out in the EIR appears to show that Logan has reached its it for flight capacity. The theoretical figure of 120 operations per hour at the outside limit even with absolutely no wind. Without filling tidelands and expanding the Logan landmass into Boston Harbor waterways the current airport is as good as it gets.

I am as yet unable to understand exactly what Massport means when it refers to Runway 14/32 as a unidirectional, over-the-water facility. It seems self-evident that a runway as short as 14/32 is planned to be can be used only for aircraft operations in one direction at a time. The problem lies with the term 'over-the-water'. 400.1

Massport's EIR is less than clear in explaining this, likely due to the writers' afflicted view that laymen care to understand their jargon. If this runway is to be used solely for over the water landings and takeoffs, it is de facto evidence that Logan Airport's footprint is virtually full except for this small piece of nearly harborside land. In other words, building development west of the wished-for 14/32 precludes its full use as a runway.

I live on Grandview Avenue in Winthrop and have a front door that is as severely impacted as aircraft by northwest winds since my house faces Logn Airport across a narrow waterway and the sweep of the airport. Although without meteorological measurements, I can say with a great deal of certainty that it is not northwest winds of great magnitude that cause delays in the numbers that Massport claims. If a plane destined for Logan is held up by San Francisco clouds the delay will be counted at Logan. 400.2

Finally, Massport EIR noise impact estimates on the town of Winthrop are jocular. Using 75db as a high standard is too often a serious underestimate of what actually occurs when certain types of aircraft fly over the Point

Shirley section of the town. Even with the windows Massport supplied some years ago, some older, apparently Stage 2 planes easily drown out a television set tuned to a moderate sound output or cause a roar in the ear of a person at a distant telephone. It seems likely that real world sound levels of 85-95db are more the case when winds are off the sea as they often are during warm weather months. A permanent Massport noise monitor at the corners of Grandview and Bayview avenues should certainly record these higher levels. 400.3

Even though Masport claims its Runway 14/32 will switch aircraft operations away from Winthrop, some of what it says on p. 6-10 seems open to severe questioning. It talks about jet aircraft takeoffs from Runway 14, another example of the confusion over use of this proposed facility. If the over-the-water function is held to, this means these jets would be taking off into a south-southeast wind. Since the wind is perhaps most seldom out of this direction, it seems to this layman that the use of 14/32 for takeoff purposes is almost negligible. 400.4

In short, the EIR is confusing, laden with poorly designed standards upon which to base judgements of "information" contained in the EIR, and thus is saturated with misinformation. The decibel levels above are but one example.

The reducing of approach minimums, as convenient as those may be for airlines, seems a particularly bad safety risk. While the ILS may have given an upgrade to Logan for some flight operations on Runways 15/33, to reduce approach minimums on other runways is merely another flouting of public safety for the convenience of passengers and airlines. The safety of communities surrounding Logan is far more important than the convenience of airlines that may expens a few more bucks on fuel and passengers whose relatives may have to wait a few more minutes for their arrival.

Sincerely,

Thomas A. McNiff, Jr.

400.1	Purpose and Need	Airfield Capacity	....EIR appears to show that Logan has reached its limit for flight capacity. ... .If ...runway [14/32] is to be used solely for over the water landings and takeoffs, it is de facto evidence that Logan Airport's footprint is virtually full ...building development west of ...14/32 precludes its full use as a runway.	Massport is separately studying measures for reducing Logan Airport's contribution to air emissions in the region, in the *Logan Airport 1999 ESPR* (previously GEIR). Consideration is given to all emissions sources, and analysis is conducted for the airport, East Boston and regional study areas. The Runway 14/32 concept under review in the Supplemental DEIS/FEIR allows unidirectional operations only (*i.e.*, all aircraft arrivals would occur over Boston Harbor to the Runway 32 approach and all departures would initiate from the Runway 14 heading out over Boston Harbor). State approval under MEPA and federal approval under NEPA will allow Runway 14/32 to proceed only on a basis consistent with the stated unidirectional limitations. Consistent with any such approvals, Massport will light and stripe Runway 14/32 to accommodate unidirectional operations only. Furthermore, the location of proposed Runway 14/32 involves physical limitations that reinforce the unidirectional requirements of that improvement concept. The Hyatt Hotel and Conference Center, which is 174 feet high, is within 1,300 feet of the Runway 14. The location of the Hyatt Hotel and Conference Center invades applicable FAA approach surface glide slope requirements, thereby precluding arrivals from the west to the Runway 14. Another factor limiting westerly operations on Runway 14/32 is the lack of available facilities to allow aircraft to taxi to the Runway 32. The unidirectional limitations of Runway 14/32 allow maximum use of over-water operations and thereby limit operational impacts over residential areas. To strictly reinforce these important environmental benefits, Massport has designated the intended unidirectional limitation on Runway 14/32 as a mitigation measure. Refer to Section 8.7 of the Supplemental DEIS/FEIR Draft Section 61 Findings, and the discussion in Section 8.5 of the Supplemental DEIS/FEIR regarding enforcement of unidirectionality of Runway 14/32.
400.2	Purpose and Need	Delay	I live on Grandview Avenue in Winthrop and have a front door that is as severely impacted as aircraft by northwest winds since my house faces Logan Airport across a narrow waterway and the sweep of the airport. Although without meteorological measurements, I can say with a great deal of certainty that it is not northwest winds of great magnitude that cause delays in the numbers that Massport claims. If a plane destined for Logan is held up by San Francisco clouds the delay will be counted at Logan.	The Airside Project addresses delays from constraints at Logan Airport. Section 1.4 and Appendix C of the Supplemental DEIS/FEIR also contains a detailed discussion of the FAA and U.S. DOT delay measures and historical data, along with comparisons of Logan Airport delays within the context of delays at other United States airports.

Code	Topic 1	Topic 2	Comment	Response
400.3	Noise	Impacts	...noise impact estimates on the town of Winthrop are [understated]. ....sound levels of 85-95 dB are more the case when winds are off the sea... A permanent Massport noise monitor at the corners of Grandview and Bayview avenues should certainly record these higher levels.	Differences between measured and modeled sound levels have been reported in Logan Airport's various GEIRs and Annual Updates for a number of years. Differences at close-in locations were significantly reduced in 1996 through modification of source levels to better account for over-water sound propagation and apparent use of higher engine power settings than are normally assumed in the noise model's database (Refer to Appendix F of the *Logan Airport 1996 Annual Update).* In 1998, differences between measured and modeled noise became even less when Massport upgraded its monitoring system and began to report noise caused only by aircraft -- a metric directly comparable to the DNL exposure levels predicted by the noise model. At sites having exposure levels of 60 dB or more, this improvement to the monitoring system brought measured and modeled DNL values to within 0.2 dB of each other. (Refer to Chapter 6 of the *Logan Airport 1999 ESPR* (previously GEIR)). Massport continues to investigate possible causes for remaining differences (such as from hill effects) and continues to pursue FAA approval of noise model adjustments that would permit expansion of its sound insulation program to include the effects of terrain. Massport also expects to extend eligibility lines to include boundaries that follow local streets rather than strict noise contour lines. Nevertheless, Massport continues to believe that the FAA's INM noise model used in the Airside Project noise analyses accurately represents expected noise exposure. To the extent that federal regulations permit and that funding is available, the proposed sound insulation program will include: (i) not only all residences that fall within the Preferred Alternative's 65 dB Day-Night Sound Level contour when compared to the Airside Project's No Action Alternative's 65 dB Day-Night Sound Level contour, but also (ii) Massport and the FAA will continue to sound insulate and work to complete the current 2-year sound insulation program as presented in the *Logan Airport 1999 ESPR.* For the eligible residences, the FAA will fund building code upgrades, to the extent necessary, to implement sound insulation improvements.
400.4	Alternatives	Runway 14/32	...Massport ...talks about jet aircraft takeoffs from Runway 14,... If the over-the-water function is held, too, this means these jets would be taking off into a south-southeast wind. Since the wind is perhaps most seldom out of this direction, it seems ...the use of 14/32 for takeoff purposes is almost negligible.	The use of Runway 14 for departures will most often occur during weather conditions that favor the use of Runway 15R. It is true that these conditions do not occur frequently, and as a result, Runway 14 is not expected to be used extensively for departures. The modeled use never exceeds 2.3 percent of equivalent departures under any future scenario. Most of the delay reduction benefits of Runway 14/32 are associated with arrivals to Runway 32 under northwest wind conditions.

LETTER 401

Winthrop

Dear [illegible]

I can't believe Mass Port got the go ahead for a runway. Have you ever visited Winthrop unannounced? We have not received fair consideration from you. 401.1

The noise is horrendous and it grows day and nite

Please! for all our sakes.

Code	Topic 1	Topic 2	Comment	Response
401.1	Noise	Impacts	The noise is horrendous and it goes on day and night.	In 1998, 77 percent of Logan Airport's jet traffic affected communities to the north and south of the airport—East Boston, Winthrop, Revere, parts of South Boston, Dorchester, Quincy, Milton, and Braintree. Without Runway 14/32, as much as 88 percent of Logan Airport's aircraft operations will overfly these communities when Logan Airport reaches 37.5 million passengers. Construction of Runway 14/32 will allow a more balanced geographic distribution of aircraft operations over populated areas, will increase the number of over-water operations, and will reduce noise exposure for close-in communities. In fact, the most heavily impacted communities will experience a decrease in overflights compared to 1998 levels. With the Preferred Alternative, when Logan Airport reaches 29 million passengers, overflights from Runway 4 arrivals and Runway 22 departures, which affect South Boston, Quincy, Milton, and Braintree, will decrease from 107,861 in 1998 to 58,305 operations. Similarly, overflights affecting Winthrop (Runway 27 arrivals and Runway 9 departures) will decline from 88,224 in 1998 to 55,805 in approximately 2015.

LETTER 402

Alicia A. Stoddard

Winthrop, MA 02152

Secretary of Environmental Affairs
Attn: MEPA Office
Mr. Robert Pugsley – EOEA #10408
100 Cambridge St. 20th Floor
Boston, MA 02205

April 19, 1999

Dear Mr. Pugsley:

I am writing to express my opposition to the Logan Airport expansion proposal put forth by Massport, which includes new runway 14/32 as well as a new center taxiway. I have several strong concerns with Massport's presentations and with the Environmental Impact Study/Report (EIR/EIS) that has been prepared for this project:

- **There have been NO alternatives to runway 14/32 provided.** This is unacceptable. There are numerous airfields in the Boston area that would be capable of handling an increase in traffic. In particular, Hanscom Field and Pease Field have not been mentioned as alternative sites at any point in the proceedings. 402.1

- It has been mentioned that **consideration for a second major airport in the Boston area has been terminated** because travellers and business people do not want to have to continue travel once they've completed the fight portion of their trips. Personally speaking as a well-travelled tourist and business person, I find this preposterous. There are many, many airports for major cities located well outside their metro area. Accommodations are made by all parties involved (via buses, trams, trains, etc.), and hardly any notice is taken of the additional travel time. It is just a fact of travel.

- Another alternative that has been downplayed deals not with air travel but with **train travel.** The new, high speed trains are being introduced in the near future. Could this not be an answer to alleviate some of Logan's congestion? The trains have not received any inclusion as part of the solution to this problem. 402.2

- **No Long-term figures as to number of flights over cities and towns have been provided.** The only figures that have been released are five year estimates. Again, this is unacceptable. Apparently, Massport is attempting to effect a permanent change affecting hundreds of thousands of citizens using data that looks ahead only five years. How can a reasonable assessment of future environmental impact be determined using these figures? I find this rationalization seriously flawed, and a heinous mismanagement of resources. Any other business venture would need to have long range plans in effect in order to succeed and have the confidence of its customers behind it. 402.3

- **The EIR/EIS is obsolete; it is dated 1995.** Each year, the flights into and out of Logan have increased, as has the noise and pollution generated at the airport. Figures from this report are no longer valid. In fact, many of the studies used in preparing the report were outdated at the time of the report. In particular, I noted that the delay study utilized was from 1993, which by "coincidence" was the year with the highest delays recorded. This does not accurately reflect the scenario at Logan. Further, the delays stated have not been dissected to ascertain which are directly the result of non-use of runways alone. Delays caused by such circumstances as pilot sickness, maintenance necessities, and snow delays that eventually cause cancellation of flights have not to be removed from the equation, causing an inflation of the issue. Therefore, four years later, the report is even more inaccurate and should be redone. 402.4

- Finally, I do not believe that **adequate consideration of the quality of life impacts** to the citizens of the many cities and towns affected by this decision has been made. I have been a resident of Winthrop for nearly three years, and have lived in several different locations within the town. I have been continuously awakened out of sleep because of airplane noise in each of the locations that I have lived. Currently I do not live under a flight path, but even this does not alleviate all of the noise. I believe that the new runway will result in an <u>increase</u> of traffic in the future, not simply decrease delays, as Massport claims. In many other cities and towns the problem is much worse. I believe a more *adequate and accurate* Environmental Impact Study is needed, and I believe that alternatives to a new runway and taxiway need to be seriously considered in order to assuage the "delay" problem at Logan Airport. The runway will result in increased air, water, and noise pollution and decreased quality of life for citizens in the surrounding environs. 402.5

  In closing, I would like to reiterate my opposition to the new runway and taxiway and my support of a new, adequate EIR being undertaken.

Sincerely,

Alicia A. Stoddard

Code	Topic 1	Topic 2	Comment	Response
402.1	Regional Transportation	Regional Airports	....unacceptable. There are numerous airfields in the Boston area that would be capable of handling an increase in traffic. ...	Chapter 2 of the Supplemental DEIS/FEIR provides a discussion of the specific role played by the regional transportation alternatives and steps that Massport has taken to foster use of these alternatives. Massport has long recognized and has been a proponent of options to Logan Airport. Together with the regional airports, Massport has implemented a regional strategy to enhance the use of options to Logan Airport. In the Airside Project Draft EIS/EIR, Massport identified up to 7.3 million annual passengers that could be absorbed by regional alternatives that include use of T.F. Green/Providence, Manchester and Worcester Regional airports, as well as the new high-speed rail to New York. In the Supplemental DEIS/FEIR, Massport recognizes that these developments will slow Logan Airport's passenger traffic growth. Logan Airport may not achieve the 37.5 million passenger forecasts until after 2010, but rather closer to 2015, and the 45 million passenger forecasts may not be achieved until after 2020. While regional alternatives can play an important role in reducing the rate of future traffic growth at Logan Airport, they do not address Logan Airport's inability to efficiently accommodate current levels of demand during northwest wind conditions. Runway 14/32, which is designed to correct the problem with Logan Airport's layout, is necessary to correct this deficiency and provides clear benefits at current aircraft traffic levels. These benefits will only increase in the future, even as developments at the regional airports act to reduce the rate of future growth at Logan Airport.
402.2	Regional Transportation	Passenger Rail	....Could this [trains] not be an answer to alleviate some of Logan's congestion. The trains have not received any inclusion as part of the solution to this problem.	Over the last ten years, various agencies and transportation planning organizations have conducted a number of studies that address regional transportation issues. These studies form the basis of a comprehensive regional transportation strategy that includes the Airside Project at Logan Airport, expansion and growth of the regional airports, and the implementation of high-speed rail and other regional rail projects. All these measures are necessary for meeting the short-term and long-term inter-city travel needs of the New England region. These regional recommendations are in various stages of implementation. By the end of 2000, Boston residents had several alternatives to Logan Airport including Worcester Regional Airport, Manchester Airport, T.F. Green/Providence Airport, Pease International Tradeport, and Amtrak's high-speed Acela train service. Refer to Chapter 2 of the Supplemental DEIS/FEIR for a complete discussion of options to Logan Airport.
402.3	Analysis Assumptions/ Methodologies	Planning Period	No long-term figures as to number of flights over cities and towns have been provided. ...	The air quality analysis includes all existing sources and future growth at Logan Airport.

W:\MAD\LOGAN\Data\Reports\Recirculation Comments and Responses\Private Citizens.doc

Code	Topic 1	Topic 2	Comment	Response
402.4	Delay	Model	...the delays stated have not been dissected to ascertain which are directly the result of non-use of runways alone. Delays caused by such circumstances as pilot sickness, maintenance necessities, and snow delays that eventually cause cancellation of flights have not be removed from the equation, causing an inflation of the issue. ...	The Airside Project addresses delays from constraints at Logan Airport. Section 1.4 and Appendix C of the Supplemental DEIS/FEIR also contains a detailed discussion of the FAA and U.S. DOT delay measures and historical data, along with comparisons of Logan Airport delays within the context of delays at other United States airports.
402.5	Delays	Impacts	...the new runway will result in an increase of [air] traffic in the future, not simply decrease delays...	The Preferred Alternative, and specifically unidirectional Runway 14/32, would not increase Logan Airport's normal airfield capacity of approximately 120 operations per hour. This capacity is available at Logan Airport approximately 80 percent of the time. Runway 14/32 would allow Logan Airport to maintain this capacity during periods of strong northwest winds that now require controllers to operate on only one or two runways, compared to the typical three-runway configurations used at Logan Airport. The runway will not increase Logan Airport's normal operating capacity, nor will it encourage or induce an increase in aircraft operations.

LETTER 403

Ron Wayland

MEPA Hearing Testimony

My name is Ron Wayland. I am a resident homeowner in the Town of Winthrop. My home is located in a section of the town, which receives the maximum impact of noise and emissions. I am therefore one of those who has received what is known as " mitigation windows" from MassPort. I am also a businessman and an attorney who is interested in the economic and environmental well being of this Commonwealth.

I am here at this MassPort Hearing (pardon the oxymoron) to testify that the people of Winthrop and those who live in the communities adjacent to Logan Airport have reached, indeed have exceeded their limits of toleration as far as MassPort Expansion is concerned. MassPort may not admit to you that Logan Airport is at capacity but I am here to tell you that we are beyond capacity. The rallies, the resolutions, the writings and recitations you see and hear are the harbingers of a response not seen in these parts for many years should MassPort not come to its senses.

I mention the "mitigation windows" because I want you to know that we consider those windows as nothing more than preemptive damages for taking our outside away and for making us prisoners in our own homes. The level of our discontent should not be a surprise to you or to MassPort. My sentiments are reflected in the unanimous resolutions of the governing bodies in the cities and towns surrounding Logan. It is clearly stated by the CAC, the body whose reason for being is MassPort and Logan Airport. However, if for some reason you have not had your ear to the ground, we would be pleased to provide this Committee with a gavel to gavel videotape of the Joint Committee on Transportation

Hearing on this issue. We would be pleased to present you with a video tape record of the rally which was held on the State House steps. In addition to the recorded testimony, we would respectfully ask you to listen to the embarrassed silence of the business community on the quality of life issues surrounding this proposal.

This hearing is to consider environmental concerns.

The instruments we use are our own bodies and the standard by which we judge these things is our own health, the health of our neighbors and the quality of our lives. MassPort uses strategically placed gadgets, mechanical and electrical devises. Their standard is not the quality of life. It seems to be more aptly stated in the question "Will it kill them?"

We can tell you with certainty that the noise is not just an annoyance. It is making us irritable and ill. It takes away our sleep. It causes us to be tired. It produces stress. We can tell you that the aircraft emissions are visible in the sky, on our windows and automobiles. We can smell it and taste it. But will it kill us? 403.1 403.2

I cannot answer that question yet. I would suggest that MassPort, the airline industry and every other airport authority is making sure that they are not put in a position where they can answer that question either. The stakes are just too high especially for urban airports. When MassPort initiated their community meetings to sell 14/32 and the center strip taxiway they started in Winthrop. During their presentation and in response to a question one of the MassPort representatives revealed that the Harvard School of Public Health was conducting a health study relative to respiratory illnesses around Logan Airport. We could not

believe it when they said that Winthrop was not going to be part of that study. In an attempt to cover up this slip, Peter Blute offered to pay for Winthrop's inclusion in the study. We are still waiting for that study to come to Winthrop. I believe our Community Access Channel still has that meeting on tape and we would be pleased to make it part of the record. MassPort made earlier promises relative to health studies. I believe we have these broken promises on tape as well. We would be happy to make that part of the record too.

Mr. Chairman, our instruments (our bodies) and our standards (our health and the quality of our lives) tell us that we have a serious, very serious environmental problem which no American should have to endure and which we will not endure. I will say that again. We will not endure. We call on you to do your duty and stop expansion at Logan Airport by rejecting the findings contained in their environmental report or at least by demanding the studies they don't want to take.

We are anxious to move forward with the Governor, with Mayor Menino and with MassPort to find answers to our air transportation problems. There are better ways, ways that will economically benefit the Commonwealth of Massachusetts and improve the health and quality of life for those who live in our most populous cities and towns. A quick rejection of this proposal will release the energy and resources of our government to seek and implement these better ways.

Thank you.

Ron Wayland

A Long Term
Massachusetts Air Transportation Plan

Step 1.

We must stop MassPort's Runway Expansion Plan.
(a.) If MassPort succeeds we will defer the real long-term solutions and consequently eliminate many of the options available to us today.
(b.) There are better short-term solutions that are transitional to the long-term answers.
(c.) The twenty five to thirty million dollars available for the MassPort expansion can be used to transition to an ultimate answer.

Step 2.

(a.) Regional airports are a short-term solution. Some freight can be moved to New Bedford, Worcester and Hanscom Field. Seasonal small aircraft (Cape Air) can immediately go to Hanscom. This makes sense because the annoyance to Logan's neighbors is greatest during the summer months. Shuttle service, to New York and Washington at Hanscom, would be immediately successful. 403.3
(b.) The twenty five million dollars should be used to build an Airrail Terminal at the intersection of the MassPike and Route 495 with dedicated high-speed rail to and from South Station connecting to Logan. Trains would leave the terminal every fifteen minutes and take fifteen minutes to get to either terminal. 403.4
(c.)At the MassPike/495 Airrail Terminal there should be a connector to Worcester Airport. This would take care of the inconvenience of getting to Worcester Airport. 403.5

A system like this is already in service at Heathrow Airport. Please use the Internet to see www.heathrowexpress.co.uk. Please note, in England this system will cut automobile traffic to the airport to 50%. It would keep air travel revenue in the Commonwealth of Massachusetts.

Step 3.

A new International Airport must be built, probably in the area of Fort Devens. The Airrail terminal at the MassPike/495 would be the ticket terminal and Fort Devens would be the Departure Terminal. They would be connected by high-speed rail as at Heathrow. High Speed trains would leave the ticket terminal ever fifteen minutes and would take no more that fifteen minutes to get to the departure terminal. 403.6

May I respectfully suggest that this proposal is worthy of study. There are presently sixty airports in the world using airrail as their answer. Another one hundred and twenty is in the planning or construction stages. This is what a 21st Century air transportation systems are going to be all about. I believe that this is the answer and I think this is the time to apply this answer to our air transportation system. I hope you will agree.

Miscellaneous Items

Letter 403

Code	Topic 1	Topic 2	Comment	Response
403.1	Noise	Impacts	...the noise is not just an annoyance. It is making us irritable and ill. It takes away our sleep. It causes us to be tired. It produces stress.	The Night Equivalent Sound Level (LeqN) was calculated at 23 selected locations for all fleets and scenarios. Tables 6.2.15 and 6.2.16 of the Supplemental DEIS/FEIR report these data for the 29M Low and 37.5M High Fleet scenarios of the Supplemental DEIS/FEIR. The results show that, at most locations, the LeqN for the future fleets is lower than for the 1993 case. Where there is an increase in LeqN, the reason was the increase in flights for the No Action Alternative, which generally was mitigated by the Preferred Alternative. These results indicate that there will be less sleep disturbance in the future than that currently experienced. Refer to Section 7.4 of the Supplemental DEIS/FEIR for a discussion of cumulative noise impacts.
403.2	Air Quality	Impacts	...the aircraft emissions are visible in the sky, on our windows and automobiles. We can smell it and taste it. ...	Monitoring of airborne soot levels in the vicinity of Logan Airport has shown that the airport is a very small (less than one percent) contributor. The air quality analysis, based on EPA/MDEP models and guidelines, performed for the Supplemental DEIS/FEIR is considered to be comprehensive and state-of-the-art.

Code	Topic 1	Topic 2	Comment	Response
403.3	Regional Transportation	Regional Airports	Regional airports are a short-term solution. Some freight can be moved to New Bedford, Worcester and Hanscom Field. Seasonal small aircraft (Cape Air) can immediately go to Hanscom. This makes sense because the annoyance to Logan's neighbors is greatest during the summer months. Shuttle service, to New York and Washington at Hanscom, would be immediately successful.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR specifically considered the role of Hanscom Field in the analysis of regional alternatives. Hanscom Field, which serves as a general aviation reliever airport to Logan Airport, already accommodates a significant number of aircraft operations (183,000 operations in 1998). The Hanscom Field activity includes private, business, charter, and air taxi operations that might otherwise use Logan Airport. Since the Airside Project Draft EIS/EIR was filed, Shuttle America, a newly founded airline, began commercial scheduled operations at Hanscom Field, offering limited turboprop services to short-haul regional markets – Trenton, Buffalo, Hartford (discontinued), Wilmington, Delaware (discontinued), and Greensboro. Shuttle America is also conducting operations between Hanscom and New York LaGuardia Airport. While Massport supports commercial service at Hanscom Field consistent with its established policy (60-seat regulation), it believes that Hanscom Field will maintain its role as a major general aviation reliever, and that its geographic proximity to Logan, Worcester Regional and Manchester airports will prevent its development as a significant commercial airport. Additionally, commuter airlines serving Logan Airport are unlikely to move a significant number of flights from Logan Airport to Hanscom Field, since approximately 50 percent of passengers on Logan Airport's commuter flights connect to other Logan Airport flights. However, any new commercial service initiatives proposed for Hanscom Field shall be reviewed for consistency with the *Hanscom GEIR* (HGEIR), its Annual Updates, and applicable regulatory limitations, and shall be considered by the Hanscom Field Advisory Committee. Refer to Section 2.6 of the Supplemental DEIS/FEIR for a discussion of Hanscom Field. The environmental impacts of commercial services at Hanscom Field are summarized from the HGEIR and appear in Appendix B of the Supplemental DEIS/FEIR. The Secretary of Environmental Affairs found that "...the Draft Environmental Impact Report (DEIR) submitted on this project adequately and properly complies with the Massachusetts Environmental Policy Act..." Refer to the Certificate of the Secretary of Environmental Affairs on the DEIR, dated May 7, 1999. The potential diversion of cargo operations was not specifically analyzed because cargo operations account for only two percent of aircraft activity at Logan Airport and since most all-cargo aircraft operate during off-peak hours, cargo operations do not contribute to delays at Logan Airport. However, all cargo operations were included in the future fleets analyzed in the Airside Project. Additionally, some cargo is now being diverted to regional airports as indicated by the strong growth in cargo services and air cargo activity at the regional airports.
403.4	Ground Transportation	Access to Logan	The twenty five million dollars should be used to build an Airrail Terminal at the intersection of the MassPike and Route 495 with dedicated high-speed rail to and from South Station connecting to Logan. Trains would leave the terminal every fifteen minutes to get to either terminal.	Comment noted.
403.5	Ground Transportation	Access to Logan	At the MassPike/495 Airrail Terminal there should be a connector to Worcester Airport. This would take care of the inconvenience of getting to Worcester Airport.	Comment noted.

Code	Topic 1	Topic 2	Comment	Response
403.6	Regional Transportation	Regional Airports	A new International Airport must be built, probably in the area of Fort Devens. The Airrail terminal at the MassPike/495 would be the ticket terminal and Fort Devens would be the Departure Terminal.	Because the development of a second major airport would require ten to 15 years for site selection and environmental review, in addition to a multi-year construction period, this option is not viewed as a solution to accommodating forecast demand over the next 20 years. Hanscom Field's potential service area overlaps with the service areas for several airports that already have the necessary infrastructure for commercial service. These airports are the Hanscom Field, T.F. Green/Providence, and Worcester Regional, all which have had or are undergoing major improvements to their terminal buildings, other landside facilities and airfields. Refer to response to Comment 403.5.

LETTER 404

Secretary of Environmental Affairs,
Mass. Environmental Protection Agency
Mr. Arthur Pugsley, EOEA member 10458
100 Cambridge St., 20th floor
Boston, MA 02202

Dear Mr. Pugsley:

I am writing to express my distress over the potential Logan Airport expansion, with the construction of Runway 14/32. I live in Winthrop which is adjacent to the airport.

The state of the impact of Logan Airport as it exists now is intolerable. Some greatly distressing areas are as follows:

1. The brief night of sleep, as planes are still landing at 1 or 2 A.M.; then planes start revving their engines and taxiing to idling areas at 6:00 A.M.. A total of four hours sleep is not healthy for any living being, and this occurs night after night in an unrelenting situation. 404.1

2. The jet fuel smell permeates the air constantly and since the average person keeps the windows open from April to October, we have six months of this odor. The other prevailing smell is that of tire rubber burning from plane takeoffs and landings. This cannot be healthy for citizens living next to the airport. Multiply these first two areas by all of the activity per day at the airport and our health is at stake. 404.2

3. The next concern is the constant, prevailing black soot and oil that coat the inside of our window sills, our cars, railings, etc. We must be inhaling this if it is in the air in Winthrop.

4. The next area is noise pollution. Soundproofing of our homes is not the answer. What about the six months per year when our windows are open or during the entire year when we are outside the house. The major landing times are between 7 and 8:30 A.M. and 7 and 9 P.M. when there is a plane landing or taking off every 3 to 5 minutes - and unbelievable DIN OF NOISE. The Decibel level is INTOLERABLE NOW! Along with this barrage during these hours we have constant air traffic over head. WE HAVE PLANES TAKING OFF OVER OUR HOUSES CONSTANTLY. I am sure our hearing acuity has been affected by this over these years! Again, the DECIBEL LEVEL IS INTOLERABLE NOW! 404.3

Each of the above concerns is great in itself and together these require citizens to implore

the Office of Environmental Affairs to help us in the pursuit of a NIGHT CURFEW at the airport, an ENVIRONMENTAL HEALTH STUDY on the effects of POLLUTION, NOISE LEVELS, and SAFETY CONCERNS WITH OVERFLIGHTS in the town of WINTHROP and other surrounding towns. 404.4

EVERY CITIZEN of Massachusetts, Winthrop included, deserves quality of life, liberty from the constant invasion of our living space, and a full measure of happiness. Yes, the airport was here when we purchased our home, but its impact on our existence has become intolerable. We look to you and your agency to provide solutions.

Sincerely,

John & Barbara Fiorenza
62 Faun Bar Ave.
Winthrop, Ma. 02152

404.1	Noise	Impacts	The brief night of sleep, as planes are still landing at 1:00 or 2:00 AM; then planes start revving their engines and taxiing to idling areas at 6:00 AM....	The Night Equivalent Sound Level (LeqN) was calculated at 23 selected locations for all fleets and scenarios. Tables 6.2.15 and 6.2.16 of the Supplemental DEIS/FEIR report these data for the 29M Low and 37.5M High Fleet scenarios of the Supplemental DEIS/FEIR. The results show that, at most locations, the LeqN for the future fleets is lower than for the 1993 case. Where there is an increase in LeqN, the reason was the increase in flights for the No Action Alternative, which generally was mitigated by the Preferred Alternative. These results indicate that there will be less sleep disturbance in the future than that currently experienced. Refer to Section 7.4.1 of the Supplemental DEIS/FEIR for a discussion of cumulative noise impacts.
404.2	Air Quality	Odor	The jet fuel smell permeates the air constantly... The other prevailing smell is that of tire rubber burning from plane takeoffs and landings. ... [and] prevailing black soot and oil....	Massport is separately studying measures for reducing Logan Airport's contribution to air emissions in the region, in the *Logan Airport 1999 ESPR* (previously GEIR). Consideration is given to all emissions sources, and analysis is conducted for the airport, East Boston and regional study areas.
404.3	Noise	Sound Insulation	...noise pollution. Soundproofing of our homes is not the answer....	Massport's FAA-approved sound insulation program is only one element of the noise abatement program. For a discussion of the noise abatement program, refer to the discussion in the *Logan Airport 1994/1995 GEIR* and the *Logan Airport 1998 Annual Update*. Massport has existing actions initiatives underway that reduce noise impacts on nearby communities, including: Noise abatement and runway use restrictions; Exploring means of extending the Logan Airport sound insulation program through innovative investigation of hill effects on sound propagation; Encouraging growth at Worcester Regional Airport and other alternative airports; and Monitoring and improving achievement of PRAS goals.
404.4	Environmental Review Process	MEPA	[Asks for help] in the pursuit of a night curfew at the airport, an environmental health study, on the effects of pollution, noise levels and safety concerns with overflights in the town of Winthrop and other surrounding towns.	A curfew is considered an airport access restriction. According to the Noise Act, airport access restrictions are subject to FAA review and require completion of a FAR Part 161 Study. Since the Noise Act was enacted, the FAA has not approved any Part 161 access restrictions proposed by airport operators.

LETTER 405

Please stop 14/32 and the Centerfield Taxiway now. This plan is not a good idea. You will be adding so much more noise and air pollution over local communities. If you want people to continue to live in Boston neighborhoods and get involved and bring back community living, then why do this. I was at Franklin Park zoo this past week-end and I can't tell you what a thrill it was to see so many people there. Two years ago you could go there on a nice week-end and hardly see anybody there. Why bring the noise and pollution to the neighbor hood. The humans and now those animals will be affected. There is danger to increased air flights, you are disturbing the piping snadplover habitat, and most of all this will not improve congestion or delays. Why not use Hanscom Field;ed, or Worcester airport. Do you realize how many people now go to Nashua and F idence. You will only be forcing more people to go there. I live next .he Arnold arboretum and can tell you that this will impact the community greatly. Please stop 14/32 and the Centerfield Taxiway NOW!!!

Code	Topic 1	Topic 2	Comment	Response
405.1	Alternatives	Runway 14/32	....You will be adding so much more noise and air pollution over local communities....	While equivalent jet operations increase by more than 50 percent from a 1993 base to the future 37.5M High Fleet scenario if the Preferred Alternative is implemented, the appropriate basis for comparison of the Preferred Alternative is the No Action Alternative. Equivalent jet operations would increase by more than 75 percent over the Preferred Alternative if no action were taken. Despite the increase in equivalent jet operations, the Airside analysis indicates that overall noise impacts decline over time with the elimination of Stage 2 aircraft and the replacement of hushkitted Stage 3 aircraft with non-hushkitted Stage 3 aircraft. By allowing aircraft operations to shift from over-land to over-water routings and by providing greater flexibility in the use of Runways 27 and 33L for takeoff, the Preferred Alternative further reduces the highest noise impacts to the close-in neighboring communities. Furthermore, the Supplemental DEIS/FEIR also demonstrates the more equitable balance of noise impacts among communities surrounding Logan Airport that can be achieved with the Preferred Alternative as opposed to the imbalance that occurs today and would occur in the future if no action is taken.
405.2	Open Space/ Parkland	Impacts	...are disturbing the piping sandplover habitat, ...	Massport has developed a comprehensive on-site and off-site Upland Sandpiper habitat mitigation plan in close coordination with the Massachusetts Natural Heritage and Endangered Species Program (NHESP) for loss of such habitat at Logan Airport from construction of the Centerfield Taxiway. The plan strives to enhance protection of remaining Upland Sandpiper habitat at Logan Airport without increasing the aviation safety hazards typically associated with birds or hazards to the birds. Additionally, it is expected that an area of former Upland Sandpiper habitat at Camp Edwards on Cape Cod will be restored to grassland habitat by removing woody and shrub vegetation to encourage enhancement of the Upland Sandpiper regional population. This restoration effort provides a unique opportunity to expand grasslands in the Commonwealth far exceeding the ±40 acres to be lost at Logan Airport. In the event that such a program at Camp Edwards is not available, an appropriate alternative program acceptable to the NHESP will be developed and implemented. Additional details of the Upland Sandpiper mitigation plan are presented in Section 6.5 of the Supplemental DEIS/FEIR.

Code	Topic 1	Topic 2	Comment	Response
405.3	Regional Transportation	Regional Airports	Why not use Hanscom Field or Worcester Airport. Do you realize how many people now go to Nashua and Providence? ...	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR, specifically considered the role of Hanscom Field in the analysis of regional alternatives. Hanscom Field, which serves as a general aviation reliever airport to Logan Airport, already accommodates a significant number of aircraft operations (183,000 operations in 1998). The Hanscom Field activity includes private, business, charter, and air taxi operations that might otherwise use Logan Airport. Since the Airside Project Draft EIS/EIR was filed, Shuttle America, a newly founded airline, began commercial scheduled operations at Hanscom Field, offering limited turboprop services to short-haul regional markets – Trenton, Buffalo, Hartford (discontinued), Wilmington, Delaware (discontinued), and Greensboro. Shuttle America is also conducting operations between Hanscom and New York LaGuardia Airport. While Massport supports commercial service at Hanscom Field consistent with its established limits (60 seat regulation), Massport believes that Hanscom Field will maintain its role as a major general aviation reliever, and that its geographic proximity to Logan, Worcester Regional and Manchester airports will prevent its development as a significant commercial airport. Additionally, commuter airlines serving Logan Airport are unlikely to move a significant number of flights from Logan Airport to Hanscom Field, since approximately 50 percent of passengers on Logan Airport's commuter flights connect to other Logan Airport flights and a significant number of passengers are travelling to Boston. However, any new commercial service initiatives proposed for Hanscom Field shall be reviewed for consistency with the *Hanscom GEIR* (HGEIR) and its Annual Updates, and shall be considered by the Hanscom Area Town Selectmen (HATS). Refer to Section 2.6 of the Supplemental DEIS/FEIR for a discussion of Hanscom Field. Since 1995, Massport has worked closely with the City of Worcester to aggressively market the Worcester Regional Airport to airlines. Massport increased its involvement with the Worcester Regional Airport by assuming operational responsibility of the airport on January 15, 2000. By its agreement with the City of Worcester, Massport could assume ownership of the Worcester Regional Airport by 2005. On February 1, 2000, Delta Connection began serving Worcester Regional Airport with two daily nonstop roundtrip flights on regional jet aircraft to Atlanta. On July 6, 2000, American Eagle began service to New York JFK Airport with three daily nonstop roundtrip flights on turboprop aircraft. Massport is in ongoing discussions with other carriers regarding potential new services at Worcester Regional Airport. In addition, MassHighway is analyzing alternative highway routes that would improve surface access from I-90 and I-290 to the Worcester Regional Airport and filed an ENF in December 1999. They have begun the preparation of a Draft EIS/EIR for these improvements.

LETTER 407

April 5, 1999

John C. Silva, Manager
Federal Aviation Administration
Environmental Programs
Airports Division, ANE-600
New England Region
12 New England Executive Park
Burlington, MA 01803

Dear Mr. Silva,

We are opposed to the Runway 14/32 for the following reasons: 407.1

- Increased traffic and resulting noise 407.2
- Fear of catastrophic air collisions
- Time is now to look for another area for an airport, while the land is still available and within reach financially 407.3

Thank you for your consideration.

Sincerely,

Letter 407
Kimberly _____, Unknown Resident to MEPA

Code	Topic 1	Topic 2	Comment	Response
407.1	Alternatives	Runway 14/32	...Increased traffic and resulting noise	The Supplemental DEIS/FEIR projects that the Preferred Alternative would promote runway use in a manner that is more consistent with annual PRAS goals. The total number of departures from Runway 27 (over South Boston, Roxbury, and Jamaica Plain) would increase, but the number of equivalent jet operations would remain essentially the same. The difference in these communities would be fewer nighttime operations and more daytime operations but the same noise impacts. Total departures from Runway 33L and arrivals to Runway 15R (over East Boston and Chelsea) would increase, but most of these are non-jets. These runway operations are currently running well below the PRAS goals, and the unidirectional Runway 14/32 would allow the controllers to approach, but still remain below the annual goals for these operations. Additionally, by increasing the number of operations over water, Runway 14/32 would reduce the total annual hours of dwell and persistence over populated areas in accordance with short-term PRAS goals. Implementation of the recommended Airside Project, specifically unidirectional Runway 14/32, would not increase Logan Airport's normal airfield capacity of approximately 120 operations per hour. This capacity is available at Logan Airport approximately 80 percent of the time. Runway 14/32 would allow Logan Airport to maintain this capacity during periods of strong northwest winds that now require controllers to operate on only one or two runways, compared to the typical three-runway configurations used at Logan Airport. The runway would substantially reduce the delays that now occur during northwest wind conditions. Preventing these delays would represent a real benefit to the passengers and airlines that currently experience them. However, because these wind conditions and the associated delays are not regular or predictable, and cannot be readily anticipated, it is not expected that their prevention will stimulate growth in Logan Airport passenger demand above and beyond the rates that would have occurred without the runway. Instead, growth in Logan Airport passenger demand will be principally driven by local and national economic conditions, competition and pricing within the airline industry, and the distribution of airline services and passenger traffic between Logan Airport and the surrounding regional airports. The broad range of forecasts considered in the Airside Project operational and environmental analyses capture any potential variation in current and future passenger and aircraft activity at Logan Airport.
407.2	Alternatives	Runway 14/32	...Fear of catastrophic air collisions	There is no reason to link the construction of Runway 14/32 with an increased risk of catastrophic air collisions. Runway 14/32 and all of the airside improvements are designed to reduce delay, increase the airport's efficiency, improve airfield safety, and reduce negative environmental impacts.

Code	Topic 1	Topic 2	Comment	Response
407.3	Regional Transportation	Regional Airports	...Time is now to look for another area for an airport, while the land is still available and within reach financially	Because the development of a second major airport would require ten to 15 years for site selection and environmental review, in addition to a multi-year construction period, this option is not viewed as a solution to accommodating forecast demand over the next 20 years. Service developments at other surrounding airports, including Manchester Airport, T.F. Green/Providence Airport and Worcester Regional Airport, preclude the need for a second major airport. All of the other alternatives are addressed in the Supplemental DEIS/FEIR. Refer to Chapter 2 for a discussion of the emerging role of regional airports. Refer to Chapter 4 for a discussion of PPP. Refer to Chapters 4 and 8 for proposed noise mitigation and extension of the nighttime overwater routing preference (currently from 12:00am to 6:00am) to 11:00pm to 6:00am.

LETTER 408

To Whom It May Concern:

Before giving the green light to Massports proposed runway 14/32, please check the accuracy of statements and graphics presented by their representatives on Tuesday 4/13.

In Hull, we were able to find many mistakes in the graphics presented as fact- 408.1

How can we trust Massport while, during the meeting, 2 planes were heard flying over the Municipal Building - no flight pattern available for these planes. Their answer, - Pilot's choice!

Failure to address mail in this manner may result in delay of action on comments or no action on comments at all.

Dear Mr. Durand,

My comments to the EIR-Logan Airside Improvements Plan EOEA #10458 are as follows:

I AM AGAINST MASSPORTS PROJECT TO BUILD RUNWAY 14/32:

THE ABUTH TO UTILIZE OTHER AIRPORTS, HANSCOM, WORCHEST PROVIDENCE, MANCHESTER, IS NOT ONLY IMPORTANT PLANNING FOR THE FUTURE GROWTH OF OUR COMMUNITIES TO THE NORTH WEST & SOUTH OF THE GREATER BOSTON AREA BUT, ALSO LOGAN AND IT'S IMMEDIATE COMMUNITIES ARE SATURATED WITH ALL THE DIFFERENT KINDS OF POLLUTIONS IE. NOISE, ENVIRONMENTAL OF ALL KINDS — AS WE APROACH THE YEAR 2000 IT WOULD BE ENCOURAGING TO THINK THAT THE QUALITY OF OUR LIVES WERE MORE IMPORTANT THAN IT SEEMS TO BE AT THIS TIME — REGARDING THIS ISSUE

Code	Topic 1	Topic 2	Comment	Response
409.1	Regional Transportation	Regional Airports	The ability to utilize other airports, Hanscom, Worcester, Providence, Manchester is not only important planning for the future growth of our communities to the north, west and south of the greater Boston...	Chapter 2 of the Supplemental DEIS/FEIR provides a discussion of the specific role played by the regional transportation alternatives and steps that Massport has taken to foster use of these alternatives. Massport has long recognized and has been a proponent of regional alternatives to Logan Airport. Together with the regional airports, Massport has implemented a regional strategy to enhance the use of options to Logan Airport. In the Draft EIS/EIR, Massport identified up to 7.3 million annual passengers that could be absorbed by regional alternatives that include use of T.F. Green/Providence, Manchester and Worcester Regional airports, as well as the new high-speed rail to New York. In the Supplemental DEIS/FEIR, Massport recognizes that these developments will slow Logan Airport's passenger traffic growth. Logan Airport may not achieve the 37.5 million passenger forecasts until after 2010, but rather closer to 2015, and the 45 million passenger forecasts may not be achieved until after 2020. While regional alternatives can play an important role in reducing the rate of future traffic growth at Logan Airport, they do not address Logan Airport's inability to efficiently accommodate current levels of demand during northwest wind conditions. Runway 14/32, which is designed to correct the problem with Logan Airport's layout, is necessary to correct this deficiency and provides clear benefits at current aircraft traffic levels. These benefits will only increase in the future, even as developments at the regional airports act to reduce the rate of future growth at Logan Airport.
409.2	Public Health	Effects	Logan and its immediate communities are saturated with all the different kinds of pollution (i.e., noise environmental) of all kinds.	While equivalent jet operations increase by more than 50 percent from a 1993 base to the future 37.5M High Fleet scenario if the Preferred Alternative is implemented, the appropriate basis for comparison of the Preferred Alternative is the No Action Alternative. Equivalent jet operations would increase by more than 75 percent over the Preferred Alternative if no action were taken. Despite the increase in equivalent jet operations, the Airside analysis indicates that overall noise impacts decline over time with the elimination of Stage 2 aircraft and the replacement of hushkitted Stage 3 aircraft with non-hushkitted Stage 3 aircraft. By allowing aircraft operations to shift from over-land to over-water routings and by providing greater flexibility in the use of Runways 27 and 33L for takeoff, the Preferred Alternative further reduces the highest noise impacts to the close-in neighboring communities. Furthermore, the Supplemental DEIS/FEIR also demonstrates the more equitable balance of noise impacts among communities surrounding Logan Airport that can be achieved with the Preferred Alternative as opposed to the imbalance that occurs today and would occur in the future if no action is taken.

Arguments for + Against Runway 14/32

For	Against
Saves big Business Big Bucks	More than doubles VOC (Volatile Organic Compound) in closest Neighborhood
LETTER 410	
410.1	Increased NOX gas
410.2	Puts smallest + quietest planes out over water making room for larger noisier planes on existing runways.
410.3	Removes incentives for Worcester Roads + Airlines to run flights from Worcester.
410.4	Gridlocks already crowded streets + roads around logan
410.5	So close to Harbor runoff would pollute Jeffries Cove which acts as a catch basin Pollutes Harbor Island Park

Letter 410
Handwritten Comments by Unknown Resident

Code	Topic 1	Topic 2	Comment	Response
410.1	Preferred Alternatives	Runway 14/32	More than doubles VOC (volatile organic compound) in closest neighborhood. Increased NOx gas.	Furthermore, the NAAQS are not violated. Appendix A (*Ozone Modeling Support Document for the New England Domain*) of DEP's Attainment Submittal of April 1998, indicated that on-road mobile sources are a greater concern for NO_x and area sources a greater concern for VOCs than Logan Airport.
410.2	Alternatives	Runway 14/32	Puts smallest and quietest planes out over water, making room for larger, noisier planes on existing runways.	The Preferred Alternative, and specifically unidirectional Runway 14/32, would not increase Logan Airport's normal airfield capacity of approximately 120 operations per hour. This capacity is available at Logan Airport approximately 80 percent of the time. Runway 14/32 would allow Logan Airport to maintain this capacity during periods of strong northwest winds that now require controllers to operate on only one or two runways, compared to the typical three-runway configurations used at Logan Airport. The runway will not increase Logan Airport's normal operating capacity, nor will it encourage or induce an increase in aircraft operations.
410.3	Regional Transportation	Regional Airports	Removes incentives for Worcester roads and airlines to run flights from Worcester.	Since 1995, Massport has worked closely with the City of Worcester to aggressively market the Worcester Regional Airport to airlines. Massport increased its involvement with the Worcester Regional Airport by assuming operational responsibility of the airport on January 15, 2000. By its agreement with the City of Worcester, Massport could assume ownership of the Worcester Regional Airport by 2005. On February 1, 2000, Delta Connection began serving Worcester Regional Airport with two daily nonstop roundtrip flights on regional jet aircraft to Atlanta. On July 6, 2000, American Eagle began service to New York JFK Airport with three daily nonstop roundtrip flights on turboprop aircraft. Massport is in ongoing discussions with other carriers regarding potential new services at Worcester Regional Airport. In addition, MassHighway is analyzing alternative highway routes that would improve surface access from I-90 and I-290 to the Worcester Regional Airport and filed an ENF in December 1999. They have begun the preparation of a Draft EIS/EIR for these improvements.

Code	Topic 1	Topic 2	Comment	Response
410.4	Ground Transportation	Access to Logan	Gridlocks already crowded streets and roads around Logan.	The Preferred Alternative is not expected to lead to an increase in passenger demand, and therefore, it will have no effect on congestion or delays on Boston area highways. Refer to Section 4.2 of the Supplemental DEIS/FEIR.
410.5	Water Quality	Stormwater	So close to Harbor runoff would pollute Jeffries Cove which acts as a catch basin. Pollutes Harbor Island Park	No runoff from the Centerfield Taxiway or Runway 14/32 will be directly discharged to Jeffries Cove, rather it will be discharged through a series of existing outfalls along the Harbor channel. Also note that the drainage for the Maverick Street outfall will not be affected by this construction. No adverse impacts to water quality that could affect the Boston Harbor Islands are expected, as described in Section 6.6 of the Supplemental DEIS/FEIR.

LETTER 411

17 March 1999

Robert A. Durand
Secretary of the Executive Office of Environmental Affairs
100 Cambridge Street – Room 2000
Boston, MA 02202

Dear Mr. Secretary:

The elected officials, community activists and citizens of Winthrop have united with Boston neighborhoods and other communities in strong opposition to the new runway/taxiway proposal being made by Massport. We are extremely upset that the Governor, who has ignored our requests to meet, has changed his original position and is now officially endorsing the proposal. Our community leaders and citizens have been actively meeting with our state and federal government legislators to discuss our concerns regarding this specific proposal, as well as the core problem of dealing with the projections for significant increases in air traffic demand for the region. In fact, you met two of our town citizens who presented you with a letter voicing our concerns and seeking your attention on January 28th at the conference in the Seaport Hotel.

Massport has pitched the Runway 14/32 proposal as providing some relief to Winthrop at the expense of Boston and other communities. Even if true, and we have serious doubts, it would only be short-term relief. We are concerned about the entire Boston area as much as our own town. Regardless of a new runway, and according to Massport's own projections, demand for passengers and aircraft to come to the area is expected to grow significantly, and flight delays are expected to soar. As a physically small inner-city airport, Logan has exceeded reasonable capacity and cannot handle the dramatic projected demand without putting Boston, the Harbor and surrounding communities in **extreme danger!** 411.1 411.2

Please know that we support economic growth for Boston, the Commonwealth and New England. We are working closely with Senator Travaglini, Congressman Markey, Representative DeLeo and others in support of potential solutions to the regional air transportation problem, such as secondary airports, etc. There are answers to the problem which could bring economic benefit outside of Boston, but trying to increase capacity at Logan is not the answer. Such a course would be severely detrimental to those of us who call the Boston area home and, ironically, to those visitors expected to fly here as well. Our health and safety are already at great risk. Our burden has increased each year. We cannot accept more! 411.3

Sir, we need your attention to this issue. We ask that you meet with a group of our town officials and community leaders **before** you review the Environmental Impact Report to hear our concerns. Your Department has previously criticized past Massport studies. There are **serious** questions regarding the adequacy, quality and reliability of information supplied by Massport. Winthrop has been ignored in requests for needed health studies. We ask you to understand that the health and quality of life of Boston area residents is threatened. We hope you agree that full input from Winthrop and the other communities is **essential** before your office reaches any decisions that will impact so many Boston area residents. 411.4

Respectfully,

Ellen Winkler

Letter 411
Ellen Winkler, Brock Philips, David Prusky, L. Gertrude Honan, Barbara Bishop, George McLaughlin, Rebecca Swope, and Henry Carson

Code	Topic 1	Topic 2	Comment	Response
411.1	Alternatives	Runway 14/32	Massport has pitched the Runway 14/32 proposal as providing some relief to Winthrop at the expense of Boston and other communities. Even if true, and we have serious doubts [about that], it would only be short-term relief.	PRAS noise goals are based on the fact that DNL levels above 75 dB are considered unacceptable for residential land use and that DNL levels above 70 dB are also excessively high and should be reduced if feasible. PRAS recommendations are thus designed to shift operations off of runways where these high levels still exist – primarily in Winthrop and to the north of Logan Airport in East Boston and Revere. The EOEA May 7, 1999 Certificate on the Airside Draft EIS/EIR requested that Massport undertake a feasibility study of implementing measures to reduce NOx emissions at Logan Airport. This study is currently underway and will be presented to MEPA by the end of March 2001. Appendix A (*Ozone Modeling Support Document for the New England Domain*) of DEP's Attainment Submittal of April 1998, indicated that on-road mobile sources are a greater concern for NO_x and area sources a greater concern for VOCs than Logan Airport.
411.2	Alternatives	Preferred Alternatives	...As a physically small inner-city airport, Logan has exceeded reasonable capacity and cannot handle the dramatic projected demand without putting Boston, the Harbor and surrounding communities in extreme danger!	Anticipated future passenger and operations levels can be accommodated by Logan Airport without any airside improvements but not without delays and resulting adverse environmental impacts. The goals of the Airside Project are to reduce delays, increase the airport's efficiency and improve airfield safety in an environmentally responsible manner. Long-term aviation growth is a recognized worldwide condition, based on economic and demographic factors, and is not under Massport's control. Massport estimates that up to 7.3 million Logan Airport air passengers may be diverted to other modes/airports or eliminated through advances in telecommunications.
411.3	Regional Transportation	Regional Airports	We ... support ... potential solutions to the regional air transportation problem, such as secondary airports, etc.... There are answers to the [regional transportation] problem which could bring economic benefit outside of Boston, but trying to increase capacity at Logan is not the answer.	A second major airport is not a solution to the current delay and congestion problems at Logan Airport. The Proposed Project to reduce delay and enhance safety at Logan Airport must be implemented in the near term to address current and future operating conditions. Even if a second major airport were to be pursued, the planning period for site selection and environmental review would require ten to 15 years, in addition to a multi-year construction period. Rather, Logan Airport is part of a regional system of airports that includes the T.F. Green/Providence, the Manchester, and the Worcester Regional airports. Service development and increased passenger traffic at these airports are an important part of the region's long-term strategy to accommodate passenger and activity growth. Greater use of the regional airports will provide passengers within the service area of such airports with a viable alternative to Logan Airport. Since demand within Logan Airport's primary service area will remain strong, the improvements at other regional airports will not eliminate the need for improvements to be implemented under the Preferred Alternative at Logan Airport.

P:\projects\25466\Docs\Reports\Comments and Responses\Private Citizens.doc

Code	Topic 1	Topic 2	Comment	Response
411.4	Public Health	Effects	Requests for needed health studies [have been ignored]...health and quality of life of Boston area residents is threatened...	Noise was identified as the only off-airport impact associated with the Preferred Alternative (refer to Section 6.2 of the Supplemental DEIS/FEIR for a discussion on noise impacts). The available public health studies for communities adjacent to Logan Airport were reviewed and are presented in Section 6.8 of the Supplemental DEIS/FEIR. A review of the available public health information did not indicate any causal relationship based on proximity to the airport.

LETTER 412

Marriott
HOTELS · RESORTS · SUITES

Boston Marriott Cambridge

Two Cambridge Center
Corner of Broadway and Third Street
Cambridge, Massachusetts 02142

April 8, 1999

Jeff Miller
General Manager

617/494-6565 Fax

Mr. John C. Silva, Manager
Environmental Programs
Airports Division, ANE-600
New England Region
12 New England Executive Park
Burlington, MA 01803

Dear Mr. Silva:

The hotel industry is one that relies heavily on air transportation. In fact one of the deciding factors meeting planners must consider after hotel accommodations and convention space is reliability and capacity of incoming and departing flights. With the future development of the new convention center and Seaport District, Logan's role becomes even more critical to our industry. 412.1

While we can appreciate the credibility of exploring alternate regional airports for increased use, Logan will be just minutes away from the new convention center and offers a tremendous advantage over other competing cities who do not have this type of close proximity. Moreover, we need to show convention travelers that Logan is serious about improving from its current position of the sixth worst delay plagued airport in the country. 412.2

I urge you to please support and work towards the development of runway 14/32 for Logan. Only with improved capacity and a more efficient Logan Airport can we truly realize the full potential of our new convention center and hospitality industry. 412.3

Sincerely,

Jeff Miller
General Manager

PROCEEDINGS

THE MODERATOR: I officially declare this hearing opening. It's now 6:30. Good evening, ladies and gentlemen. My name is Chris Poreda. I'm a senior attorney with the Federal Aviation Administration's office and the regional counsel of the New England region. I will act as the hearing officer or moderator for this evening's meeting.

This meeting is jointly sponsored by FAA and Massport. I'd like to thank the commonwealth of Massachusetts for allowing us to use these facilities, and I welcome those individuals who are here this evening to listen and make public comment. I also want to welcome members of the media, though I would ask that you remain as unobtrusive as possible while performing your valuable function to cover this event.

This meeting is being transcribed so each of us who speaks needs to remember to speak clearly, use the microphones, and identify yourself, spelling your last name, if possible.

Before I introduce those individuals who will make presentations tonight and the rest of the people at the front of the room, I must briefly outline the purpose of the meeting for the record. After those public presentations, then I'll open the meeting for public comment.

The purpose of this meeting is to receive public comment on proposed airport developments at Logan International Airport. Those proposed developments are detailed in a document jointly with the Federal Aviation Administration and Massport entitled Logan Air Side Improvements Plan Project dated February 1999. This joint document serves as both a draft environmental impact statement to meet the procedural requirements of the National Environmental Policy Act, or NEPA, and other federal requirements, and is a draft environmental impact report to meet the requirements of the Massachusetts Environmental Policy Act, or MEPA, and other state requirements.

The FAA is the lead agency for

purposes of airport layout plan approval and any funding approval which are federal actions subject to NEPA. Massport is the project proponent for the proposed developments which fall within its purview as the proprietor of Logan International Airport.

The draft EIS/EIR was sent to several elected officials, community leaders, and federal, state, and local government offices. In addition, copies of the document were sent to public libraries in Boston, Brookline, Chelsea, Charlestown, Milton, Quincy, Revere, Somerville, and Winthrop. A notice seeking comment from that document was published in the Federal Register on February the 26th, 1999, and appears on Page 9508 of Volume 64 of the Federal Register.

Here this evening from the Federal Aviation Administration to my right and to the left of me as you look at me is John Silva, environmental programs manager in the airport's division of the Federal Aviation Administration's New England region. On my

left, your right, from the Massachusetts Environmental Policy Act office are Jay Wickersham and Arthur Pugsley. From Massport we have Flavio Leo, director of aviation planning, Betty Desrosiers, director of planning and development, Deborah Meehan, project manager from SH&E, a consultant to Massport on this project, and David Hollander, a planner from SH&E.

At this point, we will have short statements by John Silva and the representative from the Massachusetts Environmental Policy Act office. Following those statements, Betty Desrosiers from Massport will make a brief 15-minute presentation. At that point, we'll take a short break, and then I will open the floor to public comment. John.

MR. SILVA: Good evening. My name is John Silva, and I'm manager of environmental programs with airports division, New England region, Federal Aviation Administration. I'm FAA's project manager for the environmental impact

statement. This hearing is being conducted to be our public input requirements under the Council on Environmental Quality regulations, and the Airport and Airway Improvement Act as amended and recodified. The hearing will be conducted this evening and tomorrow evening at 6:30 p.m. at the Holiday Inn, McLellan Highway, East Boston. That's adjacent to Suffolk Downs.

In addition to the opportunity to provide comments this evening, a written comment period on the draft EIS/EIR will remain open until April the 23rd, 1999. Comments may be mailed to me, John Silva, S-I-L-V-A. My address is Airports Division, FAA, New England Region, 12 New England Executive Park in Burlington, Massachusetts, and the zip there is 01083.

Alternatively, you may mail comments to the Secretary of Environmental Affairs. The address is Attention: MEPA, that's M-E-P-A, office, Mr. Arthur Pugsley, P-U-G-S-L-E-Y, EOEA Number 10458. The street address is 100 Cambridge Street, 20th Floor,

Boston, Massachusetts, and the zip there is 02202.

I'd also like to add that if you have written comments here this evening and you'd like to deliver them to us, there is a box for other testimony at the end of the table there.

THE MODERATOR: Thank you, John. At this point, let me make a verbal footnote. Although I am also an employee of the Federal Aviation Administration, I will take, personally no part in the decision involving this document or this project or review of the comments. I am here strictly as a moderator for this evening's meeting and tomorrow evening's meeting.

Now we'll hear from the Massachusetts Environmental Policy Act office.

MR. WICKERSHAM: Thank you, Chris. I am Jay Wickersham from the MEPA office in the Executive Office of Environmental Affairs. With me is Arthur Pugsley who is the MEPA analyst who is assigned to this

project.

The purpose of review of this project under the MEPA statute is to insure that Massport, as a state agency, has taken all feasible measures to avoid, minimize, or mitigate the adverse environmental impacts of its actions. The purpose of the MEPA review process is to insure an open public review and comment period on the documents. The MEPA process is not a permitting or an approval process.

The comments that we are receiving are as to the adequacy of the draft environmental impact report which has been submitted. We encourage comments to be as specific as possible, and to address both the general requirements of the MEPA regulations which are at 301 CMR 11, and also the specific requirements in the scope that was issued by Secretary Cox in November of 1995. You will find the scope that applies to the draft environmental impact report at the front of Volume 2 of the document submitted by Massport.

As John and Chris have stated, in addition to the spoken comments today, we are receiving comments. We are receiving those through Friday, April 23rd. Comments should be received at the MEPA office by 5 p.m. on that date. Again, I'll quickly give the address which is 100 Cambridge Street, Boston, 02202, Attention, Arthur Pugsley, and be sure to make sure that all correspondence has the EOEA file number which is 10458. These addresses as well as the fax number of the MEPA office are also found outside by the locations of the sign-in sheets.

THE MODERATOR: Before Massport gives its presentation, I'll remind people again that when I open the floor to public comment, I will be recognizing people to speak by the sign-up sheets that were outside the front door, so if you want to speak, please avail yourselves of those sign-up sheets. That's what I'll be using to recognize people in order to make comments.

Now we hear from Betty Desrosiers from Massport.

MS. DESROSIERS: Thank you and good evening. Over the last three-and-a-half months, Peter Blute, Tom Kenton and I have participated in over 45 public forums and addressed over 3,500 people about this project and tried to provide a detailed overview of the project and listen very carefully to comments that we have heard in each of those forums. Before the close of the comment period on April 23rd, we expect that number of forums will increase to nearly 50 forums.

I know that many of you in this room have participated in one or more of those forums, and tonight's presentation is a shortened version of what you have seen earlier. And for those of you that have not yet had the opportunity to hear the overview of this project, tonight's is a shortened version but I think it is a comprehensive one. So with that, let me begin.

Logan Airport is a very important component of the state and regional economy. It employs 15,000 people, and it contributes

5 billion dollars into the economy, nearly 1.4 billion direct, 3.6 billion indirect. Businesses in the greater Boston area alone, 79 percent of the businesses in the greater Boston area rely on convenient and safe air service at Logan Airport to do their business, and indeed, the high growth industries of New England and Massachusetts, manufacturing, communications, business services, management services expect that their reliance on air travel and on Logan Airport is going to grow over time.

Logan Airport has a problem today, and our problem is a delay problem. It is a delay problem primarily caused by wind and weather conditions. By any measure of indices of delay, Logan Airport has, for over a decade, ranked amongst the worst airports in the United States for delays. This is unacceptable for the traveling public. It is unacceptable to our neighbors because these delays cause adverse environmental impacts.

We have used as part of this environmental impact study state of the art

simulation modeling that was developed by world-renowned experts at MIT in the flight transportation lab. Indeed, this modeling has been used by airports within the United States and across the globe. It is a very sophisticated model, and it is exactly the type of model that is appropriate for the kind of complexity of operation that we have at Logan Airport because we are located in New England with very varied wind conditions.

So we sought out and selected a model appropriate to the kind of operation that we have at Logan Airport. It is a model that has been embraced by the FAA. It is a model that has been embraced by airports around the globe. That model has shown that Logan Airport experiences today over 120,000 hours of delay at a cost of over 300 million dollars to the economy including the passengers and the airlines.

This proposal to improve the airfield at Logan Airport is part of a multi-airport, multi-modal air travel transportation plan that has been developed

for over a decade, and for which the FAA and the New England states have invested over 600 million dollars to realize. This planning and investment strategy began in 1990 with the second airport study.

That study, by the way, had a 52-member blue ribbon panel comprised of community groups, business groups, and environmental organizations. The conclusion of that study was that it is likely infeasible to build a second airport in Massachusetts and instead, a second study was conducted called the Strategic Assessment Report which looked and, in fact, developed the strategy that has since that point already been implemented.

That strategy looked to improve the regional airport, looked to high-speed rail, and looked to Logan. Following on the Strategic Assessment Report, the New England state aviation directors and Massport began meeting on a regular basis to, in fact, advance and develop the regional airport strategy, and we did that arm-in-arm with the

FAA.

As a result of these studies, what has occurred is that we have seen significant investments in New England's regional airport. We have indeed seen high-speed rail become a reality. It is being tested today. High-speed rail will begin between Boston and New York later this year. High-speed rail has become a reality. The investment and the increased activity at the regional airports has occurred.

What this proposal looks to do is to complete the last piece of that puzzle which is also to make appropriate improvements at Logan Airport to address the delay conditions that we experience there. This is the regional airport system. This is the system, these airports, Logan Airport as the premier airport for the region of Manchester to the north, Green to the south, and Worcester to the west. These are the airports that collectively will handle the air travel demand that we in this region, that we in this commonwealth are indeed

generating.

And, in fact, what we are seeing as a result of the growth in the regional airport is that Logan Airport is carrying a smaller and smaller share of the total travel within New England, a smaller and smaller proportional share. That is precisely what I think we ought to collectively share as we go along.

What did we find? What did all these studies find about the extent to which these other alternatives could help to address the delay problem at Logan Airport? What these studies collectively found is that these alternatives could reduce demand at Logan Airport by about 7.3 million passengers. That's a tremendous help to Logan Airport, but it does not preclude the need to improve Logan's airfield.

What are we trying to do with this package of improvements? We are looking to reduce delays at Logan Airport, enhance the operational efficiencies of our airport, to enhance safety, and to do that by minimizing

environmental impact, and we believe that our document demonstrates that indeed we have and can do that.

What we are proposing -- our package of improvements include the following. The most well-known is a unidirectional runway 14/32, a series of taxiway improvements, the most well-known of which is the center field taxiway. The FAA is seeking to reduce the minimums of several of our runway ends, and we looked at peak hour pricing.

The environmental document itself has five alternatives structured in it. The alternatives allow for a comprehensive assessment of these improvements and an evaluation of the key concepts compared one to another. How will conditions be if we do everything? How will conditions be if we do everything but peak hour pricing? How will it be if we do everything but if we only do the taxiways? And how will it be if we only do the administrative actions, and what will conditions be if we do nothing?

As the result of the work that we have done over the last four years, we have selected alternative 1A as our preferred alternative for this project. How does this preferred alternative help us deal with delays at Logan Airport? What we see is that if we do nothing at Logan Airport, if we do not do anything at Logan Airport, delays at Logan Airport are going to increase and they are going to increase expidentially.

If we are able to build runway 14/32, then delays at Logan Airport will indeed go down and dramatically level off in the future. And what is very important to note is that delays, the delay reduction benefits of runway 14/32 increase over time. This is not a mandate. This is not a mandate program. Delay will always be less by building this runway, and delays in the future will clearly stabilize.

What do the environmental results show? What the environmental results show with respect to noise is that by being able to build runway 14/32 and a center field

taxiway, that we are able to reduce noise for those communities that live in the highest noise-impacted areas. There is nothing else that can be done to provide relief to those close-in communities but build this runway. It is the thing that provides that relief.

The second thing that we have found is that by reducing delays we are able to reduce late-night operations. The third thing we are able to find is that by building runway 14/32, we are able to take better advantage of our location adjacent to the harbor. We are able to shift 75,000 flights out over the water rather than over people's homes, and that is good for everybody close-in or out.

The last thing it does, it allows the air traffic control tower to have a more equitable distribution of noise at Logan Airport north, south, east, and west, and I'd like to show you a little bit how important the goal of equitable distribution is. Today, 76 percent of our operations are over communities north and south of the airport.

If we are not able to build runway 14/32, nearly 90 percent of the operations will occur over communities that lie north and south of Logan Airport.

If you live in Braintree, Milton, Dorchester, Quincy, South Boston, East Boston, Winthrop, Revere, Swampscott, this is what your future holds if we are not able to build runway 14/32. By building the runway, we are indeed able to create a much more balanced distribution of over-flights at Logan Airport. This is the goal that I think from a public policy perspective and indeed from a community's perspective when we established the community noise goals, this is what we were seeking to do, not that.

In terms of mitigation, what we propose to mitigate with this airport is the following. We guarantee that this runway will be a unidirectional runway, and we will use every independent mechanism available to insure unidirectionality, and we do that and we are proposing that in the following way. We are proposing that by seeking only the

permits to build it as a unidirectional runway.

We are seeking that by including it as part of a mitigation measure in our environmental document, and we are guaranteeing that by seeking relief for only unidirectional operations from the court injunction. Every independent mechanism available to us we will employ to insure the unidirectionality.

In addition, we will soundproof an additional 1200 to 1500 homes in those communities where the noise contour does go up as a result of more equitable distribution of noise. And the final key element of our mitigation program is to create or replicate a new habitat for the upland sandpiper which does come to Logan Airport, if you can believe that, right between runways. We are working with the state agencies to develop a program to establish a replication site for the upland sandpiper down in Cape Cod.

These are the key elements of our mitigation measures, and I believe that

that's the end of the overview. I thank you very much for your patience in letting me go through this presentation, and I look forward to hearing your comments this evening.

THE MODERATOR: Thank you very much, Betty. Now that I'm out of the spotlight, what we're going to do is take a five-minute break, and then I'll open the floor to comments. I will start the meeting again in five minutes so I would ask that if you have business to conduct that's going to take longer than that, please go outside. In five minutes, we will reconvene.

(Brief recess taken.)

THE MODERATOR: As part of the rules, we recognize that everybody here has an opportunity to speak, everybody here has an opportunity for their opinion. We should be civil to anybody who is speaking, and keep your comments civil and unemotional. I know this issue sparks a lot of controversy, and with good reason. Again, I'd remind you that the meeting is being transcribed, so when people come to the microphone, please speak

clearly, slowly, enunciate, and identify yourselves before you begin your comment. And if you can remember, spell your last name. That would help Pete, our stenographer, out greatly.

After everyone has had an opportunity to speak and if we still have time left in the evening, it may be an opportunity to speak again. One of the things that we're not going to permit, though, is to allow one speaker to donate time to the next speaker.

I will announce two people at one time so you can be prepared not only to mentally be prepared for your own comments, but also so that as soon as one person ends comment, then the next person can start right away. In the beginning, at least, we will alternate comments of who opposes the project with the comments of who supports the project.

It's important to recognize what the point of the meeting here is. This is not a forum for debate with the officials

that have presented the draft report. I will allow short questions for clarification or maybe procedural questions, but I will not allow questions or responses to comments that will engage in a debate on the merits of the draft EIS. There have been many public hearings that were heard already for that purpose, and you have an opportunity to not only speak tonight but give us written comments or give to the agencies written comments on your views.

Finally, please try to refrain from applause or other forms of verbal approval or disapproval because that only takes away from the time we all have to listen to everyone's comments, and I want to move the meeting along as efficiently as possible.

First, before we hear comments, there are some government officials that wish to be recognized. Boston City Councilor Mickey Roache and Boston City Councilor Paul Scappichio. My apologies to the councilor for mispronouncing his name. We will take those government officials and those

officials representing agencies first. First we'll hear from State Representative Bruce Ayers of Quincy followed by Selectman Robert Driscoll of Winthrop.

MR. AYERS: Thank you. Bruce Ayers. I'm here tonight, ladies and gentlemen, in a dual capacity. Not only am I a state representative but also a city councilor in the city of Quincy, and I've been fortunate enough to be a city councilor in Quincy for the past eight years, and one of the most consistent complaints I've received from the city of Quincy has been the amount of airplane noise and pollution flying over my district not only of North Quincy but also Squantum. T1.1

I strongly oppose runway 14/32 because it's only going to increase the problems to my constituents. Based on the feedback that I've received, I introduced a resolve before the city council meeting last Monday night, and I will try to be brief and articulate the points that I brought up at the council meeting.

Whereas, they have not fully examined the alternatives to the airport expansion like Hanscom Field and Worcester Airport; whereas, other transportation accesses like regional airports Green in Rhode Island and Manchester in New Hampshire; and whereas other management tools that could be used to alleviate delays such as peak period management programs; and whereas, the operation of the new runway would severely impact several neighborhoods in my district in the city of Quincy, especially Squantum, West Quincy, North Quincy, Montclair, Houghes Neck, Merrymount, Wollaston. T1.1.1 T1.1.2 T1.1.3

And most importantly, being a state representative and city councilor is the importance to have public meetings, and we've done this over the years many, many times, and I feel that Massport has not come out and asked the city of Quincy to have or to hold a public meeting. T1.1.4

So one of the reasons I wanted to come here tonight was to invite the officials down to the Quincy City Council for a public

meeting, and I'd also like to extend that opportunity to a community meeting so that, based on some of the concerns we're addressing tonight, ladies and gentlemen, could be better understood. It would give my constituents a better understanding as to what impacts we'll have. Whether it's quality of life issues like noise pollution or air pollution, they will better understand it, and they haven't been given any chance. I think it's unfair.

So I come before you tonight to submit written testimony from several of the community centers, and also request that the Federal Aviation Administration withdraw its support for the expansion until these questions are addressed and answered. I don't think it's fair. The amount of calls I am receiving are strongly opposed to this. We need more information. We need to protect the quality of life throughout the South Shore and our community, and we have some serious concerns here that aren't being addressed.

T1.1.5

This resolve was based on a lot of points that are unresolved, and they were put into a form which was unanimously passed by the Quincy City Council. So I'd like to submit that along with other documentation I have from various residents who wrote to me, and neighborhood associations who are very much concerned. So based on that, I would like to voice my opposition not only as a city official but as a state representative for these areas. Thank you.

THE MODERATOR: Thank you, Representative Ayers. Representative Ayers actually went to the microphone. I meant to comment on the media has requested that people who wish to be heard by them use the microphone to my left, not the one in the center of the room because that's the one they're hooked up with. Next we'll hear from Selectman Robert Driscoll of Winthrop, followed by Steve Muench, Massachusetts Aeronautical Commission.

MR. DRISCOLL: Good evening. My name is Robert Driscoll, Jr., and I'm one of

T1.2

the members of the Board of Selectmen for the town of Winthrop, and thank you for having us here tonight. The town of Winthrop, the Board of Selectmen, unanimously all oppose the project of 14/32 and the center field taxiway, and I think Winthrop's in kind of a unique situation because we are one of the few communities that, according to projections from the EIS, the EIR, are supposed to benefit in some way because of a reduction in the use of the runways that most impact our community.

A lot of people are asking us why we're opposed to this project if our town is going to benefit, and the answer to that question is that there's a long history of treating our town which happens to be a host community to Logan Airport, runways 22 left and 22 right begin actually within the boundaries of the town of Winthrop, we have had a long history of working with Massport and we have had a long history of responding in the past to GEIR and updates and EEIS and all that.

And I think that one thing that we've always been consistent in is that we've always taken the position that these impacts cannot be looked at on a segmented basis. We've tried to implore MEPA on that argument, not successfully in the past, but I think that's something that we've been consistent about and that is primarily the reason we are opposed to this because we don't believe the EIS, the EIR looks at all of the total cumulative impacts of building 14/32 and building the center taxiway. T1.2.1

Because we've had such a long-standing working relationship with Massport, we have a good sense of their ability or inability to come forward and meet commitments that pertain to the use of the runway, and I think the PRAS goals is probably the best example of that. PRAS goals was established some time ago, and if PRAS goals were actually adhered to, the town of Winthrop would be in much better environmental condition than it is today, yet those goals cannot be attained.

And part of the argument for 14/32 and the center field is based on the ability to achieve something like PRAS goals again. However, we're not sure, we don't feel confident that Massport and the FAA will be able to commit to meet those objectives. In fact, we had asked Massport at a meeting in Winthrop at the Winthrop Arms whether or not they could commit somehow to the EIR and the EIS to guarantee the runway usages, and we were informed, I think as we expected, that no, that's not going to be possible because there are too many factors beyond their control, the FAA being a factor, the weather being a factor.

So I think that between the PRAS goals not having been met and with the fact that there's no accountability for meeting these runway objectives, that leads the town to conclude that this is not a good alternative, it doesn't look at the whole picture, and we think that the EIR should be withdrawn. Thank you. T1.2.2

THE MODERATOR: Thank you, Mr.

Driscoll. Next we'll hear from Steve Muench from the Massachusetts Aeronautics Commission, followed by Paul Guzzi from the Greater Boston Chamber of Commerce.

T1.3

MR. MUENCH: Good evening. For the record, my name is Steve Muench. That's M-U-E-N-C-H. I am the executive director of the Massachusetts Aeronautics Commission. Contrary to published reports, considerable regional planning has been done on a multi-state level. The six directors of the New England state agencies that have a responsibility for oversight of aeronautical activities within their respective states have been working with the Federal Aviation Administration, the Massachusetts Port Authority, the New England Council, and nine regional airports since 1994 to improve air service throughout New England.

Those regional airports are Worcester Regional Airport and New Bedford Regional Airport in Massachusetts, Manchester Airport in New Hampshire, T.F. Green Airport in Rhode Island, Bradley International

Airport and TWI-New Haven Airport in Connecticut, Bangor International Airport and Portland International Jetport in Maine, and Burlington International Airport in Vermont.

In 1990, the Massachusetts Aeronautics Commission initiated a siting study commonly referred to as the second major airport study to determine whether there were any suitable sites for a second major airport in Massachusetts. That study started with 182 sites, and eventually recommended consideration of two sites, at Fort Devens and in the Gardner-Winchendon area.

In 1992, we announced that we would reevaluate air transportation demand and capacity in the context of a multi-modal high-speed transportation system, and initiated a second study commonly referred to as the strategic assessment report study. In November 1993, that study reconfirmed that the demand for air service at Logan will surpass capacity.

More importantly, however, the

study also identified a number of scenarios which it implemented to avoid the necessity for construction of a second major airport to meet that excess demand. Those scenarios involve improving air service at regional airports, improving rail service, improving telecommunications technology, and making air side improvements at Logan.

The logic behind the pursuit of these alternative solutions is obvious given the staggering financial, environmental, and social cost to construct a second major airport. Our ongoing regional planning efforts are a natural progression from the second major airport and strategic assessment report studies, and complement the analysis of surface transportation performed under the New England Transportation initiative.

Today we have identified existing air service levels, estimated the degree of leakage for each airport which is defined as the number of passengers in a regional airport's marketing area that use either Logan or one of the three New York City

airports, Laguardia, JFK, or Newark.

We analyzed the potential for improved or new air service at the regional airports in New England, conducted a regional airports route development conference where representatives of the regional airports actually met with representatives of more than a dozen major regional and Canadian air carriers.

We assessed the potential impacts that improved air service at regional airports would have on Logan. We designed the regional airport fair sampling methodology, and analyzed the results of a common fair pricing strategy at a regional airport.

In 1998, approximately 40 percent of the domestic destination passengers departing from those regional airports and Logan departed from the regional airports. That's up from 35 percent in 1996. In that two-year period, the total number of domestic enplanements at all ten airports rose by 13.4 percent.

However, domestic enplanements at the nine regional airports increased by more than 31 percent while Logan's domestic enplanements only increased by approximately 4 percent. Clearly, the combined efforts of the six-state aviation agencies, the nine regional airports, the FAA, Massport, and the New England Council are diverting demand away from Logan and to the regional airports.

Each year, as the state directors and regional airports work with the FAA to update their respective capital improvement plans, we consider both the local and regional impacts of those proposed capital improvements. The new airport terminal, runway extensions, and other improvements at Manchester, New Bedford, T.F. Green, and Worcester are all complementary of our individual and joint efforts to improve regional air service throughout New England, and they all contribute to reducing delays at Logan.

We urge you to approve the air side improvements proposed by Massport. They are

T1.3.1

necessary to insure a safe and efficient New England airport system to serve scheduled passengers, and similarly, we oppose efforts to artificially constrain demand for the employment of peak hour pricing or peak period pricing. T1.3.2

Notwithstanding the success of those regional airports, communities throughout New England will continue to use Logan for markets not served by those regional airports. Thank you very much for this opportunity to offer these comments this evening.

THE MODERATOR: Thank you, Mr. Muench. Are you going to also submit that written paper?

MR. MUENCH: We will next week. It's going to be signed by the other directors.

THE MODERATOR: Now we'll hear from Paul Guzzi from the Greater Boston Chamber of Commerce. Did I pronounce that right?

MR. GUZZI: Good evening. I've been called far worse. My name is Paul T1.4

Guzzi.

THE MODERATOR: Excuse me just a second, Mr. Guzzi. Following him, we will hear from Andrea D'Amato from the city of Boston.

MR. GUZZI: I am president and CEO of the Greater Boston Chamber of Commerce. Let me try to summarize my written comments which I will submit. The Chamber as well as other business organizations is supportive of both the runway 14/32, and as well we are supportive of regional solutions and expansion of capacity on a regional basis. T1.4.1

In a word, we are supportive for three reasons. One, we think that air transportation issues, Logan and regional air transportation issues together, are critical for our economic well-being, are critical for economic growth, are critical for jobs in this area.

All too often, this debate has been focused around a we-they type of dichotomy. The employer community that I represent, the employer community that others represent,

employ individuals, employ people. You've seen the economic impacts in the prior slides that Massport put up. You've seen the estimate of some 300 million dollars of lost productivity.

What you haven't seen is the impact of an inferior regional air transportation system including Logan that impacts not only the expansion of companies within our region and within our state, but also the relocation of companies into our region as well. We are supportive of this because of economic growth and jobs that are provided for people.

Second, we are supportive because of the delays that occur at Logan. The data that we have looked at, the data that has been supplied by independent national agencies, all indicates the same thing. Whether you rank Logan second, third, sixth, or seventh, Logan is delay-prone, and with the increases projected, with or without the airport runway extension, these delays will get worse, not better. Delays are important not only for competitiveness, delays are

important not only for attracting individuals and tourists into our area, delays impact individual people, individual families.

Finally, let me say that we are supportive of this extension, we are supportive of increases in regional air capacity, and we are supportive of a more regional and more comprehensive transportation policy within our region and within our state. I congratulate this group for attempting not only to streamline the process, but to have an environment where data and alternatives can be looked at, where people can come together not in terms of we against them, but in terms of all of us trying to provide regional solutions to regional problems that will benefit all of us. Thank you very much.

THE MODERATOR: Thank you. Now while we're waiting for Andrea D'Amato to come forward, let's go off the record for a second.

(Off the record.)

THE MODERATOR: Back on the record.

Now we'll hear from Andrea D'Amato from the city of Boston, followed by Todd Fontancella from the city of Somerville.

MS. D'AMATO: Good evening. Thank you, members of Massport, the FAA, and the state MEPA for the opportunity to come here tonight. I am Andrea D'Amato, chief of environmental services for the city of Boston, and also the commissioner of transportation for the city of Boston. My name is spelled D apostrophe capital A-M-A-T-O. I'm here tonight to read into the record testimony of the mayor of the city of Boston, Thomas Menino. T1.5

The Massachusetts Port Authority projects that passenger traffic at Logan Airport will grow 26 million in 1998, with as many as 45 million by 2010, an increase of roughly 33 percent. More passenger traffic at Logan Airport will only mean more cars, trucks, and shuttle buses on our congested highways and our urban road system.

During peak travel times, this could make traffic congestion unbearable on

the Southeast Expressway and Route 1A. It will also encourage more drivers to seek alternative routes, worsening congestion on roads such as Storrow Drive.

The majority of Logan's users actually come from beyond the Route 128 area, according to Massport's 1996 data. These people are not getting to Logan via the Blue Line. They are driving long distances at great lengths of time on congested roads. As traffic at Logan expands, road traffic congestion will grow worse. More vehicles will be on the roads, and suburban travelers may not be able to get to Logan on time.

There will be more traffic on our urban road systems during peak travel time which raises the issue of whether residents near Logan Airport will be able to navigate their own community, and whether employees will be able to travel to and from work without further delay.

Finally, the addition of more vehicles to our roads increases concerns about environmental and economic impact,

traffic congestion, air pollution, of lost time and productivity. The region is already in serious non-containment of the air quality standards for ozone according to the U.S. Environmental Protection Agency.

Massport's environmental impact statement report addresses none of this. It is incomplete because it avoids the land side impact of airport growth. Air side and land side impacts are related and inseparable. I therefore respectfully request that you require the Massport board to provide a full and complete accounting of all the land side impacts of its improvements before proceeding any further. To do so would only deny the people of greater Boston the answers they deserve. Respectfully submitted, Mayor Thomas Menino. Thank you very much. T1.5.1

THE MODERATOR: Thank you. We'll now hear from Todd Fontancella, followed by Phil Lemnios from the town of Hull.

MR. FONTANCELLA: Thank you. I represent the city of Somerville administration, and I'm here to register our T1.6

opposition to the construction of runway 14/32. About a year ago, our administration became involved with the Citizens Advisory Committee to Massport, and we became deeply involved in the review of the improvements that are proposed for Logan Airport.

In the context of that study, a great deal of information has been presented in a number of forums, and we have listened to all of the other members of the Citizens Advisory Committee. Many of the points that Commissioner D'Amato just made were the ones that we also felt very strongly about. We can't emphasize strongly enough that we have come away from reviewing the document with a feeling that, although a lot has been said about regional cooperation, in fact, there remains a great deal of work to be done.

Regional travel requires regional solutions. We do feel that at this time, given the information that's been presented, that it is inadequate in one key area. Again, that the land side improvements that are proposed for the airport are not

T1.6.1

coordinated with this document. They do function together and they need to be given more priority in the context of this EIR/EIS.

So with that, I would like to state for the record officially that the city of Somerville also opposes runway 14/32. Thank you.

THE MODERATOR: Thank you very much. Now the representative from the town of Hull, Mr. Lemnios. After Mr. Lemnios, we'll hear from Bernice Mader from the Norfolk-Plymouth Counties Democratic Committee.

MR. LEMNIOS: My name is Phil Lemnios, L-E-M-N-I-O-S. I'm the town manager in Hull representing the town of Hull. The town of Hull is opposed to this runway. We're one of the two communities, and probably the only community that sees an increase of about 50,000 flights over our community if this runway were to be built. That's our primary reason for being opposed, obviously. T1.7 T1.7.1

Just as a quick aside, I find it

interesting that we're going to relocate the sandpipers to Cape Cod because the noise might disturb them but not the rest of us poor humans. It seems to me that there are some real technical credibility issues that are at stake here. This morning's Boston Globe had a very interesting article. The slide Betty put up showed that the FAA has one methodology of measuring delay, the Department of Transportation has another.

The FAA says 3.18 percent, the Department of Transportation has a blended rate of 20-plus percent. Massport, for this particular document, came up with a whole new way of measuring delay. So there seems to be a problem; has the problem been identified? What exactly is the rate of delay? There is nothing in the report that said what is an acceptable rate of delay. There's nothing in the report that says how many flights can this facility handle, period. What is the ultimate capacity of this facility? T1.7.2 T1.7.3

Because as it stands, if this were to be built, we'll all be back here in five

years saying, what are we going to do now? Additionally, there's an alternative, alternative 2, which is a no-build runway alternative, that actually in one of the scenarios presented in the report has a much better payoff for delay reduction if you buy the model that is put into the report.

So there seems to me to be a series of glaring inconsistencies in the report. There's some factual inconsistencies that need to be rectified. What is delay? The other problem in the report is, there's no discussion in the report as to the causes of delay. There are inferences, winds northwest direction 37 percent of the time; inference, 37 percent of delay is from northwest winds. No factual data to support that.

T1.7.4

For instance, if there's delay at an airport in New York, for example, or Newark, does that lead to delay at Logan? There is not a detailed discussion as to the total analysis of delay. What exactly are the causes of delay, and how much does this particular solution expect to diminish

overall?

It kind of reminds me of the story of somebody seeing a person sitting at a table drinking a diet Coke and thinking the diet Coke is the reason for putting on weight. There is just not a good connection here. The report is flawed, the discussion of delay is flawed, the planning process talks about regional approaches, but really doesn't get to some of the heart of the issue.

We would ask simply that Massport actually withdraw the report, the architecture, until there is a real analysis of the problem and we have a discussion of exactly how much of the delay problem can be reduced. Are we trying to get to zero tolerance on delay? Is that where we're going? Is FAA incorrect in saying there's only 3 percent delay? Who's correct? FAA helped sponsor this report.

Is FAA saying the DOT is correct about this issue and FAA is incorrect? These are the questions, and I would like Mr. Silva

to answer that actually, the FAA representative. Do we accept the FAA numbers or the DOT numbers for delay or the Massport numbers?

THE MODERATOR: That's an interesting question but we will save it for the final report.

MR. FONTANCELLA: And no one's going to comment on that?

THE MODERATOR: That's not the purpose for this hearing.

MR. FONTANCELLA: I know, but you did say you would allow some type of question be responded to.

THE MODERATOR: A question of clarification if what Mr. Silva said produced some ambiguity, then he clarify what he said.

MR. FONTANCELLA: No. The report produces ambiguity.

THE MODERATOR: The report has one measure of delay. That's not fair game for this meeting.

MR. FONTANCELLA: I didn't suspect it would be. Thank you.

THE MODERATOR: Does Mr. Cowin want to speak when we get to the individual speakers?

MR. COWIN: No, I don't. Thank you.

THE MODERATOR: Thank you very much. Now we're going to hear from Bernice Mader, and then following that we'll hear from Anastasia Lyman from the Citizens Advisory Committee.

MS. MADER: I am an elected official for the Norfolk-Plymouth County as democratic state committee woman, but I'm also speaking here as someone who formerly was a member of the Community Advisory Committee to Massport and the city of Quincy's representative for 19 years to the CAC, so in those capacities what I would like to do is to present the Community Advisory Committee's response to what Betty Desrosiers, the director of aviation, earlier presented to you. T1.8

First, we believe that Massport has violated both the spirit and the regulations T1.8.1

of the EPA, MEPA, and the FAA, as well as a sense of fair play and environmental justice. Now, the NEPA and MEPA process, when it's used in an honest fashion, can be a very helpful learning tool, but in this case, Massport has tried to twist the way it can be used, we believe, in an unfair fashion, and instead, in trying to reach a consensus with the diverse cross section of groups, it's causing conflict instead. T1.8.1 (cont.)

Massport has used outdated and worst case scenario data which I'll speak to very briefly later. T1.8.2 One of the things that Massport never does in its study is it never examines Logan Airport itself as it is right now. They talk extensively about delays, but they never really mention what the major problem and the real problem is at the airport, and that is the size of the airport. T1.8.3

A newly-created international airport based on the minimally-acceptable federal standards would be at minimum about 5,000 acres, and many would be 10,000 or more such as Dallas or Denver or some of the

others that have been built in the last couple of years.

If you look at that in contrast, Logan International Airport is only 48 percent of the minimum size that you would need to start to develop an airport, and it doesn't work. No major physical improvements have been made to Logan since 1977 until this past year when they opened the parking garage. To allow an international airport to be able to continue even to operate in this atmosphere, Massport has stretched every possible system that exists at the airport to its limit and beyond its limit.

Anyway, no 5,000-foot unidirectional commuter runway can address Logan Airport's overwhelming shortcomings. It just doesn't have any more room to grow and that's what the problem happens to be. Now, parking, ground access, pedestrian access, the parking lots, the off-site cargo terminals, the relocated fuel line, the outrageously difficult sign system are now all to their extreme limits, just postage

T1.8.3 (cont.)

stamp size.

A major commercial airport is now trying to squeeze another runway in to accommodate its basic lack of adequacy. Not only is Massport's study inadequate, so is the airport. The growth of the commercial passenger industry over the past two decades has outstripped Logan Airport. In the site where it currently is located, it is out of space, it is out of time, and it's out of capacity.

Now, a large number of cities both in this nation and across the rest of the world have observed the trends in aviation growth and they planned for it. Massport didn't. They conducted studies but studies aren't plans, and what they refer to as studies, they really didn't come out with any kind of a comprehensive master planning aviation approach to the Massachusetts plan. I understand regionalism and I am a strong supporter of regionalism, but they have not come up with a Massachusetts plan, and that has not worked.

Instead, what they did was a series of stopgap measures to patch its inadequate infrastructure system. Massport continues to provide for 20 pounds of power inside a five-pound bag. It doesn't work. If you read the EIR, Massport has not at all, and it's inadequately addressing the whole section regarding alternatives and the way they looked at them. T1.8.4

I'm not going to cite the sections within the MEPA regulations except to tell you when their consideration of alternatives is just so inadequate I don't know how else to express it. To dismiss Hanscom Field in two-and-a-half paragraphs, video teleconferencing in three paragraphs, and the north-south rail link, the Portland rail link, the northeast corridor improvement in three paragraphs? I think there's certainly short shrift. They have not done any serious commitment to looking at real alternatives.

Instead, Massport wanted the shoe to fit no matter how they've got to cram the foot into the glass slipper. Anyway, again,

I address to you that there is total inadequacy in the way they examined alternatives. Instead, it needs to be redone, withdrawn and redone.

Now, Executive Director Blute has made dozens, in fact many more than I even thought, according to Betty Desrosiers, maybe almost a hundred presentations to the state's delegations, to private companies, a variety of chambers of commerce, many large business councils, tech. councils, associated industries, New England Council, and so forth.

At that time, though, Mr. Blute, when he very first was appointed he appeared before the anti-review committee and he made commitments to the folks at that time saying that, as the new person he would step back and examine all the alternatives that had been proposed and he would get back to us with what he called a neutral and objective analysis.

Let me tell you something. Within less than a couple of months after Mr. Blute

made that statement, he had already been to Washington, D.C. to lobby Massachusetts federal congressional delegations to be in support of the runway, and he also already addressed East Boston Chamber of Commerce. This is from a person who said, I will neutrally examine the choices.

In addition, he did not acknowledge the form that his predecessor, Stephen Tocco, as the executive director of Massport that invested in what's called the air side review committee. That's the committee that former director Tocco had appointed which was composed half of the community advisory committee to Massport. That is composed of 24 citizens who are appointed by their neighbors or boards of selectmen, and one-half the other recipe represented by airline companies, airline agencies, or business interests.

That particular group, the air side review committee, was supposed to take the information that the Massport consultants presented, they were supposed to listen to

each other's questions in each other's presence, and comment on the Massport team's data. Everybody went into that process for many, many meetings with a sincere approach to it.

But what happened is all of a sudden, once Governor Weld left, there was an 18-month hiatus. All of a sudden, no reason given, the study was withdrawn, all work had stopped. We have been driven like galley slaves to meet, meet, meet, meet, meet. Boom, all of a sudden, no explanation, nothing. Everything stops dead. Instead, every time that I, and later on Anastasia will tell you, would make a phone call to Massport, and we were told that Mr. Blue was examining alternatives.

Let me tell you, we citizens knew different. Instead, we knew he was lobbying everybody else, as I said. Instead, what he did was he went into a variety of communities and he spoke to uninitiated citizen and business groups, and they neither had the background, the history, or the information

to ask him the pointed and probing questions that should have been asked of him. It was much easier for him to do that.

So we were told at that time that nothing much was going on during that 18 months. Massport consultants were gathering data, they were working on things. That would be about as specific an answer as anybody would get when we would say, what's happening in these 18 months. Then all of a sudden, the state elections happen and, what do you know, within about 10 or 12 days after that, wouldn't you know the process started up again.

And, as a matter of fact, we weren't even formally notified about what was happening behind our backs, which was the consultants were working again, they were generating some new information, things were going along. What happened? The holidays came and went, Thanksgiving, Christmas, New Year's. Anastasia Lyman got a phone call. The phone call said, guess what? We want to schedule one more ARC meeting in about a

week. That was about the notice. We're going to have one last one and we're going to ask you to sign off on it.

Now, if you've seen the document, I've never weighed it or measured it, but we say if it could be done, so I imagine it weighs maybe, I don't know, 15 pounds, and I don't know how many inches' worth of text. They were going to get that information to citizens and to our consultants the day before we were supposed to, quote, sign off on this.

Anyway, the ARC members were outraged and rightfully so. Over and over, we're told, trust Massport Authority. With that use of process, would you trust Massport Authority for using those kind of tactics? Anyway, all I'm going to say to you about delays, they used the year 1993, and Phil Lemnios raised a very good point about it. The year 1993 was an aberrant year for Massport. In fact, it was the single worst year they've ever had for delays, and nothing else has approached that since then.

T1.8.2 (cont.)

As a matter of fact, I wanted to know what else happened that year so I went to the U.S. Weather Bureau Information Service and I looked in and I found if I looked at the weather of 1993 and 1994, it had a record snowfall, 96.3 inches. It broke all records. So when they figure out the delays, as Phil Lemnios from Hull already pointed out to you, they never say to you, well, you know, if we got a foot-and-a-half of snow, even if we had 67 runways, we still would have closed down because we couldn't stay open.

MR. MODERATOR: Would you please wrap it up?

MS. MADER: I'm going to try as fast as I can. One of the other things I want to introduce which is a new concept is the concept of the interruption and delay factor. I have copies of this if people need it later. As they continued to talk about their 313 million dollars in loss due to delay, it occurred to me one day when a plane would have to stop right over my head where I

work and I had to wait until it went over.

I said, you know, that's a cost to me and my job and I wonder how many more me's are out there sitting listening to this airplane noise. So I decided to try and make up my own model of how that might work. I mean, Massport did so why can't I? As a matter of fact, what I did is I copied their exact same methodology. The way they count the delays, they didn't do it the way the FAA does.

What I did was this. In 1998, there were 483,000 flights from Logan. That's takeoffs and landings. That went over 19 Boston neighborhoods and 18 affected communities. If you totaled everybody up who lived under those, that's a million in the number of people who lived under that. Then if you take the figure which would be approved by the board and the Department of Labor, 62 percent of those people actually could work.

If you took the average income from the city of Boston, which is 37,750 average

annual income for people, that would come to about $18.00 an hour. However, I said, well, let me be extremely conservative and use $7.00 an hour, the lowest minimum wage that people might use, and I used the following example. If every one of you or us were in that area under those flight paths and not everybody gets the noise every day, and I'm willing to concede that, so I said maybe about one-third of the people three days a week each of the days, maybe six hours. You don't get it 24, but six hours.

What if you got five minutes of interruptions only for each of those six hours times three days? The long and short of it is at $7.00 an hour, that came to 11 million dollars a week, plus or minus. It came to 575 million dollars. If I took the probably more appropriate figure of what the real pay is for people at the time, businesses want to know what you're losing? If I really use the $18.00 per hour, what it came out to be, believe it or not, across one year was 1.5 billion, B, billion dollars.

THE MODERATOR: Thank you very much, Ms. Mader. I would ask you to sit down so we can move on to the next speaker. Next we'll hear from Anastasia Lyman. Ms. Lyman will be the last of the government officials to speak, and I'll let you speak until 8 o'clock and then we'll take a five-minute break. How's that?

MS. LYMAN: Thank you. I want to than you for allowing me to speak tonight. I am the co-chair of the Community Advisory Committee to Massport along with my other co-chair Sandra Coates from Braintree. The Community Advisory Committee represents 25 environmentally-impacted neighborhoods and communities surrounding Logan Airport. We were established in 1978 and we have been working with Massport on Logan-related issues ever since.

I am here this evening to submit to you the written document of our consultants on their findings on the draft environmental impact statement. The CAC concurs with their findings wholeheartedly. I will not go

through them. I'm sure other people will be mentioning most of them this evening.

Because I'm submitting the written document, all I can say is that they have found and we concur there are substantial planning deficiencies and omissions in this document. We ask your agency to find that this document is inadequate, and we ask your agency to require that a new one be done based on the findings in this report. Thank you very much.

THE MODERATOR: Are there any other elected officials or government officials that would like to speak at this time before we move into the individuals? Seeing none, we'll take a five-minute break and reconvene at 8 o'clock.

(Brief recess taken.)

THE MODERATOR: We're going to go back on the record now. As I said before, we're going to start by alternating people who oppose the project versus people who support the project. I'm going to ask you to keep your comments to three minutes, and I

will give you a gentle reminder then. We graciously allowed the elected officials and government officials a little bit more time, but I will try to keep us to our timetable now because we have several people who want to speak.

Again, I remind you that if you want to be heard by the media, use the microphone on my left, your right. If you don't care whether the media hears you or not, use the microphone in the center. I will call two people, two supporters and two opponents, so you'll know who follows whom. We will first hear from David Graham of the Aero Club of New England, followed by David Osborn of Winthrop, and then Christopher Good, Massachusetts Business Round Table, followed by Christopher Blackler from East Boston. Mr. Graham.

MR. GRAHAM: Thank you, Mr. Chairman. For the record, my name is David W. Graham, G-R-A-H-A-M. My comments are being submitted to John Silva in letter form. Dear Mr. Silva: My name is David W. Graham.

T1.9

I am the secretary of the Aero Club of New England and have been so for 30-plus years. It is our opinion that Boston Logan Airport desperately needs runway 14/32. T1.9.1

Here's why. Under normal circumstances, Boston has operated at least a two-runway configuration and often three which allows a fixed number of hourly operations to occur. This number is dramatically reduced with strong northwesterly winds either following a storm or a cold frontal passage.

When these weather phenomenon occur, the airport can be brought to its knees as there is currently but one runway facing into the northwest, and as we all know, aircraft must land into the wind when it exceeds a fairly low limit. The addition of runway 14/32 would accomplish two items. First, it would allow the airport to maintain a two-runway configuration for arrivals much as it normally does during light wind conditions or where the winds are in northern directions.

The second item runway 14/32 would do is provide relief by permitting additional departures over Boston outer harbor and Massachusetts Bay, thereby providing a dramatic reduction in lower altitudes over flights above neighboring communities. The simple fact remains that runway 14/32 would produce not one flight over the residential dwellings or industrial structures.

Furthermore, the assumption that runway 14/32 would only add more flights is categorically incorrect. Indeed, the addition of a one-direction runway 14/32 would only assure that the current level of two-runway configurations is maintained under all wind conditions.

A few years ago, the Massachusetts Aeronautics Commission held a hearing at Florian Hall in Dorchester. The resident attendees that evening were demanding to know why there was hesitancy in the implementation of runway 14/32 at Boston Logan Airport. At that time, there was no easy answer. Now, there is a resolution readily at hand for

that all-important question.

While it is true that there has been a slight reduction in flight operations at Boston Logan Airport since 1993, this has come about due to the fact that Manchester and Providence Airports have become on-line since then and have accomplished exactly what they were intended to do. However, transportation planners must take into consideration the worst case scenario available to it.

THE MODERATOR: Try to wrap it up, please, Mr. Graham.

MR. GRAHAM: Planning for the numbers to increase at Boston Logan Airport, which they will do, only addresses the need for runway 14/32. Boston continuously strives to increase its effectiveness to the traveling public, it's attractiveness to the traveling public, and you can see examples of that each and every day.

While the implementation of runway 14/32 at Boston Logan Airport is not the end-all towards that goal, the runway will

clearly benefit Boston's economy and will play a strong role in the region's overall transportation infrastructure. In short, Boston needs its airport, and the airport desperately needs its final runway, runway 14/32. Thank you very much.

THE MODERATOR: Thank you, Mr. Graham. Now Mr. David Osborn from Winthrop.

T1.10

MR. OSBORN: My name is David Osborn. I'm from Winthrop, Massachusetts. I'm an expert insofar as the last two decades I've lived on the water at 22 left and have watched it. As a taxpayer, I recall that a valuable piece of land like Massport has in Hanscom is running at a loss of more than 2 million dollars a year.

I'm concerned that Massport has never provided a model that could calculate or measure the anger and the fury of all of its abutters. I am also appalled that they take credit for relocating the sandpiper for, in fact, the sandpiper is our last bird. It's the last one we have. Anyone driving around East Boston, Winthrop, Chelsea, Revere

has to acknowledge that. There aren't too many birds left.

One flight per minute, one flight or takeoff per minute per hour for 16 hours a day every day of the year for life, that is what we have at 500,000 flights and takeoffs a year. That is what we have. It's growing. With another runway, it's going to increase exponentially probably 4, 5, 6 percent a year. It's going to be ridiculous.

I took information -- I could not have hoped for a better opening act than Mr. Graham on the northwest winds at Logan. I went to the Boston Public Library on the northwest wind issue, and let me run this through you. One hundred and forty-five days there were winds over 17 miles per hour in 1998 for the whole year. Fifty-six of those days were from the northwest. That's 15 percent of all annual flight time.

Of those 56 days, 24 days fell on Fridays, Saturdays, and Sundays. Those are the peak flying periods. Everybody knows that. Twenty-four days in the year. Now, of

those 24 days, there were 10 days that had constant wind problems between 17 and 29 miles per hour. That's less than one per montn from the northwest that Massport is claiming is really making a deep impact and why their delays are so high.

Now, that represents -- the 24 peak days, the 10 peak days, represent 3 1/2 percent of all flights and landings taking off. They're still taking off so half that is 1.75 percent. That's all they can improve upon with a new runway, 1 to 2 percent.

THE MODERATOR: Try to wrap it up, please.

MR. OSBORN: I went to the state transportation meeting and I was not allowed to speak. I am the most effected of all. I only need an extra minute. I really beg your indulgence. It's not much more than a minute. The distribution of wind theory, if I give Governor Cellucci half of my problems in Hudson so that I have half less, that's not a solution. You're giving more to some, taking away from others. That's just the

T1.10.1

same thing. More people are hurt. That's not distribution.

Where are the 2 1/2 million pounds of pollutants, emissions, toxins going that these aircraft put out into the air every single year? To what extent has Massport played a part in the pollution of Boston Harbor? No one knows. To what extent have they played a part in the chemical de-icing facilities that have been ongoing for decades; where does that go? Is that FAA-controlled? No one knows. T1.10.2 T1.10.3

If no one knows, why are we going forward with this EIR or whatever it is? No one knows. They have not provided any information. People are detached from this problem. They do not understand one flight per minute every year or whatever, and I'm going to give one more thing. I'm going to ask --

THE MODERATOR: You've already used your minute so I'm going to ask you to sit down.

MR. OSBORN: I just need one

minute.

THE MODERATOR: I'm going to ask you to sit down now. We really have to move along.

MR. OSBORN: One hundred and eighty flights in the air at one time is like this, one, two, three, four, five, six, seven, eight, nine, ten, 11, 12, 13, 14, 15. Those are planes with passengers.

THE MODERATOR: Thank you very much.

MR. OSBORN: Count to 180.

THE MODERATOR: Thank you very much, Mr. Osborn. I'm going to ask you to sit down.

MR. OSBORN: And add on another one every minute or every 30 seconds. That's safety FAA, that is safety. Thank you.

THE MODERATOR: The next speaker will be Christopher Good of the Massachusetts Round Table, followed by Christopher Blackler of East Boston, and then Christopher Anderson from the Massachusetts High Technology Council.

T1.11

MR. GOOD: Thank you. My name is Christopher Good, director of public policy for the Massachusetts Business Round Table, a state-wide organization with 75 Massachusetts leading chief executives. The round table's board of directors has voted unanimously to strongly support the opening of runway 14/32 and creation of the new taxiway at Logan Airport.

Over the last decade, the governor and the legislature accomplished a great deal to improve the ability of Massachusetts businesses to grow, to gain jobs, and compete with companies based in other states and around the world. However, there remain many factors that can impede job creation and continued growth of our economy such as the excessive and costly number of delays at Logan Airport.

The ability of Massachusetts businesses to expand and create jobs in good times and in bad depends on their ability to move employees, customers, and goods into and out of Massachusetts in a timely and

predictable manner. The efficient use of Logan's existing capacity with this runway and taxiway in coordination with a greater use of Worcester, Manchester, and T.F. Green Airports will allow our businesses to continue to create jobs here in Massachusetts and to compete nationally and around the world.

For reasons of job creation, competitiveness, quality of life, and economic growth, the Massachusetts Business Round Table strongly supports the opening of runway 14/32 and the creation of the new taxiway. Thank you. T1.11.1

THE MODERATOR: Thank you. Now Christopher Blackler from East Boston. The next opponent will be Arthur Harnet from South Boston.

MR. BLACKLER: My name is Christopher Blackler, B-L-A-C-K-L-E-R. I am not only part of the Neighborhood Association but I'm also part of a layman's council, and what I want to say is I live in an alleyway which is 2 Webster Ave., and I've been T1.12

hearing a lot of noise over my head every night, and the more noise that occurs, I can never sleep.

And also, I have asthma sometimes, but if it kicks up, it would also be because of toxins in the air. And I go to work every day usually breathing in more than polluted air. See, if I keep breathing in, I could become sick and I will not be able to work, and I wish Massport, you know, would reconsider building runway 14/32 because I do, in fact, oppose the runway.

The other thing is if you go back and look over the data again, they should have added something that should say about the air quality because if they don't do that, I will never get enough information to look at. That's all I've got to say. T1.12.1

THE MODERATOR: Next we'll hear from Christopher Anderson from the Massachusetts High Technology Council. The next supporter will be Albert Sherman from Arthur D. Little. Mr. Anderson.

MR. ANDERSON: Good evening. Thank T1.13

you for the opportunity. My name is Christopher Anderson, vice president and general counsel to the Massachusetts High Technology Council. Recognizing that Logan International Airport is vital to the entire New England region's economic interests, the high tech. council vigorously supports the well-thought out Massport Authority's proposal to reduce delays at Logan Airport. T1.13.1

We do this in the context of the regional transportation solution system, that it does incorporate the obvious increases in passenger use at Manchester and Green and, in fact, I personally have bailed out of Logan Airport now on trips to Chicago in favor of Manchester.

There are many legitimate and substantive anecdotal reasons probably that you've heard more of on the opponents' side particularly from those affected communities that are, in fact, important. However, we urge you to look at the report, the well-thought-out report, and its substantive contents.

Preventable delays at Logan impact negatively on where high tech. companies expand or locate, and the mobility of our high tech. economy can result in a quick relocation out of the region quicker than it took the New England Patriots to decide to move to Hartford.

Critical for Massachusetts global high tech. economy are the improvements proposed at Logan. In addition to shifting the noise burden from some of the hardest-hit communities, the new runway would reduce delays while not changing Massport's limit of 120 aircraft operations per hour set by the FAA.

The additional lost productivity caused by delays on beautiful blue sky conditions when the wind is out of the northwest, even if it only affects a percent or so, has a dramatic impact on the ability of our high technology companies to reach their customers and their vendors and vice-versa.

We support the improvements. We

hope they are approved forthwith. The High Technology Council consists of more than 180 chief executive officers of Massachusetts high technology companies and highly-valued service employers. Thank you.

THE MODERATOR: Thank you, Mr. Anderson. Now Mr. Arthur Hartnet from South Boston. The next opponent will be Ron Whalen from Winthrop.

MR. HARTNET: Thank you. I would like to address the number of hours of delays that have been presented to you tonight as 121,000 hours of delay from Massport's modeling. It is not supported by the FAA's own figures. You have to wonder about the 121,000 hours. T1.14 T1.14.1

The regional airport scheme, of course, is a great thing, but I don't think that the number of operations in all of the regional airports will ever equal what we have today at Logan Airport that are affecting the health and welfare of all of the citizens that surround the airport. It's a very congested city we live in. The

regional concept, of course, would help the high tech. industry by not having all of our eggs in one basket, so to speak. Think about that, high techies.

Within the ten-year period, the number of hours of delay, the number of hours of delay, not the percentage, I want to talk about number of hours, will overwhelm this airport and will be exceeding what Massport is predicting we have today of 121,000 hours. T1.14.2

Also, if this runway is built, runway 27 will see a dramatic increase in the number of operations. Runway 27, a federal EIS was conducted on this runway and concluded in 1996 and the flight of the departures, and just departures off runway 27, still to this day are not what the people that conducted this EIS desired, and they're still working on this and it's not working. Runway 27, which will see a four-fold increase in just departures when runway 14/32 is built is not working for jet departures, is impacting more people today than it ever impacted before. T1.14.3

We also had presented to us the fact that this runway will help Massport or the FAA, whichever one of those is the guilty party, achieve the PRAS goals. Well, PRAS goals have been put on the table for a good number of years and have been ignored. I don't know why all of a sudden we're looking at them. It would be nice if they were achievable but I think that with the number of operations that are coming into this airport and the excessive number of operations that are coming into this airport, PRAS goals as they were designed in the early '70s will never be achieved, ever. T1.14.4

Another item that I would like you to consider is your center field taxiway. We're building a center field taxiway and at the same time we're saying, well, if we built 14/32 we'll be able to relieve the air traffic off the north-south people, that's baloney, because the center field taxiway is going to be a conduser to have more operations on the north-south runways because you're going to be able to get the aircraft T1.14.5

off and on to these runways in a much quicker fashion.

I would just like you to mull over those points. And again, like I say to the high tech. and the high business people out there, more airports would be more beneficial, more regional airports with a greater number of operations so that there was a more equitable and environmentally-justifiable operation. Thank you. T1.14.6

THE MODERATOR: Thank you. Now we'll hear from Albert Sherman.

MR. SHERMAN: My name is Albert Sherman. I'm senior vice president of Arthur D. Little. Arthur D. Little is a firm that was founded 115 years ago, and we are located right here in the Boston area and are something of an institution in this town. We were here before Logan Airport existed. In fact, we were here before air travel existed. T1.15

We were at that time very fortunate to serve a local business clientele because in those days that was the way you did business, but as the city of Boston has

prospered and become a world-class city, we, in turn, have prospered and become a world-class consulting firm. We find that we are inextricably tied and dependent upon access to efficient, safe, reliable, and timely air service.

I'm here today just to make a few comments about what it's like to be involved in that kind of a business. I'm not here to debate or argue the very well thought out thoughts of those who spoke in favor of this and those who apparently are in opposition. It's just to share with you what it's like to be in a business that's so dependent upon air travel.

As I mentioned, we serve a national and international clientele and we spend a lot of time in the air. The way the Logan situation affects us is how it is that we plan our business, and the compromising that we increasingly have to make because of the delays, not only the actual delays but the contingency you have to build into your planning because of the possibility of

delays.

There's no way to measure the cost of disciplining a client by not making a meeting or of having to cancel a meeting or for the substantial inconvenience caused when they come to visit us and are unable to arrive at our facility. We do everything that we can to deal with that.

I am a user and have used the Providence airport, I take the train to New York when I can. I'll be using Bangor tomorrow, and for the first time I'll be using Manchester next month. I support those people who have argued for regional solutions. I think all of these things are necessary in order to make for a more prosperous local economy. T1.15.1

Just on a personal anecdotal note, I don't know how much of those 121,000 hours personally according to your model, but it must be a lot of them. I wasn't here in 1993 so I don't have data and I'm not comparing it to that, but I do know that it affects me personally in terms of how I plan my day and

my business.

So I'll just share with you that right now as part of my business planning with my colleagues, I am seriously considering locating out of the Boston area. You shouldn't be concerned, that's not the basis upon which you will make this decision, but I think it's an anecdote more broadly shared than I can imagine. It certainly affects growth at the margin, not so much where you locate facilities and people that are already there, but those at the margin that are yet to come.

It's becoming difficult to serve that national marketplace and I may need to relocate. I hope that Boston will continue to prosper and thrive. I don't know that Logan is the only answer. There are many other regional answers, but I encourage you to seriously consider the proposal in front of you for expansion, the addition of the runway, and to accommodate as reasonably as you can within that plan the very considered and thoughtful views of some of the opponents

who would like to see their considerations met as well. Thank you very much.

THE MODERATOR: Thank you, Mr. Sherman. Now we'll hear from Ron Whalen from Winthrop, and then the next opponent up will be Elaine McGrath from Chelsea.

T1.16

MR. WHALEN: First of all, I want to say that I appreciate the previous speaker's comments, the one that communicated that he is planning on using Manchester Airport. We appreciate that, and the fact that he indicated that we should consider our solutions as well; namely, regional transportation.

My name is Ron Whalen. I'd like to say that I'm from the Massport colony of Winthrop. I should say from the historic Massport colony of Winthrop. That was among the first communities to drive colonialism out of America, and that's what we're trying to do a little bit of that again here with Massport.

I think if you study colonialism and you study Massport and our relationship

with them in Winthrop, it feels a lot like the old days. I am a resident and homeowner in Winthrop, and I'm here at this Massport hearing, which to me is an oxymoron, to testify that the people of Winthrop, those who live in the communities adjacent to Logan Airport, have reached, indeed exceeded, the limits of toleration as far as Massport expansion is concerned.

Massport may not admit to the fact that Logan is at capacity, but I'm here to tell you this evening that as far as we, the residents, are concerned, we feel that Massport has far exceeded its capacity. The rallies that you have heard about, the resolutions, the writings, the recitations that you have seen, I think are but a harbinger of what you are going to see if Massport doesn't really put a stake in this proposal and start thinking about other solutions. T1.16.1

I am in Winthrop. I live in that 65 decibel area where we receive what you call mitigation windows, and I want to

mention that tonight because I want to make it very clear to the people in the Environmental Protection Agency that we consider those mitigation windows as nothing more than preemptive damages for taking away our outside, for making us prisoners in our own homes.

If those windows were tea bags, we'd be throwing them in the harbor. We really don't need and won't accept and we won't tolerate any further mitigation. Tonight I was very struck by the fact that this is an environmental impact hearing. We're here to comment on environmental issues. I have been at a number of meetings, I've been at the state house, and I've listened to the proponents of that runway, and it's embarrassingly silent, and I'd like you to sort of contemplate the silence from the business community when it comes to quality of life issues.

You'll notice when Massport got up, they start out immediately talking about the business context. When the business

community gets up, all they're talking about is the business interest. There's not even an attempt that I have seen for them to talk about quality of life issues within the neighborhoods of Boston, and that's what this hearing is all about.

THE MODERATOR: Try to wrap it up, please.

MR. WHALEN: I would like to ask you to put a stake in this proposal so that we can cause Massport, we can cause the government, cause the state to exert their energies in finding real solutions. We have ideas. We want to work with Paul Guzzi, we want to work with the round table, we want to work with the business communities in achieving real answers to Massachusetts air transportation policies, so let's not delay this. Let's kill this thing, the people want it dead, and let's move on to real solutions. Thank you.

THE MODERATOR: Next we'll hear from Kevin Cohen from the South Shore Chamber of Commerce, and the next supporter after Mr.

Cohen will be Jay Cortell from Boston.

MR. COHEN: Thank you very much. T1.17
My name is Kevin Cohen. I'm the affairs manager of the South Shore Chamber of Commerce which has 2500 members on the South Shore and it's based out of Quincy. First of all, I'd like to address a couple of misconceptions that have been repeatedly printed in the media and also relayed by a lot of people, supporters and opponents, actually.

First of all, that this is an expansion plan. It is not. Massport right now is limited to 120 flight operations per hour. If you build 14/32 or you do not build 14/32, it's still limited to 120 flight operations per hour.

The second misconception is that somehow 14/32 and the taxiway is a regional plan. It isn't. Massport has never presented it as a regional plan. They didn't present it to the South Shore Chamber of Commerce as a regional plan. This proposal addresses a wind problem and inefficiency

problems on the air side of Logan Airport, and that's why this proposal is here and before you. It shouldn't get caught up with some great answer to all the regional transportation problems that we have in this region and we do have a lot.

The appropriate authorities, some of you people here tonight but also the commonwealth of Massachusetts and the federal government, should be, and in many cases are, addressing those regional problems, whether they're addressing it through high-speed rail, commuter rail, also through the tremendous growth we've seen at Manchester, New Hampshire and Green in Rhode Island. T1.17.1

Also, the commonwealth of Massachusetts is proposing expanding Route 3 North that goes from 128 to the New Hampshire border, and they're proposing a unirail service from Massachusetts to Green Airport in Rhode Island. Also, the state did take many years and spent a lot of money to make a proposal for a second major airport. It was considered and it failed.

The real fact of the matter is, if you can't build a 5,000-foot small aircraft runway, there is no way in the world we're going to be able to build another international airport. It just can't happen. So we look at issues like 14/32, we look at an efficient way in which Logan Airport can be run, and that's why we support 14/32.

The last issues I want to address are the environmental concerns. Basically with this proposal, less delays equals less environmental damage. A plane that lands or takes off on time does not add avoidable pollution because they do not sit on the runway while waiting to take off, or they do not circle the city waiting to land. T1.17.2

Also, the noise pollution that's happened to a lot of these communities is going to be more equally distributed, and many of those flights will be pushed over the water. T1.17.3 This proposal before you is a pro-environment proposal. If 14/32 and the taxiway is built, the environment in and around Logan Airport will be better for us.

I think we should use the five to ten-year window of opportunity we have before the flights become overburdensome again to go even further to address these regional issues, but that is a responsibility of the commonwealth of Massachusetts and the federal government along with Massport or to direct Massport to address those opportunities.

I'm concerned that we're going to miss an opportunity here to make Logan run better, but also to address the larger regional problems. The opponents are being very narrow in their focus of just beating 14/32, and they think somehow that addresses those regional problems. It doesn't. We have to do it in addition to building 14/32 and the efficiency of the runway. Thank you very much.

THE MODERATOR: Next up will be Elaine McGrath, and the next supporter will be Raol Murrow. Mrs. McGrath.

T1.18

MS. McGRATH: Thank you. For those of you who haven't seen it, this is the Massport proposal. I've read it. My name is

Elaine McGrath, M-C-G-R-A-T-H. I live in Chelsea. Betty Desrosiers suggested that runway 14/32 and all the other parts of this proposal are the missing piece of the puzzle. What she didn't say is there's lots missing from this proposal.

This draft EIS is inconsistent with both the letter and the spirit of the Environmental Policy Act. In fact, it has failed to comply with MEPA. MEPA requires agencies to consider environmental consequences, to take a hard look at them, and to take a hard look at alternatives, and to make that information available to the public. T1.18.1

I live in Chelsea next to the airport overlay district. We are not within the noise contour map, but we live under a blitzkrieg. Here is a statistic for you. Massport says the problem is delays, the sixth-most delay-prone airport in the country. In 1993, the FAA said Logan was the sixth noisiest airport in the country. Where is that in this report? T1.18.2

Three critical flaws, I believe there are at least three critical flaws in this proposal. First, the information on environmental impact fails to assess those impacts adequately or accurately because the modeling is flawed and Massport knows this. T1.18.3

The monitoring of those impacts is also inadequate and Massport knows this but you do not because it's not reflected in here. The communities will know this. What this means is that this report does not do what MEPA requires Massport to do. It does not capture the reality of current environmental impacts.

This is about Massport's manifest destiny, but for people who live in the communities, it cannot be about that. It can't be about that for you. There are two other critical flaws that flow from the fact that their modeling and their monitoring are seriously flawed.

The second critical flaw, the alternatives are straw men, but communities, I understand that they have to do under MEPA T1.18.4

a no-action alternative. That is not an alternative for the communities. At 115 flights an hour right now, short of the 120 capacity, the communities are speaking with one voice and they're telling you it's unbearable. At 115, it's unbearable, and we've told Massport that and Massport has not told you that.

They are supposed to thoroughly evaluate all reasonable alternatives, but again, the assessment of the impact of those alternatives is flawed because their data is flawed, their models are flawed, and their monitoring is flawed.

Finally, and the last critical flaw I want to point out, the environmental justice analysis. Again, it's unreliable because it flows from faulty data. First, the impact analysis. T1.18.5

THE MODERATOR: Try to wrap it up, please.

MS. McGRATH: You have an obligation to assess real impacts of current operations and alternatives. In 1993, there

were 493,000 operations. In 1998, there were 507,000, and yet Massport says the noise impact decreased because of the stage 3 aircraft.

What they don't tell you here but they tell you in the GEIS is that on landing and takeoff, stage 3 aircraft are noisy and that cannot be remedied, and these communities have to live with landing and takeoff. T1.18.6

Why have they failed to represent the impact? They know about the community protest. They know that the noise contour does not capture the noise. They have admitted before the Chelsea City Council that although we're not within the 65 DBL noise contour that, in fact, we experience those impacts.

Their monitoring in Chelsea, the one noise monitor was out of commission for two years. You won't see that in here. What does that do to the accuracy of the environmental impact data? Their modeling is therefore unreliable. It's state of the art T1.18.7

but it does not capture reality and they know it. The monitoring is problematic.

There are other statistics in here. You'll see them. I'll just point out one page, Page 5-29, involving one about how they assessed a certain impact and they had to revisit it because more people were affected at higher levels. There's basic flaws in their data. What you've really got is a degradation of the human environment in these areas.

They're noisy, they're dirty, they're a danger, and they're ugly because of Massport operations. We need an informed environmental consideration under MEPA. How are we going to get it? This is the fox saying the chickens appear to be okay. We need EPA site visits. We need a state board of health involvement to assess air and noise monitoring. We can't do it. The communities cannot do it. We need your help. We need an independent competent assessment of these impacts. We need a supplemented EIS. The second critical flaw --

THE MODERATOR: I think I'll have to ask you to sit down.

MS. McGRATH: Could I please just have two minutes?

THE MODERATOR: I think you've made your points quite adequately, and I would ask you to sit down so we can move on. Now we'll hear from Raol Murrow from the Aircraft Owners and Pilots Association, followed by Mary Quinn of Chelsea, and then followed by Thomas Kershaw.

T1.19

MR. MURROW: My name is Raol Murrow. I'm the northeastern regional representative for the Aircraft Owners and Pilots Association. We broadly represent general aviation, and general aviation is all aviation except military flying and the scheduled airlines.

Our official position has been presented in a letter to you and I'm not going to read it to you or repeat its content. It pretty much reflects what the study revealed and what we studied over the last several years in the air side review

committee.

What I would like to do instead is to summarize some of my own personal experience and observations with respect to this process and the study. The fact is --

THE MODERATOR: Excuse me a second, Mr. Murrow. People in the back are carrying on a conversation. It's very difficult to hear up here. Please give Mr. Murrow your attention or leave the room. Thank you.

MR. MURROW: We have monitored or participated in many of the studies mentioned here starting with the second major airport study, the strategic assessment review, the New England transportation initiative, the capacity task force which looked very carefully and analyzed the various kinds of configurations at Logan and came up with the idea of the unidirectional runway would solve the problems without causing the environmental problems that the community was concerned about regarding runway 14/32 in the past. T1.19.1

There is really no surprise. Why

does general aviation care about this issue? We are a minority user of Logan Airport. Fewer than one out of 20 aircraft historically use it. We often go in on little runway 15/33 right which doesn't impact the runway at all, so it seems strange that we would comment, but it's because we understand a couple of major facts.

One of them is that this is a regional issue and really a national issue in terms of its impacts on your transportation system. Airports do not exist by themselves. They are part of a system, and this airport impacts airports all across the country when there are problems. When delays occur, aircraft sit on the ground elsewhere. Flight crews are delayed, passengers are delayed.

We, as general aviation users, are also airline users, airline passengers, residents of the community, and we are likewise impacted whenever we are delayed. This causes waste of fuel, equipment, and human resources, and I say, it compromises the ability of the aircraft to control system

which affects airports everywhere.

We also are sitting in an airport somewhere when we are delayed by problems at Logan Airport and cannot join our families for dinner as well. Some critics say, don't fix it. Computers will eliminate the need for air transportation. And I say, and I think the statistics show, that computers are going to eliminate need for air and other travel the same way they eliminate the need for paper.

We are basing a continuing and increasing need and a special need in an area so dependent upon such a high technology industry and consulting services as Boston, a real leader in terms of the intellectual capital, we really need to think about making our transportation efficient. The world depends upon it.

And my final comment, the purpose of this plan is to reduce delays, to get folks home earlier, to reduce late-night flights which negatively impact the community, and to put many more of those

flights over water. I'm sad that the MEPA has somehow or other degenerated into accusations and, I think, an awful lot of inadequate information going around.

I hope eventually the truth of the conclusions that we all really studied for a long time to get eventually do become accepted and embraced by the communities that we wish to serve. Thank you very much for the opportunity to give my comments.

THE MODERATOR: Thank you very much. Ms. Quinn, and the next opponent will be William Falcetano from Somerville.

MS. QUINN: I'm Mary Quinn. I live on the Chelsea waterfront, and I too sit in airports but that's only because it's quieter than in my home. The runways, actually if you sit in the terminal in the airport, are further away than they are from some of the homes. T1.20

What I want to talk about is the data that's in this report. As I understand it, the data that is given to you should represent the reality of the environmental

impact. I've lived on the waterfront for nine years, and the reality as I've lived it is that jets are registering as high as 109 decibels, and many, many, many, many flights are in the 65 to 95 range.

The statistics that Massport tells us, they told us that we aren't in the noise contour map because even though we get all this noise, all these flights, they average it out over 24 hours a day, seven days a week, and we just don't quite come up to snuff. But fortunately with the new runway, we'll have 23,000 additional planes, so we will come up to snuff on that and get a few windows.

The reality is that jets are less than 100 feet over my three-story home, and also with the proposed mitigation that is to be given to Chelsea when we get the additional 23,000 flights, my home, which will get one flight every five minutes 12 hours a day, seven days a week, 100 feet over my house, even with the new map, my home is not in it, so I think there might be

something wrong with the way they looked at these things. How do they get their statistics?

The reality is that jets can be as close as one to two minutes apart at a time, and that Chelsea does not get that nearly as bad as some other communities, and yet this is how we're getting hit. The problem I have with the statistics is that we are not in the report as having noise impact. We have noise impact, and I'd invite you down anytime to hear it.

It's not mentioned in the report and it's not alluded to. How could that be? Chelsea used to be in the noise contour map and we were taken out. Why? Why were we taken out? Could it be because we have a lot of low income residents, we have a lot of minority residents in Chelsea? I mean, if they were going to have to put an environmental justice chapter in this report, we could really skew their numbers there a little bit if Chelsea was in it. I don't know.

T1.20.1

As has been mentioned, the noise monitor that was on Admiral's Hill was broken for two years. They only found out about it when the residents requested information and all these zeroes had been filed month-in, month-out for years and nobody at Massport looked at this, and this is how we are pretty much not mentioned in this report. It's questionable data.

THE MODERATOR: I'm going to have to ask you to wrap it up, please.

MS. QUINN: Thank you. You may not live in these impacted neighborhoods so how could you know from reading this report what the reality is? This is a flawed, skewed, and inaccurate report, and if I were a cynic, I could say it is manipulated data, so how can you make an informed decision when this is all that's in front of you? We need an independent unbiased study, and I hope you can help us with this. Thank you. T1.20.2

THE MODERATOR: Next will be Thomas Kershaw from the Greater Boston Convention and Visitors Bureau. Following him will be

William Falcetano.

MR. KERSHAW: Good evening. My name is Thomas Kershaw, K-E-R-S-H-A-W. I am a business owner. I own the Hampshire House on Beacon Hill, and I'm also chairman of the board of the Greater Boston Convention and Business Bureau. The proposed Logan Airport runway 14/32 is critical to the health of Boston's future convention and business travel, and restaurants depend on the visitor industry, and I urge the state and federal officials to move forward on the approval of this project. T1.21 T1.21.1

If we do not act now on this, we will be making a multi-billion dollar mistake on Boston's future. Our competitive position as a leading visitor destination is directly tied to the ability of Logan Airport to handle the region's air service needs. The new 14/32 runway will be critical to reducing delays and making Logan airport more efficient.

The success of the new 700 million dollar convention center that will open in

the seaport district in late 2003 depends on the efficiency of Logan Airport. If the delay problem is not addressed, it will cripple our efforts to attract and retain conventions, meetings, and business travelers to Boston.

At the very time when the new convention center will open, delays at Logan International Airport will have grown to the point that will be unacceptable to meeting planners, the people who choose the cities where they're having their meetings. As the new center reaches peak efficiency attracting more than 300,000 visitors a year, Logan will become a national disgrace with delays up to 55 minutes per flight.

I support the development of a comprehensive regional airport system and the growth that has developed in Providence, in Manchester, and Portland is to be lauded, as well as the new high-speed rail system from New York to Boston that debuts later this year. T1.21.2

Nevertheless, Logan remains the hub

of the region's transportation system for business travelers and for the convention and meetings market, and the success or failure of the industry and the restaurants like the Hampshire House depend on an efficient Logan Airport. Thank you.

THE MODERATOR: Thank you very much. Mr. Falcetano from Somerville, and following Mr. Falcetano we'll have Representative Liz Malia.

T1.22

MR. FALCETANO: My name is Phil Falcetano, F-A-L-C-E-T-A-N-O. I live in Somerville and teach at Merrimack College. I've become involved in this dispute reluctantly as the result of the sudden and dramatic increase of air traffic noise I and others detected last year about this time.

Along with other concerned citizens, I took the initiative and started organizing meetings about this problem in December of 1998 before the organization CARE had been formed. I shun these kinds of political battles and prefer to live a quiet life of reading, reflection and study.

Nevertheless, this problem has severely interfered with my ability to think, read, write, and pursue other necessary activities of a college professor.

I have lived in cities most of my life and have gotten used to the ambient noise of cars, trucks, pedestrians, kids playing, et cetera. However, persistent and loud air traffic is an altogether different matter. Since the sudden spike in air traffic over Somerville last year, there has rarely been a single moment free from the sound of a jet or a plane passing overhead.

I hear loud low-flying air traffic even in the wee hours of the morning, at 2, 3, 4, and 5 a.m. Those rare moments of quiet last only for very short periods of time. As the traffic picks up again, it continues with the dismayed mechanical persistency.

Noise produced by neighbors talking, passing by, or playing is usually short-lived due to the limitations of the human voice, fatigue, distraction. But mechanical noise is a different matter. It

has a relentless and super-human resilience that does not offer any hope of relief.

The deleterious effects of noise pollution are well documented in journals of medicine and psychology. Noise pollution is a physical assault on the body. Although sound is a physical phenomenon, sound experienced as noise is not only physical but psychological as well. Therefore, any attempt to measure noise by decibels entirely misses the point that noise is not mere sound but sound as it is experienced by a living human being. T1.22.1

In this case, so-called anecdotal evidence cannot be dismissed as though it were irrelevant with the wave of a hand and the smug presentation of numbers that measure sound because the issue is not about sound but about noise; that is, sound as an experienced phenomenon rather than a merely physical event.

Noise produces high blood pressure, hypertension, stress, fatigue, sleeplessness and its related disorders such as

irritability, disorientation, confusion, and incompetence due to lack of focus and inattention. Recent studies have even shown that undue and distracting noise also interferes with the ability of children to concentrate at school.

Noise from airplane traffic prevents people from being heard in their own homes, from talking on the telephone, from listening to the radio or television, from reading, thinking, praying, playing musical instruments, or any other activity that requires mental concentration or intellectual focus.

THE MODERATOR: Please try to wrap it up, sir.

MR. FALCETANO: Okay. I'll go to the end, then. Some of Massport's EIR is not completely accurate or satisfactory. I urge you therefore to refuse their request to go ahead with this unfair and injurious scheme to inflict even more suffering and hardship on communities that already endure a disproportionate burden of noise, air

T1.22.2

pollution, and traffic. Thank you very much.

THE MODERATOR: Thank you. Next we'll hear from Representative Liz Malia.

MS. MALIA: Thank you for hearing me.

THE MODERATOR: Just a second. And following Representative Malia, we'll hear from Dan Wolf from Cape Air.

MS. MALIA: Thank you very much. I'm not a transportation planner. I'm not going to try to look at numbers and draw any conclusions from that specifically. I am a resident of the city of Boston and I've lived here since 1967. I actually came here as a student. I love the city and I stay here. I stay here basically because of the quality of life and a lot of the aspects of the city make it a very livable place.

T1.23

I'm now an elected official. I worked for an elected official in the district I represent which is part of Jamaica Plain, Roslindale, Dorchester, and Roxbury. I have an extremely diverse community that I represent. One of the things that I look at

when I hear all the arguments that we've been going through over the last few months is the fact that there are questions here, some very serious questions, that I don't see answers to.

And as someone who's now an elected official involved in determining public policy, part of my concern comes from the fact that aside from having a chance to come to some of the meetings that were held in public because the community pushed them, I don't have a lot of information to work from, and that's one of the things that I think is at the heart of where we are today. We're talking about environmental impact.

What disturbs me is that what I see before us is a retread idea that was brought up 20 years ago that didn't fly then, that had very serious questions involved in it, and I hear too many questions about if we do implement the new runway, where are we going to be? The questions that really strike me are when people come in, Massport has been saying consistently that no matter what

happens with the new runway, we're going to increase our flights and our passengers coming to Boston by about 3.4 percent a year.

I have real concerns about once those people get here, what happens to them, where I see serious congestion on the ground already, and I know that there are serious environmental concerns with the effect of diesel just in general ground transportation. T1.23.1

I also am aware that one of the problems that I think we all need to be dealing with at this point as elected officials or state officials and as community people is dealing with the long-term transit needs that we have in this part of the country, and I don't see that happening and that's what troubles me.

If we get to a resolution on this runway and the runway is built, I am concerned that we're not going to see the follow-up on the regionalization because regionalization was not discussed prior to this what I feel is a short-sighted, short-term, narrow-minded approach. I'm afraid T1.23.2

that the officials who are now saying that as an afterthought, oh, yes, we'll work on regionalization.

We'll be gone, and then we'll find a couple of years from now they'll be in different jobs, I'll probably be in a different job, but I'm not sure that the issues around is Worcester really going to be expanded? How will we get people from the Mass. Pike to the Worcester Airport when there are houses in the way, when there's no accessible roadway?

I'm really concerned that the current discussion about putting money into a high-speed rail to Rhode Island, but I don't see any of those proposals coming before me and the legislature. I haven't seen any indication that these measures are institutionalized and have been committed to so that we're on some parallel tracks, that there's also -- there's a runway proposal but there's also strong proposals in place to get us to solutions for some of these problems.

So I just think that there are

health issues that haven't been resolved. We are very concerned about the fact that there was a lack of faith involved when the Community Advisory Council was removed from the discussion process for 20 months. That, to me, does not speak of good faith. That doesn't speak to me as someone who's coming to the table to deal with the facts as they are and to see who wins with that. T1.23.3

There's too many questions that are raised in the data that are brought out. I'm not comfortable that they've been resolved, and I think that we need to look at this data, the data Massport has already come together with, find some resolutions, and do some long-term planning.

Perhaps the long-term planning that we'll look at would consider a runway. I don't know, but I think too many of the other aspects that we're talking about have been severely overlooked, and what I don't want to see happen is to watch us come to the edge of this discussion. We've done it twice before in the last ten years.

We've had a series of discussions about whether or not we need a second airport and we've walked away from it. The problems we're trying to address aren't going to go away. In three or four or five years, we will have gone back up to the same number of delays, and we will not have gotten any closer to a resolution of our overall transit needs.

So my concern is that we get to that resolution phase now, that we not waste any more time, and we not put our hope in false promises or inadequate solutions, or one-dimensional solutions when what we need is a multi-dimensional comprehensive plan. We need Massport, we need the communities together, we need some serious proposals to deal with what happens to the city of Boston, its businesses, its economic vitality, its community, it's quality of life 10 years, 20 years, 30 years from now.

It's our responsibility now as citizens of this state to deal with those issues in the long term and not give in to a

short-term quick fix, well-intentioned, it looks like a good piece, but that's what my hope is that we move on to something more productive. Thank you.

THE MODERATOR: Thank you very much. I extended Representative Malia additional time as we did with the other government officials. Now we'll go back to trying to keep everyone to about three minutes. Next up will be Dan Wolf from Cape Air, and then we'll hear from Allison Stieber from Somerville.

MR. WOLF: Good evening, sir. My name is Dan Wolf. I'm the president and founder of Cape Air, and my goal tonight is to finish before you ask me to sit down. I'm going to be very, very brief. We have submitted a written testimony which really will speak for our position on this. T1.24

I have flown in and out of Logan Airport for the last 20 years as a pilot. Ten years ago I founded an airline, Cape Air, which literally flies now hundreds of thousands of people in and around the Cape

and islands and up to Boston, and we really depend on Logan to provide the service.

Our observation is that the primary problem relative to delays is the northwest wind which will cut the capacity of the airport when the airport is forced to go to that configuration to as low as 60 operations per hour from 120. So we see the runway specifically as a way to level the capacity of the airport regardless of wind conditions, that, and that alone. T1.24.1

As far as the regional approach, we are committed to a regional approach. I believe Massport is committed to a regional approach. Again, we've been here ten years dealing with Massport. We've had discussions relative to Worcester, relative to New Bedford, relative to Providence. We, in fact, are now providing hourly service out of Providence to the islands of Nantucket and Martha's Vineyard specifically for the reason that we want to pull some of the traffic out of Logan Airport, so we are pitching in and doing our part. T1.24.2

I just want to speak, and then I'm going to finish, a little bit about the process because I think a lot of the credibility issue here involves the process. My observation is, having been involved in this process for ten years, I was on the blue ribbon panel looking at a second airport, I've been to virtually every ARC meeting, I've been to virtually every public comment session, and I've been to many of the community meetings as well.

My observation is, and I really sincerely believe this, Massport has made an effort to listen to input. Massport has made an effort to analyze this from very, very different points of view, ours included. It probed and prodded me, I can tell you that, and whether I look at these people and say friend or foe depends on what the last prodding session was like because not all my interactions with these folks have been positive.

T1.24.3

They have sometimes advocated and attempted to implement things that would have

been very devastating to our business such as peak period pricing, but my observation is they really have attempted to do a serious analysis here, and have attempted to listen to the communities, and I know we have been listened to, and I believe that that's very important as you look at this document and decide on the credibility of it.

I do believe in the process. I believe Massport has done their part, and I also believe that you will do your part, and I think that the outcome of this is going to be a suitable outcome. Thank you very much.

THE MODERATOR: Thank you, Mr. Wolf. Now we'll hear from Allison Stieber from Somerville. Following her, Frank Gibson, and following him, Christine Silverstein.

MS. STIEBER: My name is Allison Stieber, S-T-I-E-B-E-R. I am a resident and homeowner in Somerville, a city that over the last 12 months has been bombarded by air traffic from Logan Airport, and especially during what Massport euphemistically refers

T1.25

to as the off-peak hours.

Off-peak hours in lay person's language happen to be times when people would most likely be at home; that is, nighttime, early morning, weekends, and holidays, times when people are trying to sleep, study, relax, or spend quiet time with family and friends.

For example, three days ago on Easter Sunday, we received a steady stream of aircraft at a rate of two planes per minute starting at approximately 6:10 a.m. and consisting of most of the day. Although 6:10 a.m. is the usual time for the daily onslaughts on our city during spring and fall, on this day they lost an extra hour of sleep due to the time change so, in effect, we were awakened by planes on what was the equivalent of 5:10 a.m. on what was supposed to be a day of rest.

Massport did what I describe as business as usual. However, to those of us who had to spend that day as we have so many others in a fog of fatigue caused by lost

sleep through late night, middle of the night, and pre-dawn aircraft noise, this was a mean-spirited intrusion by an arrogant neighbor that has repeatedly demonstrated its disregard for our community.

Massport officials have taken every possible opportunity to tell those of us who protest the frequent disturbances as well as to misinform the media that Somerville's air traffic rate is negligible and we are only getting our fair share.

A 300 percent-plus air traffic increase that Somerville would suffer if runway 14/32 is built is also dismissed by Massport as negligible because, according to its fiction, our current rate of air traffic is almost nil. However, those of us living under the flight paths know otherwise. We know that any semblance of peace that remains for us with the use of the present flight pattern will be almost totally obliterated by the tripling of the impact that we endure already. T1.25.1

Runway 14/32 would be more than a

potentially minor annoyance. It would mean an all-out attack on the quality of life. Some people talk as though the quality of life is just an antiquated notion. They are mistaken. If you take away people's ability to experience or even to be able to expect to live in a peaceful environment, then you are stripping them of what keeps them going, what makes them able to contribute to and function in an increasingly-stressful and uncertain world.

No amount of economic expediency can even begin to justify the magnitude of the assault that Massport and the FAA have planned for us.

THE MODERATOR: Try to wrap it up, please.

MS. STIEBER: Right. Runway 14/32 must not be allowed to be built. Its harmful effects will be permanent and will far outweigh any short-term benefits. Furthermore, current air traffic patterns that are injurious to our community should be scrutinized and amended. Finally, it is our

understanding that Massport is going to appear in Somerville next Tuesday, April 13 for a public hearing, and we expect to be there. Any member of the public is invited to attend.

THE MODERATOR: Thank you. Now we'll hear from Frank Gibson from the organization called NEED Logan. Following him will be Christine Silverstein from Nantucket, and following Ms. Silverstein will be Candace Collins Boden from the Provincetown Chamber of Commerce. Mr. Gibson.

MR. GIBSON: Thank you for the opportunity. My name is Frank Gibson, G-I-B-S-O-N. I live in Cumaquid on Cape Cod. I have some written reports here but I'll shorten it up. I'll begin with I'm a strong believer in the need to complete runway 14/32 and the center field taxiway. T1.26

Back some ten years ago when the former Massport board proposed PACE, this program for airport capacity efficiency, I organized a grass roots citizens group called T1.26.1

NEED Logan. It's an acronym that stood for New England's Economy Depends on Logan, and it still is a very valid one, and I offer it to anybody from Massport who wants to use them.

The proposed PACE was a program that was very detrimental to our local airlines with its pricing. Thankfully, the FAA determined that PACE was stopped. With regard to the current talk about period pricing and slots, there's no question in my mind that financially that limited access to Logan are not the answer to Logan's problems. Logan's delays are caused by weather.

The important factor for the airport is its physical capacity to handle all the flights scheduled by its users to arrive and depart as scheduled. As I understand, when all of Logan's runways are in use, Logan has the capacity to handle all the traffic scheduled by the airlines that are using it.

I'd like to emphasize the point, as Mr. Cohen from the South Shore pointed out,

too, using Logan's current runways, Logan can handle 120 operations per hour. However, with strong winds, as we heard, from the northwest, Logan is limited to one runway. And you know what it's like, those of you who travel to Cape Cod, there's three lanes of traffic and there's an accident and you're down to two lanes of traffic and then you're down to one lane of traffic, there's a hell of a delay.

As soon as the traffic is cleared, which is what runway 14/32 would do in effect, you'd wind up with cleared traffic. Runway 14/32 is not meant to increase the number of aircraft using Logan. Simply, it's to allow the aircraft currently using Logan to arrive and depart as scheduled.

I think 14/32 also would enhance the safety because it would be able to limit it to a lot of the smaller aircraft not to be following the same traffic patterns as the big ones, and you don't have to be six miles behind.

The completion of the runway would

T1.26.1
(cont.)

help the utilization of Logan at all times. Since aircraft arrivals on 14/32 would be over water, this is another thing. I think the thing we're here to talk about I think is the completion of runway 14/32. Noise would be mitigated because the departures and arrivals on 14/32 would be over water.

THE MODERATOR: Try to wrap it up, please.

MR. GIBSON: Sure. For those who are skeptical, I invite you to come down to Barnstable Airport, Hyannis and stand in the parking lot at the end of the runway, runway 24, which would be like standing in Harborside Hotel and watching the airplanes go down 14/32. I guarantee you would not hear them. That's the quality of life that should be very enhanced. I think you should consider that. Thank you very much.

THE MODERATOR: Thank you, Mr. Gibson. Now Christine Silverstein, and the next opponent after her will be William Manning.

MS. SILVERSTEIN: My name is

T1.27

Christine Silverstein, S-I-L-V-E-R-S-T-E-I-N. I've come to speak to you from the second busiest airport in New England, Nantucket Airport. We also have a hundred operations an hour quite frequently during the year.

However, the reason I'm here is not to speak about our relationship with you, and I also am quite aware that we are not involved in some of the regional planning that's going to be going on hopefully in New England here. I'm here to speak to you because I'm a member of the chamber of commerce in our community, and an esteemed fellow member of our chamber of commerce is Dan Wolf and he definitely came to our community and asked for our support for this project, and he asked our planning and economic development commission and I think also our board of selectmen, so that you will be receiving letters from those bodies from our town.

But I also am happy to hear that Dan addressed the process issue because I think that is important for you to know that

both of those bodies in our town will be writing to you not having had a public hearing to decide if our community actually did support this project. So I'd like the members of the communities here around the airport to realize that other communities are being lobbied to support this project without having the process that they should have before they make that kind of decision.

T1.27.1

We certainly haven't read the report, and I've learned more tonight than I ever knew about the issue, so I just would like you to know that there needs to be a balanced representation from our community and it isn't just the letters that you receive. Thank you very much for giving me the chance to balance that view.

THE MODERATOR: Thank you very much. Now we'll hear from Candace Collins Boden, Provincetown Chamber of Commerce. Following her will be William Manning from East Boston.

MS. BODEN: My name is Candace Collins Boden. Thank you very much for

T1.28

listening to me tonight. B-O-D-E-N. I have a whole different slant on this than anybody else who has spoken tonight because our airport is in jeopardy of becoming extinct. Our airport serves the outer Cape towns from Orleans to Provincetown, and if this runway is not implemented by you and you decide to consider peak period pricing, we are in jeopardy of losing our service airline which is Cape Air. T1.28.1

We have a contract with the National Seashore in Provincetown which is the federal government for our airline, and part of that contract is if we don't have a carrier, we no longer have the airport. Our airport is very vital to Provincetown. We have an elderly community. A big percentage of our community is elderly. Another big percentage is gay. There are a lot of health problems.

Our airport is our lifeline. It's a quality of life issue, but is our lifeline. Safety, number one; economic growth, number two. In the past ten years, I have been

promoting public transportation to Provincetown from visitors because our roads are getting smaller and smaller, the bridges are getting smaller and smaller coming onto the Cape, traffic is terrible, and we really depend on public transportation.

So I'm asking you please build that runway and don't consider peak period pricing and save our airport. Thank you.

THE MODERATOR: Thank you very much. Now we'll hear from William Manning, East Boston. Mr. Manning. Mr. Manning doesn't appear to be here. Is Gerry Falvo from Winthrop here?

PARTICIPANT: He left. He's going to testify tomorrow night.

THE MODERATOR: He will speak tomorrow night. Thank you very much. Peter Koff from Boston. After Mr. Koff, we'll have Charles Carrera and Enrique Miranda.

MR. KOFF: Thank you. My name is Peter Koff, K-O-F-F, for the record. I'm the attorney for Airport Impact Relief, AIRINC, which was founded in 1980, and I think has

T1.29

been a consistent voice of the need for sound transportation planning and concern about proposals of Massport that might increase capacity and environmental impact. I also am an officer and board member of the new regional group, Communities Against Runway Expansion. In three minutes, it's kind of hard to provide comments on the Massport proposal so I'll try and simply just hit some bullet points.

First, AIRINC quite strongly believes that the benefits of the proposed runway, the degree to which it will affect the delay problem are greatly overstated in the reports, and that's certainly made clear in the report of the CAC. We also think the impacts on the surrounding communities are substantially understated. As an example of the overstatement, Massport tonight, in fact, said for over a decade there's been a delay problem at Logan Airport. For over a decade, Boston has continued to grow quite nicely. Its business has expanded, convention centers being planned and to be constructed. There's

T1.29.1

T1.29.2

been no sense that the economic lifeblood of Boston or Massachusetts has been crippled by what's been a problem for ten years.

It certainly would therefore be unreasonable to assume that in the future suddenly the economic foundations of Boston are going to collapse. A kind of hysteria is being used to trump up support for this runway as far out ahead of any possible benefit that it might serve. Other problems, we suggest, exist with the report are the use of old data. That's been mentioned already. T1.29.3

In terms of alternatives, they haven't been adequately examined. I specifically call attention to the letter that I wrote on behalf of my client, Airport Impact Relief in October of 1997 which was addressed to Mr. Blute, CEO, executive director of Massport. Copies went to counsel for Massport, Betty Desrosiers, the head of the FAA, the regional director of the FAA. T1.29.4

In that letter, we made it clear that we thought Massport was going to give peak pricing a chance before it went forward

with the runway. We talked about the need to specifically look at Hanscom Airport and other alternatives to expansion at Logan, and we asked specifically to sit down with Massport and start the process of discussion of some sensible ways of dealing with the issues surrounding airport growth. We did not receive one response to this letter. Nobody from Massport ever called us, ever offered to sit down, and ever talked with us specifically about what their plans were.

We think that shows, and I'm moving into another one of our concerns --

THE MODERATOR: Try to rap it up, please.

MR. KOFF: One of our concerns is under the Airport Act, 49 United States Code, Section 47-106. The interests of the community have not been given fair consideration. We have not been told that we were required to be told that we have the right to petition the secretary of transportation because we are not represented on the Massport board. Protection and

T1.29.5

enhancement of the environment, inter-modal planning requirements of federal law, and I also mention Section 47-101 have not been followed. T1.29.5 (cont.)

And lastly, the issue of trust upon which Massport bases much of its case, we obviously do not trust them when they cannot document how 75,000 flights are going to be over water, and when they tonight say that the second major airport study concluded that such an airport would be unfeasible, when one or two speakers later the representative for the Massachusetts Aeronautics Commission said that two sites were recommended in that report. Given the lack of accurate information and the inadequacies, we ask that the secretary find the report to be inadequate and require a new draft, and we urge the FAA to withdraw its support of this project. Thank you. T1.29.6

THE MODERATOR: Thank you very much. Now we'll hear from Charles Carrera and Enrique Miranda from the Logan Airlines Management Council. They asked to be called

together so I assume we have a duet. And then following these individuals, Curt Walter from Cambridge.

MR. CARRERA: Good evening. My name is Charles Carrera. I serve as the director of airport services with Cape Air-Nantucket Airlines. In addition to those duties, for the last three years I have served on the executive committee of the Logan Airlines Management Council, and am privileged to serve as its president. I'm here tonight in my capacity as president of LAMC. I'm also here with my colleague, Enrique Miranda, who is current chairperson of the cargo subcommittee of the Logan Airlines Management Council. T1.30

We have a written statement but I'll just make a brief comment and submit this written statement for you. We rise in support tonight of the series of air side improvements that are currently being proposed by Massport. In an effort to reduce delays and improve efficiency on Logan's airfield, we support the following projects. T1.30.1

Construction of a unidirectional runway 14/32 for over-the-water operations, construction of a center field taxiway to reduce taxiway congestion, a realignment and extension of the existing taxiways to enhance airfield safety, and a reduction of the approach minimums on runways to upgrade Logan Airport to industry standards.

MR. MIRANDA: On behalf of our cargo customers, we annually ship 814 million pounds of cargo and mail out of Logan International Airport. We strongly, the cargo subcommittee strongly supports the Logan air side improvement project. T1.31 T1.31.1

MR. CARRERA: And on behalf of the over 26 million customers using Logan Airport, we strongly reiterate our support for EOEA 10458, and we'll submit comments for the record, and thank you for the opportunity to address you tonight.

THE MODERATOR: Thank you very much. Mr. Walter is no longer here. Is Arthur Krolman in the audience? Mr. Krolman will speak, and then John Tarter from

Winthrop.

MR. KROLMAN: My name is Arthur Krolman, K-R-O-L-M-A-N. I'm a business owner and homeowner in Charlestown. It is my understanding that the unidirectional use of proposed runway 14/32 cannot be legally guaranteed by the Massachusetts Port Authority, the Federal Aviation Administration, or the commonwealth of Massachusetts. T1.32

Consistent with their proposed use, Massport has analyzed runway 14/32 as a unidirectional runway only. However, to better satisfy the aims of the National Environmental Policy Act and the Massachusetts Environmental Policy Act, the scope of the EIR/EIS should address the possible future implementation of bi-directional use. Thank you. T1.32.1

THE MODERATOR: Thank you very much. Now John Tarter from Winthrop. Is Mr. Tarter still here? Not seeing him, is there an Alan Wright from Roslindale in the audience? You're up, sir.

MR. WRIGHT: Thank you. My name is Alan Wright. That's W-R-I-G-H-T. I live at 57 Arbor Road in Roslindale next to the Arnold Arboretum. I am here tonight representing my family and neighbors, all of whom are very concerned about Massport's proposal. T1.33

When runway 27 is in use, the direct overflight of Roslindale and the Arnold Arboretum is unrelenting and deafening. Massport's proposal to build runway 14/32 will triple; that is, increase by three-fold overflights to over 45,000 per year. That means an average of over 130 flights per day year-round. T1.33.1

This is intolerable, unreasonable, and unfair. It must not be allowed. When flights are overhead and I am outside playing with my child or talking with my neighbors, we must stop talking as we cannot hear each other, and we are located more than six miles from Logan.

Massport has not adequately addressed what the quality of life of 35,000 T1.33.2

residents in Roslindale, the tens of thousands of visitors to the Arnold Arboretum who come from all over Massachusetts and other New England states, or the hundreds of thousands of residents of urban Boston and surrounding communities must decline.

Part of the problem is that the pilots never follow through on the runway 27 flight pattern. Instead of staying over Franklin Park or Forest Hills Cemetery, they get off over the Arboretum and Roslindale. Massport must fix this problem. T1.33.3

My family and I and my neighbors do not want Logan to be shut down. We use it. What we want Massport to do is to end the continued growth of this very badly-located airport, and truly shift traffic to other airports including Hanscom. T1.33.4

I also would like to react to some of the business testimony that's been given today. I work in the business community, I fly to other cities and conventions. I am increasingly using teleconferences and e-mail. It has resulted in a decrease in my

attendance to conferences and to outside meetings.

I do not believe the testimony from the ADL consultant's vice president. His clients are not asking to meet with him. His clients are talking with him through teleconferencing, through e-mail. It was a canard. The real issue here is the quality of life in the greater Boston area and it will not be improved with the implementation of runway 14/32. Thank you very much.

THE MODERATOR: Thank you. At this time, we're going to take another five-minute break and we'll reconvene at 9:30.

(Brief recess taken.)

THE MODERATOR: Let's reconvene. If anyone is outside, you can call them back in. We're back on the record. We have exhausted our list of supporters so all we have left is our opponents. There are 16 names on the list. I'm going to run through them all and if somebody is not here, then I will skip them.

First would be Rob Trainer from the South End. Is Mr. Trainer here? I don't see him. Richard Goldhammer from Hingham, Mass.? How about Englehart from Hingham? John Mahoney from Malden? Darryl Pomicter from Beacon Hill? Did I mangle that name?

MR. POMICTER: Pomicter.

THE MODERATOR: Jeff Buck? Joe Galino? Bob Driscoll, Sr.? Roland Choquet? How did I do with that one?

MR. CHOQUET: That's okay.

THE MODERATOR: Very good. Rick Rose? Bill Galvin? Dovi Abbey? Kathy Callahan? James Stamos? Todd Payton? There are a few that aren't here so we'll proceed very quickly now hopefully. Mr. Trainer?

MR. GOLDHAMMER: Actually, Richard Goldhammer from Hingham. Good evening.

THE MODERATOR: That's right, Richard Goldhammer from Hingham.

MR. GOLDHAMMER: Thank you. I just want to share basically three points briefly at this late hour. One is the fact from my perspective as a Hingham resident near the

T1.34

Hull line. The planes overhead, the rate is one per minute, the frequency is four to five days per week, the hours are from 5 a.m. to 10 a.m., and at 5:30 p.m. to 2 a.m. The noise level of 65 to 95 decibel range, that's equivalent to the noise of an average lawn mower up close once a minute.

My second point is that it's negative and very significant to myself and the neighbors. Being woken up at night is a problem when the right to required sleep is a right which is taken away. I have trouble hearing myself think which is a right taken away.

Playing with my daughter outside peacefully without interruption is a reasonable right that's taken away. The stress that my wife reported. During low cloud coverage, a plane appeared so low she thought it was going to crash into our neighborhood over World's End in Hingham is a right to peace of mind which is taken away.

Nearby Wampatuck State Park, World's End Reservation which is supposed to

offer some solitude and repose for our citizens, are rights that are taken away. So the rights of the minority business community appear to override the rights of the majority of the citizenry that is surrounding the airport. Thank you. T1.34.1

The third issue is Massport's trustworthiness is highly suspect just from my experience. I had sent an October letter to Peter Blute and asked specifically, I've heard about this runway extension. Will flights over Hingham expand? Just wondering would you please do me the justice of giving me an honest answer.

Blute's reply, November 19, 1998, second-to-last paragraph: Massport is evaluating plans to improve the efficiency of Logan's airfield. By reducing congestion and delay at the airfield, planes will spend more time on the ground or on route and less time circling in the air.

I have a problem with that. He knows I'm a Hingham resident, and it's not about circling flights, it's about the 85,000

flights that are projected into those runways that fly over Hingham and Hull. When I asked him specifically would flights increase, I get a five-paragraph letter that says nothing, and I'll be happy to share it with you in full piece.

Shortly thereafter, the graphic came out in the Globe and said that flights in Hingham would increase from 32,000 to 85,000. So I leave you with some questions. What is the impact from a human perspective on residents of these communities?

Where do people like Christopher Good live, Mr. Guzzi live, Mr. Sherman, Christopher Anderson, Kevin Cohen, members of the business community? I submit they do not live in Winthrop, East Boston, Roxbury, Dorchester, Hingham, Chelsea, or Hull. They do not. We could probably check that out to be certain.

And is it true that high tech. companies, in fact, will be attracted to the lower cost of doing business inside or outside of the city? Where is it cheaper to

do business, inside the 128 belt or outside? Have they thought of that?

Is the logic the same that we've seen in years past? Let's serve their franchise with a hopeful trickle-down benefit to the region, or is the logic not to take seriously the majority of the citizenry? Thank you.

THE MODERATOR: Thank you, Mr. Goldhammer. Now we'll hear from Albert Engelhart, also from Hingham, followed by Darryl Pomicter.

MR. ENGELHART: Good evening. My name is Albert Engelhart, E-N-G-E-L-H-A-R-T, of Hingham. We're like a church service, it's a small group, and some of you wanted to come up front but it's kind of lonely up here. I'm currently a registered professional engineer and I'm firmly in the camp of high technology. I am one of the individuals representing the seemingly parochial interests of Hingham and Hull and Cohasset and Scituate. T1.35

In regard to runway 14/32, I am T1.35.1

opposed to it. If it's turned on, it will produce a tremendous increase in noise pollution which will exacerbate the already 60-second interval of planes that occur overhead on certain days. The expression greater Boston area, and the expression high tech., what does that mean? To me, and I think to 95 percent of everyone here, it means areas, for instance, Route 495, all areas radiating out from without and within 495 extending out beyond Worcester and 128. T1.35.1 (cont.)

Surely in jest that Boston Logan Airport area which is a tiny kernel within a very, very large net, can it honestly speak for outlying areas up to one-and-a-half hour's distance away? It's acting as though it's the sole spokesman.

Currently, there is tremendous political and economic power inertia locked in a small airport called Logan. I suggest that it be mandated that Massport divest itself of this censorious position, this almost fetish, drive, to make Logan the only existing means of air transportation, and

instead, Massport should revisit the greater reason called Massachusetts. Massport means Massachusetts Port. They're representing a very small area.

Instead, a tri-state organization, Rhode Island, New Hampshire, and Massachusetts, initiated by Massport should consider Hanscom as a strong candidate, Worcester, Green, Manchester airports. T1.35.2

THE MODERATOR: Try to wrap it up, please.

MR. ENGELHART: Sure. Finally, a fundamental fact about noise pollution and a recommendation that Massport be a true leader instead of a retread, as someone mentioned here before. For 40 years as an engineer, I know that fuselage problems making noise could have been corrected. It wouldn't have been corrected tremendously but they would have been significantly corrected, and it's not taking place. T1.35.3

General Motors, Ford, all the automotive companies have been forced in their areas to correct pollution problems.

The cost was tremendous at first and now it's routine. The same thing could happen if Massport took the initiative and started to force like California does. They say to Ford and General Motors and Chrysler and says you conform to our standards or no cars.

T1.35.3 (cont.)

Massport, in cooperation with the tri-state area, could start that process. That's why a lot of us aren't talking to the others, we're not talking with each other, we're talking against each other is the noise problem that could be corrected by now. It's an economic problem. It will take years to fix but it has to be started. How about Massport getting started on that? Thank you.

THE MODERATOR: Thank you. Now Mr. Darryl Pomicter from the Beacon Hill Civic Association. Following him we'll have Jeff Buck. Is John Mahoney in the audience? Mr. Pomicter.

T1.36

MR. POMICTER: I'm Darryl Pomicter, president of the Beacon Hill Civic Association here and on the CAC. I'm a long-term resident of Boston and I am trained as a

civil engineer. For all the reasons stated, we are against the new runway. This is a short-term partial inferior solution. We feel a longer-term solution that shares the wealth, that doesn't risk overloading the city. T1.36.1

That said, I'd like to go on and give some comments criticizing Massport's presentation of the information, and I've been very involved in this. Massport presented an overwhelming amount of information formally and informally. While most of that information is accurate, factually much of the presentation and information in print and verbally is inconsistent, misleading, and deceptive misinformation.

Many normal people are overwhelmed by it all and believe they have to accept the facts as presented, but they have to realize that if those facts are not accurate, the conclusions are inconsistent and wrong and don't need to be accepted.

Some examples. Director Blute T1.36.2

keeps talking about the 70,000 flights over the water and the few percentage of PRAS flights that are going to be rearranged in the city. Those 70,000 flights, about 50 percent, 15 percent of Logan's operations. Those few percent add about 40,000 flights to runway 27, 30,000 to runway 33, and 10,000 to runway 22. Since both airports get a couple of those -- neighborhoods get a couple of those, neighborhoods can easily get 50 to 70,000 increased flights even though 70,000 are initially aimed over water.

T1.36.2 (cont.)

Director Blute also talks about we have to do this because otherwise 90 percent of the traffic will be using only the north-south runways. Of course, even if we do do this, 90 percent of the traffic will eventually be forced to use both the north-south runways because there are no limits on operation plans, and it will only take a few years to get back up to those levels and exceed those.

Logan's ranking as the 11th in the U.S. in operations and sixth in delays has

been a justification for the runway. At one of the ARC meetings a couple of months ago, we pointed out that there was also a ranking of 17 from passengers.

Seventeenth in passengers means there are fewer than average passengers on an airplane, so if you can get more passengers on the plane, you need fewer planes, and you could cut the delays by working that side of the equation. You need to work both sides of the equation. Recently, talking about sixth in delays and 17th in passengers, so they just upped the ante but he doesn't mention anything about getting more passengers on a plane. T1.36.3

Massport, in their EIS, details in great detail going from sixth in 1997, to sixth in delays in 1990. They don't talk about the FAA statistics. They mention that 2 1/2 percent, 25 per thousand, they don't mention that that's down from 40 per thousand or almost 40 per thousand in 1992. T1.36.4

There is no handicap. They have this drive that we're going to be the best

somehow. Second or third is not enough. There's no handicap for the location in New England which is confining, which has New England weather, and while it's cramped in the city, that actually should decrease the amount of time that it takes to get back into the city assuming they don't overload the local transportation systems.

THE MODERATOR: Try to wrap it up, please.

MR. POMICTER: Okay. The 65 million dollars they say is going to be saved by building this runway, easily if you do those analyses you get up to a billion dollars whether you talk about 20 hours a week times 50 is a thousand hours a year per person, you can easily get to the billion dollar figure. The amount of delay hours issue, the percentages have gone up, down, and sideways back and forth, but if you dig into that report, there is a chart where you look at all actions except 14/32 and all actions with 14/32, and the difference is 20,000 hours. It's a 15 percent reduction

T1.36.5

even though you've got to look under the cars, under the piece to find that.

The last item is, Hanscom, asking if they're going to use it, when they talk about general aviation and it had more operations than any airport other than Logan, they overlooked the fact that -- they specifically mentioned Portland, Maine, we're more than Portland, they don't mention the fact that 70,000 of those touch-and-go's, that there's still 40, 50, maybe a hundred thousand dollar operations capacity at Hanscom that they have no plans to use. Thank you very much. T1.36.6

THE MODERATOR: Thank you. Now we'll hear from Jeff Buck, and following Mr. Buck will be Mr. Galino from Melrose.

MR. BUCK: Good evening. My name is Jeff Buck. I'm a Chelsea waterfront resident. I'm also the president of the Chelsea waterfront. Betty, I'm glad you made it back in time for my three minutes. I was hoping you wouldn't leave me hanging there.

I have just a small little

presentation. I'm sorry it's not as slick as Massport's presentation. I was trying to get some money from them but it got delayed due to some hot air delays. Basically, this is a community I live in. This is Chelsea. This is a waterfront. This is a community that has struggled like all the communities to improve itself, to improve every aspect of it.

Massport's had a big influence on the quality of my life. We've got this huge green bridge a block away from where I live, and I have airplanes that come over my head. Unless you're there, you really can't understand what it's like. I run my company in Chelsea and I've invested in Chelsea, and it's quality of life.

Arthur, Jay, Christopher, John, you guys have the power to help the people. It's not about the money, it's about the people. Boston is the coolest city in the United States. Everybody here knows that. That's why we're here. There's no place better. You could close Logan down, you could close

them down, and is that going to keep anybody from coming to Boston? No.

I came from Florida, the man who works for me came from Alaska. This isn't a question of money. It's a question of quality of life, and you guys, you're the environmental protection, you're there for me and these beautiful people out here. Whether they support Logan or not, if they do support this runway like Betty and Flavio and all those guys, you can't listen to what they want because they don't know any better. You know what's right. You know it's about the people.

I ask you, is the lack of business going to be due to the runway coming in? Are we going to lose business because of this? No. I'm a businessman. I work 12 hours a day, and I do whatever I have to do to overcome obstacles, and they're there every single day. My hands bleed at the end of the week. Business goes on regardless of the obstacles in front of it.

We're in an economic boom. We're

kicking ass. This country is stronger than ever. We have our problems, but we are Americans, we work hard, we overcome. Look at this cute little girl right here, and right behind her is this huge X files-looking oil refiner. I'm not even sure what it is. This is the Admiral's Hill area that we talked about.

THE MODERATOR: Try to wrap it up, please.

MR. BUCK: Well, I'd just like to say that Jay, Arthur, Christopher, John, Betty, Flavio, David, and Deborah, you guys have the power. Twenty years from now, you're going to be retired, you're going to be somewhere else, and none of this is going to matter, but before that 20 years passes, actions you take right now are going to affect millions of people. I have faith that you will make the right decisions. Thank you very much.

THE MODERATOR: Thank you. Mr. Galino, is that right?

MR. GALINO: Galino.

THE MODERATOR: And following Mr. Galino will be Roland Choquet.

MR. GALINO: Thank you. I appreciate the opportunity to speak even at this late hour. I appreciate you guys hanging around. My name is Joe Galino, and I am here to speak on behalf of the city of Melrose. I'm the CAC adviser for the city of Melrose. I'm the mayor's adviser, and I'm also a treasurer and director of CARE. T1.37

I'm here to ask Massport tonight to withdraw their proposal until such time as they can come to my community and explain the impact that this new runway is going to have on my community. At the last ARC meeting we had, I asked Betty to come talk to the community and she said they would. I then called. I spoke to our board of alderman and they requested Massport come. T1.37.1

I called Betty and I then spoke to a few other people, but I got the official response that Massport has reconsidered their policy with respect to individual communities, and that I would get a letter

explaining their position sometime in the next ten days. That letter did come, it's here. It basically doesn't say anything other than they're not coming to Melrose.

I find this unacceptable for my community to sit here and not have the opportunity to have Massport come and give their presentation. I guess we're not alone in this. There's been several communities where I've heard that they've gone so many other places to tell their story.

A letter has gone out recently from our state rep., Mike Fester, and I sent it to Richard Dusset and I assume you have that letter, as well as other North Shore representatives from other communities from the North Shore. We haven't heard yet. I'm wondering, Betty, if we are going to get that meeting. Is that something you could give us an answer on?

MS. DESROSIERS: I don't have an answer on that tonight, but we did just receive that letter.

MR. GALINO: It was probably a week

ago. It went out over a week ago.

MS. DESROSIERS: It just crossed by desk.

MR. GALINO: Okay. Fair enough. But considering there's 15 days left for the public comment period, I'm assuming there's not really enough time for our communities to respond on the North Shore. Melrose is only five miles away from Logan Airport, yet it isn't considered by Massport to be noise-impacted.

If you look at Massport's computer-generated flight tracks, you won't see a jet flying over Melrose. We have some great shots here that show, you know, these different flights in the computer-generated models, but yet I can look up any day and see jets flying over Melrose. They're not in the modeling, so I would suggest that they do modeling that doesn't quite reflect the reality of what's really going on up in the skies. T1.37.2

Whether I'm in my home, my office, I can hear planes. Now, I've been told that

we get a lot of commuter planes and I should be thankful for the fact that we're getting a lot of commuter planes but we're not getting jets, and I would only say to that, if this new runway is supposed to take some of that commuter planes and put them out over the harbor, where are jets going to go? Shifting commuter planes to this new runway, that's going to open up some opportunities for more jets to come north.

THE MODERATOR: Try and wrap it up, please.

MR. GALINO: I'll try to do that. Massport currently gets 4 percent of the traffic, we're supposed to get I guess 12 percent now with the new runway. That's 20,000 flights now. That means an increase of 60,000 flights. That's with current levels of half a million flights a year.

If we go to the 750,000 flights Massport's projecting or potentially a million, I've heard different numbers, you know, that means 90 to 120,000 flights over Melrose. We now get 20,000. We can't get

Massport to come to our community to explain how we're being impacted.

I would like to ask that an independent council be established to look at this issue. I've heard that there's been many studies before. I'd like this to include the citizens, the communities, have their input. I'd like to ask MEPA tonight to stop this project until such time as such a council can be put together to research all of the options, especially the mayor of Boston's suggestion about a new airport. T1.37.3

Boston is a world-class city. The citizens of Massachusetts deserve a world-class approach and long-term solution which meets its transportation needs. Thank you.

THE MODERATOR: Thank you very much. Now we have Roland Choquet, followed by Bill Galvin.

MR. CHOQUET: Good night and thank you for hearing me. My name is Roland Choquet. I come from Chelsea. I'm also a member of the CARE group, Citizens Against Runway Expansion. More than 25 communities, T1.38

as I understand it, are now involved in that, and I object to the expansion of the runways, unless you want to put it at Hanscom Air Force Base and build an airport there. T1.38.1

I think it's a sensible idea to limit any further growth at Logan. It was understood with a court injunction some 25 years ago that it was enough then, it's enough now, and more is not always better. You can sink a community by having too much of this sort of thing. T1.38.2

There's too much noise on the idea of pollution, noise pollution. Amnesty International has declared the number one form of torture in the world to be sleep deprivation, and I'm sure there are a number of people from the communities, the 25 communities that have since in the last month basically banded together to form CARE, we've heard tonight, too, that people aren't sleeping well.

This affects our children, it affects the people who work, and the business people ought to be concerned about that than

their people arriving late for a meeting. Their Massachusetts worker productivity is diminished. I know in Chelsea we have a B.U. school partnership, Boston University, and we have basically 47 nationalities in Chelsea, our school reports come out in five languages, and the children and the parents are requesting of B.U. to get the children rested. That's one of the primary requirements.

Try doing that when we have currently 9,000-some flights scraping our houses a hundred feet overhead, and you can watch the planes go by your house and see if the lunch trays are up or down. It's a little too low and too loud, the noise pollution again. If children aren't sleeping, if affects their grades. Consider that as an environmental impact, a serious one at that.

I think that it would be a sensible legislation to pass requiring aircraft manufacturers to reduce the level of noise permitted from the jets. What's the point of

this remediation on our windows? You're affecting several million people. Give them all windows, great, but you can't go outside and enjoy life. They can't play with their children. The pollution from the unburnt gases of jet exhaust has been coming down on their approach to Logan.

They don't combust all their gas they use in their engines. Maybe when they cool it down, they'll land, but what is that, a hundred feed over your head dumping on your house? We wash our windows in Chelsea. Two days later, there's a clear film and you can't see out of them. It's all dusty-looking.

We have some serious health considerations to this airport proposal. I have an alternative I'd like you to consider if it's within your power. Quickly, the idea of using Hanscom again. There's an aquifer to serve the Boston area with water from the Quabbin Reservoir. I'd like to recommend or suggest that Massport utilize Hanscom and get those blowing machines as soon as they're

T1.38.3

done with the aquifer, put a high-speed train, as Governor Cellucci mentioned.

It was a great thing to happen for the New York to Boston, run from Hanscom to the end of the Red Line, nice short trip, dedicated runway underground, won't impact communities, you don't have to go through abutting property and all that, and just have commuters land at Hanscom or take off if they wish, especially the high tech. area. We're talking about 495, 128, and Route 2.

Basically it would serve those commuters. Basically shuttle people back on high-speed trains so that there's no difference between landing at Logan or at Hanscom, and I think that's a possible sensible alternative to any more business at Logan.

As was mentioned, we have an objection to any more growth. Massport told us tonight it's not expansion but Citizens Against Runway Expansion is our group. If you add a runway, it is expansion. I'd like to argue against Massport's claim that it's

T1.38.4

not. I thank you for your time and hope you consider these things for the health of our children and our workers. Thank you very much.

THE MODERATOR: Thank you. Next we'll have Bill Galvin, and then following him, Mr. Abbey from Roxbury.

T1.39

MR. GALVIN: I'd like to address two issues. The first one is as to credibility, and the second one is the issue of environmental and social justice. My name is Bill Galvin. I'm a former licensed professional pilot and former general council in EOEA, but most importantly I'm the CAC representative from Charlestown.

On January 20th of this year, Director Blute and Massport came to Charlestown and told us three things. They first told us that it was something good for Charlestown in this document. When we asked them what it was, they couldn't tell us.

The second thing they told us was that there would be no negative impact from this. When it was pointed out to them that

air traffic over Charlestown would triple and the magic 65 DB line would come over from Chelsea down Admiral's Hill and start crossing the Mystic River, it just stopped short of Charlestown, they put it into their computer model in the most insulting way.

They told us in Charlestown that it was a question of fairness, that we had to share the burden. Charlestown. Now, 50 percent of Massport's -- Tobin Bridge, 24 hours a day, seven days a week, like noise and air pollution covering like a big dark cloud over our poorest section of Charlestown, an 1100-unit low-income housing project and another 347 subsidized housing development, 5 or 6,000 people there.

So the third thing that they told us -- I lost my train of thought. I apologize. One second. They told us, one, that it was -- and then the fairness issue. They have the bridge. And the last thing, we have 50 percent of Massport's seaport. We have the cars that come in to Boston Harbor. Massport's very proud of the fact that it has

a capacity for 220,000 cars. Averaging ten cars per truck, big noisy trucks that carry these cars, that's 44,000 truck trips in and out of Charlestown, one little square mile, in a given year.

Now, over in East Boston, in Revere, in Winthrop, 4400 houses are sound-insulated. This new proposal suggests that Chelsea, the poorest city in the state, get 1100 homes sound-insulated. Massport has a choice. They own two airports, Logan and Hanscom. There's a perception that the folks in Lincoln and Lexington and Concord, the affluent and powerful communities, are being spared. There are no houses, no households, in Lincoln or Lexington or Concord or Bedford that we know that are sound-insulated. So where is the fairness and where is the justice? T1.39.1

THE MODERATOR: Try to wrap it up, please.

MR. GALVIN: This is my final comment. Two years ago, I chaired a Massport meeting on the Tobin Bridge. They were

sandblasting and painting because the last time they had done it, some of our children were poisoned with lead paint. They said they were going to monitor it.

So they came to this meeting with their environmental consultant, their expert on locating this monitor. He suggested putting it further away from the bridge in the Bunker Hill housing project. He suggested putting it further away from the bridge at our Head Start school and its accompanying playground, and more importantly, he wanted it put to the west of the bridge.

So I suggested to him that the prevailing winds were from the west, southwest, and northwest, and he said, the Massport-paid environmental expert said, in Boston, all these winds average out over the course of a year. Two months later, I was in this room at a CAC meeting. Now when it served Massport's purpose to have this northwest wind direction that's the subject of this report, now all of a sudden Massport

came up with documents that said twice as much wind came from the west than the east.

So if Massport is willing to lie, willing to deceive through experts and consultants and reports, when children's health is at stake, I suggest to you you should examine and question every assertion and every alleged fact in that report because they cannot be trusted. Thank you.

THE MODERATOR: Thank you. Next is Dovi Abbey.

MR. ABBEY: Good evening. My thanks for staying. My name is Dovi Abbey. I represent Roxbury on the CAC, the Citizens Advisory Committee to Massport, and we just had a meeting last week with Massport. The newspaper article came out and heard what the community had to say. There was an overwhelming no, clear and loud, to 14/32 and to runway 27. T1.40

But clearly, all of us in the community minus one or two, we all are unequivocally opposed to runway 14/32. The main reason we believe it's a bad idea for T1.40.1

the city of Boston, and I've looked at many other cities with the magnitude of Boston. They do not fly without permission.

The airport that serves Paris are away from the city. The gentleman from Arthur D. Little was here earlier. He said colleagues are not flying downtown Paris, and there's absolutely nothing wrong with that. Business people do not have the god-given right to fly into downtown Boston. Communities in this area have a right to remain silent and quiet. We can't talk to our neighbors.

Boston is not a collection of runways. It is, first and foremost, a city with people, a history, a place to be preserved. Economic activity is not justification for a great city in severe disruption of the city, of its inhabitants. The high tech. over here might be mistaken. To all of them involved in high tech. have an airport that has two terminals. San Jose has two terminals A and B, period. Logan has an airport that has five terminals.

T1.40.1 (cont.)

In Roxbury, we have a tremendous burden right now put on us. Sometimes planes are 18 hours a day, and for up to five to six consecutive days, that is not conducive to economic health. I don't think the city of Boston can afford any more flights. People will desert the city for the sake of accommodating more passengers. Those can't be accommodated reasonably, economically, and especially with the consequence of a well-planned, well thought out approach.

Yes, there are international flights and I am addressing that in particular, because if you look at the report, Massport is saying that that was one of the fastest-growing segments. There were no international flights from any other airport in this area. It is not acceptable.

THE MODERATOR: Try and wrap it up, please.

MR. ABBEY: Sure. So let me just say that I urge you respectfully, MEPA, to avoid this. It also smacks of -- this battle was fought in 1970 and lost by Massport.

This is no time to fight the battle of the 1970s. We should try to get into the 21st Century. It's coming, a year away, and I think that should be the main focus. To use a very sad analogy, let's not turn Boston into Baghdad. Thank you.

THE MODERATOR: Thank you, Mr. Abbey. Is Tom Payton still with us?

MR. PAYTON: I sure am.

THE MODERATOR: As Mr. Payton approaches the microphone, is there anybody else in the audience that remains that signed up that still wishes to speak whom I didn't call? Anybody else who wants to speak and didn't sign up? All right. Mr. Payton, you have the honor or being our last commenter this evening.

MR. PAYTON: Great, and hopefully not the least. It's Todd Payton, P-A-Y-T-O-N. I live at 107 Roxbury. I am right under runway 27's flight path. That was changed so mysteriously a couple of years ago but I'm not going to talk about that now. T1.41

But I just want to go on record as

saying that that is a serious issue for that bay, and I hope that they will revisit that issue to look at and monitor what's going on with that, because I really believe that there are shenanigans going on.

The second thing I want to say is, runway 14/32 cannot go through. Eighteen thousand flights over my home right now. They're talking about going up to 67, 80, depending on who you listen to. Under no uncertain circumstances can the communities of color, of Roxbury, which already has 50 to 300 times the disease and death rates, can take another added stressor of noise and air pollution. We can't take it. T1.41.1

Having that runway go over our neighborhood is going to increase our death rates. I don't care how many people got to stand up and wait to come into Boston. I'm a business person. I'm a business owner. I fly to the airport. If it means people not dying, I'll travel five hours to get on an airplane.

I hope that we are not going to

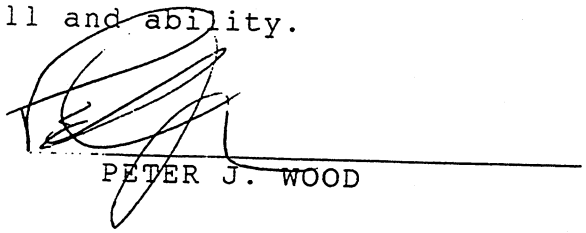
take these business communities' solutions for how they want to increase the livability or their bottom line. It cannot equate with quality of life. Massport has not done a good job as a good neighbor. You have the power, you have the authority to tell them, no more, no more. If you can't do that, as they say, no justice, no peace. No justice, no peace. Please, make sure these people live up to what they're supposed to do by taking care of me. Thank you.

THE MODERATOR: Thank you, Mr. Payton. You were under time. I would have allowed you more time. We're not going to borrow time for anybody else. That's one of the ground rules. There being no other people who want to make comments, then I will declare this hearing closed.

(The hearing concluded at 10:15 p.m.)

CERTIFICATE

I, Peter J. Wood, do hereby certify that the foregoing record, Pages 1 through 179, is a complete, accurate, and true transcription of my stenomask tapes taken in the aforementioned matter to the best of my skill and ability.



PETER J. WOOD

THE FOREGOING CERTIFICATION OF THIS TRANSCRIPT DOES NOT APPLY TO ANY REPRODUCTION OF THE SAME BY ANY MEANS UNLESS UNDER THE DIRECT CONTROL AND/OR DIRECTION OF THE CERTIFYING REPORTER.

MA State Representative Bruce Ayers

Code	Topic 1	Topic 2	Comment	Response
T1.01.1	Regional Transportation	Regional Airports	...they [Massport] have not fully examined the alternatives to the airport expansion like Hanscom Field and Worcester Airport; (whereas), other transportation accesses like regional airports Green in Rhode Island and Manchester in New Hampshire;....	Chapter 2 of the Supplemental DEIS/FEIR provides a discussion of the specific role played by the regional transportation alternatives and steps that Massport has taken to foster use of these alternatives. Massport has long recognized and has been a proponent of options to Logan Airport. Together with the regional airports, Massport has implemented a regional strategy to enhance the use of options to Logan Airport. In the Draft EIS/EIR, Massport identified up to 7.3 million annual passengers that could be absorbed by regional alternatives that include use of T.F. Green/Providence, Manchester and Worcester Regional airports, as well as the new high-speed rail to New York. In the Supplemental DEIS/FEIR, Massport recognizes that these developments will slow Logan Airport's passenger traffic growth. Logan Airport may not achieve the 37.5 million passenger forecasts until after 2010, but rather closer to 2015, and the 45 million passenger forecasts may not be achieved until after 2020. While regional alternatives can play an important role in reducing the rate of future traffic growth at Logan Airport, they do not address Logan Airport's inability to efficiently accommodate current levels of demand during northwest wind conditions. Runway 14/32, which is designed to correct the problem with Logan Airport's layout, is necessary to correct this deficiency and provides clear benefits at current aircraft traffic levels. These benefits will only increase in the future, even as developments at the regional airports act to reduce the rate of future growth at Logan Airport.
T1.01.2	Alternatives	Peak Period Pricing	...other management tools that could be used to alleviate delays such as peak period management programs;....	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR contain an analysis of PPP as a demand management alternative at Logan Airport. The analysis indicates that PPP is an effective option when airlines schedule beyond the normal hourly operating capacity of the airport. See Section 4.5 of the Supplemental DEIS/FEIR.

Code	Topic 1	Topic 2	Comment	Response
T1.01.3	Noise	Runway Use	...operation of the new runway would severely impact several neighborhoods in my district in the city of Quincy, especially Squantum, West Quincy, North Quincy, Montclair, Houghes Neck, Merrymount, Wollaston.	In 1998, 77 percent of Logan Airport's jet traffic affected communities to the north and south of the airport—East Boston, Winthrop, Revere, parts of South Boston, Dorchester, Quincy, Milton, and Braintree. Without Runway 14/32, as much as 88 percent of Logan Airport's aircraft operations will overfly these communities when Logan Airport reaches 37.5 million passengers. Construction of Runway 14/32 will allow a more balanced geographic distribution of aircraft operations over populated areas, will increase the number of over-water operations, and will reduce noise exposure for close-in communities. In fact, the most heavily impacted communities will experience a decrease in overflights compared to 1998 levels. With the Preferred Alternative, when Logan Airport reaches 29 million passengers, overflights from Runway 4 arrivals and Runway 22 departures, which affect South Boston, Quincy, Milton, and Braintree, will decrease from 107,861 in 1998 to 58,305 operations. Similarly, overflights affecting Winthrop (Runway 27 arrivals and Runway 9 departures) will decline from 88,224 in 1998 to 55,805. As a result of the relief for these communities, flights over the water and flights over less impacted communities will increase. With Runway 14/32, the over-water procedure (Runway 14 and Runway 15 departures, Runway 32 and Runway 33 arrivals) becomes the most used set of runways with operations increasing from 34,222 in 1998 to 82,965. Overflights affecting the South End, parts of South Boston, and Roxbury (Runway 27 departures) will increase from 20,356 to 41,974, making this the fourth most used procedure, up from fifth in 1998. Overflights affecting Chelsea, the Eagle Hill section of East Boston, Everett, and Somerville (Runway 33 departures and Runway 15 arrivals) will increase from 9,804 to 35,801. This will become the fifth most used procedure, up from the sixth, or least used procedure in 1998. Also refer to Section 4.6 of the Supplemental DEIS/FEIR for a discussion of runway use and to Section 6.2 of the Supplemental DEIS/FEIR for a discussion of noise impacts.

Code	Topic 1	Topic 2	Comment	Response
T1.01.4	Environmental Review Process	Public Process	...Massport has not come out and asked the city of Quincy to have or to hold a public meeting.	There was an extensive public participation and review process during the preparation of the Draft EIS/EIR. Public comments were received on the ENF after it was filed during the summer of 1995. In the fall of 1995, several public scoping sessions were held to provide community input to the subsequent state and federal scopes for the project. To assure that the Airside analysis was conducted with awareness and input from all concerned parties, the Massport Board established the Airside Review Committee (ARC), which consists of the Community Advisory Committee (with representatives from 24 communities surrounding Logan Airport), and 11 businesses and industry organizations. Massport also funded independent consultants for the CAC to provide them with the capacity to professionally assess the analysis and conclusions of the Airside Study. Between 1995 and 1999, Massport held 16 meetings with the ARC, an additional 15 meetings with just the CAC, and several meetings with the CAC consultants. In addition, Massport made 29 presentations to elected officials, most of whom represent Logan Airport's neighboring communities, and Massport held 45 meetings with community and business leaders, reaching an audience of more than 3,000 people. During the public comment period on the Draft EIS/EIR, the FAA held two public hearings. In January 2000, in response to the FAA's review of the Draft EIS, the FAA called for preparation of a Supplemental Draft EIS to address specific issues identified by the FAA following input from a SDEIS Panel consisting of six persons. At the FAA's direction, three SDEIS Panel members were appointed by the Governor of the Commonwealth of Massachusetts and three were appointed by the Mayor of the City of Boston. Under the direction of the New England Region FAA, the SDEIS Panel convened in March of 2000 and then met at least monthly with a final meeting in December of 2000. A total of 12 meetings were held. To provide the appropriate background, the SDEIS Panel was presented with an Interim Supplemental Draft EIS, the Draft EIS/EIR, answers to key letters written by members of the public, concerned agencies and public officials responding to the Draft EIS/EIR, and a series of 15 visual and written presentations from the Project's technical consulting team and other independent industry experts.
T1.01.5	Environmental Review Process	FAA/NEPA	...request that the Federal Aviation Administration withdraw its support for the expansion until these questions [submitted written testimony] are addressed and answered.	Comment noted.

T1.02.1	Alternatives	Runway 14/32	...we don't believe the EIS/EIR looks at all of the total cumulative impacts of building 14/32, and building the center taxiway.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR analyze the environmental impacts of the Airside Project, consistent with established federal and state scoping directives. Appropriate mitigation associated with the Airside Project has also been established. Massport has programs in place to reduce the environmental impacts associated with Logan Airport as a whole. These initiatives are described in the *Logan Airport ESPR* and its updates.
T1.02.2	Alternatives	Runway 14/32	...between the PRAS goals not having been met and with the fact that there's no accountability for meeting these runway objectives, that leads the town to conclude that this is not a good alternative.	Chapter 8 of the Supplemental DEIS/FEIR discusses a PRAS monitoring program designed to provide more information on performance relative to the PRAS goals and more accountability.

Code	Topic 1	Topic 2	Comment	Response
T1.05.1	Ground Transportation	Access to Logan	Massport's environmental impact statement report addresses none of this [traffic]. It is incomplete because it avoids the land side impact of airport growth.	The Preferred Alternative is not expected to lead to an increase in passenger demand, and therefore, it will have no effect on congestion or delays on Boston area highways.

Transcript 1.06 City of Somerville, Thomas Fontacella

Code	Topic 1	Topic 2	Comment	Response
T1.06.1	Land Use	Landside Improvements	...it [the EIS/EIR] is inadequate in one key area...the land side improvements that are proposed for the airport are not coordinated with this document.	The purpose of the Airside Improvements Planning Project is to reduce current and projected levels of airfield congestion and delay and to enhance the safety of aircraft operations at Logan. Massport's proposed landside improvements are planned to enhance the efficiency of passenger processing, and include terminal modernization, as well as roadway, parking and service area improvements. The landside projects will not affect the design or implementation of the Airside Project, which has independent utility, nor will the Airside Project improvements affect the design or implementation of any of the landside projects. All airside and landside projects, where required, will continue to be the subject of separate comprehensive environmental analysis by project proponents in accordance with federal and state regulations. As expressed in the May 7, 1999 EOEA Certificate, Massport's Environmental Planning and Status Report (ESPR, formerly GEIR) process "is expected provide a big picture cumulative impact analysis of Logan operations, impacts and mitigation. It complements the project-specific EIRs," such as this one for the Airside Improvements, "helps to focus the review process of individual EIRs, and ensures that segmented project review does not occur in the context of MEPA review at Logan Airport."

Transcript 1.07
Town of Hull, Phillip E. Lemnios, Town Manager

Code	Topic 1	Topic 2	Comment	Response
T1.07.1	Alternatives	Runway 14/32	The town of Hull is opposed to this runway...an increase of about 50,000 flights over our community if this runway were to be built.	The Supplemental DEIS/FEIR projects that the Preferred Alternative would promote runway use in a manner that is more consistent with annual PRAS goals, and Hull is affected by the use of Runway 33/32 arrivals. The total number of aircraft arriving to the northwest does increase with construction of the runway, but this is due to the PRAS goals more than any other factor. Since the Runway 33 arrivals that impact Hull approach primarily over water, and since Hull is further from the airport than those communities impacted by arrivals to Runway 15L/R, 4L/R, or 22L/R, the PRAS goals call for 42 percent of the equivalent arrivals to operate in this direction. Runway 33 arrivals accounted for approximately 27 percent of the equivalent arrivals in 1998, and since Logan Airport has a limited capacity in this direction, the northwest configuration has been underutilized as demand has increased over the years. Construction of the runway allows better achievement of the agreed-upon PRAS goals, but even with Runway 14/32, the equivalent arrivals in the Runway 33/32 direction never reach the goal of 42 percent under any fleet scenario or alternative.
T1.07.2	Purpose and Need	Delay	The FAA says 3.18 percent, the Department of Transportation has a blended rate of 20-plus percent. Massport, for this particular document, came up with a whole new way of measuring delay...What exactly is the rate of delay? There is nothing in the report that said what is an acceptable rate of delay.	Refer to Section 4.4 of the Supplemental DEIS/FEIR for a discussion on the estimation and modeling of flight delays. It includes a description of FAA and U.S. DOT delay measures and their limitations, an explanation of computer models for estimating flight delays, and historical data on delays at Logan Airport and other major United States airports. The methodology used for the Airside Project includes the effects of constraints at Logan Airport, and produces lower delay estimates than FAA modeling. The FAA approved all the models, which have been validated in previously published studies of Logan Airport. The FAA Technical Center was responsible for the capacity and delay results in the 1992 FAA Capacity Enhancement Report for Logan Airport that concluded the need for Runway 14/32, reduced minimums and taxiway improvements. The Technical Center simulated Logan Airport airfield operations with the RDSIM model and estimated that when activity reached 504,000 annual operations, total delay would exceed 260,000 hours per year. The Airside Project Draft EIS/EIR forecasts delays to increase to 157,500 hours per year when annual operations reach 510,000 with the 29M Low Fleet scenario. The Supplemental DEIS/FEIR compares the FAA Technical Center delay estimates in 1992 with those of the Logan Airside Project estimates. The FAA has concluded that the Airside delays represent "a plausible and conservative estimate...." The FAA consistently rates Logan Airport as one of the most delay prone airports in the United States Logan Airport's estimated annual delay hours are over five times the FAA's 20,000-hour threshold for a severely delayed airport.

Code	Topic 1	Topic 2	Comment	Response
T1.07.3	Purpose and Need	Airport Operations	There's nothing in the report that says how many flights can this facility handle, period. What is the ultimate capacity of this facility?	Airport capacity depends on fleet mix, weather conditions, runway assignments and other factors. The maximum sustainable capacity at Logan Airport uses Runways 4L, 4R & 9 under VFR weather conditions and can handle an average of 120 arrivals and departures per hour. For short periods, the flow may be greater or less than this rate, but the sustainable capacity does not exceed 120 operations per hour. Proposed airside improvements, including Runway 14/32 and reduced instrument approach minimums, are intended to increase the flexibility of available configurations in various operating directions, which can better meet this existing level of demand.
T1.07.4	Purpose and Need	Delay	...there's no discussion in the report as to the causes of delay.	Delays occur when wind or weather conditions require the use of configurations with fewer than three active runways, when poor weather requires increased separation distances between aircraft, or when airlines schedule more flights than Logan Airport can handle. The Airside Project addresses delays from constraints at Logan Airport. Section 1.4 and Appendix C of the Supplemental DEIS/FEIR also contains a detailed discussion of the FAA and U.S. DOT delay measures and historical data, along with comparisons of Logan Airport delays within the context of delays at other United States airports.

T1.08.1	Environmental Review Process	FAA/NEPA, MEPA	...Massport has violated both the spirit and the regulations of the EPA, MEPA, and the FAA, as well as a sense of fair play and environmental justice.	The Secretary of Environmental Affairs found that "...the Draft Environmental Impact Report (DEIR) submitted on this project adequately and properly complies with the Massachusetts Environmental Policy Act...". Refer to the Certificate of the Secretary of Environmental Affairs on the DEIR, dated May 7, 1999. In January 2000, in response to the FAA's review of the Draft EIS, the FAA called for preparation of a Supplemental DEIS to address specific issues identified by the FAA following input from an Panel consisting of six persons. At the FAA's direction, three Panel members were appointed by the Governor of the Commonwealth of Massachusetts and three were appointed by the Mayor of the City of Boston. Under the direction of the New England Region FAA, the Panel convened in March of 2000 and then met at least monthly with a final meeting in December of 2000. A total of 12 meetings were held. To provide the appropriate background, the Panel was presented with an Interim Supplemental Draft EIS, the Draft EIS/EIR, answers to key letters written by members of the public, concerned agencies and public officials responding to the Draft EIS/EIR, and a series of 15 visual and written presentations from the Airside Project's technical consulting team and other independent industry experts.
T1.08.2	Analysis Assumptions/ Methodologies	Base Year	Massport has used outdated and worst case scenario data.... The year 1993 was an aberrant year for Massport.	The projections of future airfield delays at Logan Airport are not based on analysis and modeling of delays which occurred during 1993. The analysis for 1993 was included in the Airside Project Draft EIS/EIR to provide historical perspective to the delay problem at Logan Airport and for use in model calibration. The analysis contained in the Supplemental DEIS/FEIR has been updated to include modeled delay results for 1998 to provide more current context to airfield conditions at Logan Airport. Refer to Section 4.2 of the Supplemental DEIS/FEIR for a description of the delay analysis and discussion of current and future delays at Logan Airport.
T1.08.3	Purpose and Need	Airfield Capacity	One of the things that Massport never does in its study is it never examines Logan Airport itself as it is right now...the real problem is at the airport, and that is the size of the airport...no 5,000-foot unidirection commuter runway can address Logan Airport's overwhelming shortcomings.	Based on simulation modeling, Logan Airport experienced 120,000 hours of runway-related delays in 1998. If no actions are taken, runway-related delays are forecast to grow as high as 333,000 hours under a 37.5M High Fleet scenario. The Preferred Alternative produces immediate and long-term benefits by lowering runway delays by 38,000 hours if it had been in place in 1998, and by as much as 94,000 hours in the future 37.5M High Fleet scenario. Because of the impact of the regional alternatives, the 37.5M High Fleet scenario is not expected to be achieved until 2015. The sooner airside efficiencies are implemented; the more benefits will accrue over time. Section 4.6 of the Supplemental DEIS/FEIR shows that delay reduction benefits increase over time as traffic levels increase.

Code	Topic 1	Topic 2	Comment	Response
T1.08.4	Alternative	Preferred Alternative	...Massport ...[is] inadequately addressing the whole section regarding alternatives and the way they looked at them.	The improvement concepts evaluated in the Airside Project Analysis evolved from prior studies including the FAA's *Logan Capacity Enhancement Plan* (October 1992); the *Logan Runway Incursion Mitigation Plan/Taxiway Relocation Study* (December 1993); the *Logan Final GEIR* (July 1993); and the *Logan Airside Improvements Feasibility Study, Phase 1 Report*, published in July 1995. The FAA evaluated a numerous physical, operational, and administrative concepts for reducing Logan Airport delays in its *Boston Logan International Airport Capacity Enhancement Plan*. The FAA recommended several improvement concepts, including unidirectional Runway 14/32, for further study. These improvement concepts, as well as concepts from other studies, were individually examined by Massport in the *Logan Airside Feasibility Study*, published in July 1995. Based on the Feasibility study, some concepts were rejected and the most promising concepts were combined into the Alternatives considered in the Airside Project Draft EIS/EIR. The alternatives analysis in the Airside Project Draft EIS/EIR is consistent with state and federal scoping directives for the Airside Project. The results of the Airside analysis indicate that alternatives that include unidirectional Runway 14/32 provide the most benefit in terms of delay reduction and ability to achieve PRAS goals.

T1.10.1	Noise	PRAS	The distribution [of noise impacts...is] not a solution.	The goals of the Airside Project are to reduce delay, increase the airport's efficiency, and improve airfield safety in an environmentally responsible manner. Unidirectional Runway 14/32 would also give the controllers considerably more flexibility and allow them to improve achievement of PRAS goals, and redirect many flights to overwater routes. During very high demand periods, the controllers currently have little or no flexibility for runway selection. The addition of Runway 14/32 would be the single most important mechanism to achieve equitable geographic distribution of aircraft operations. Massport and the FAA are committed to the PRAS system and have been making improvements since 1982.
T1.10.2	Air Quality	NAAQS	Where are the 2 1/2 million pounds of pollutants, emissions, toxins going that these aircraft put out into the air every single year?	Emissions from activities at Logan Airport disperse in a variety of ways: heavy particles are likely to return to the ground close to the source, while finer particulate matter is likely to become suspended and transported, depending on meteorological conditions. Likewise, gases can be very stable, or they can be very reactive and undergo numerous chemical changes. In any case, the results of the air quality analysis indicate that the concentrations of pollutants will remain well within the NAAQS.
T1.10.3	Water Quality	Stormwater	To what extent has Massport played a part in the pollution of Boston Harbor...To what extent have they played a part in the chemical de-icing facilities that have been ongoing for decades; where does that go?	Massport water quality monitoring indicates that airfield runoff generally meets applicable water quality standards and that deicing activities have not had an adverse impact on harbor water quality. Results of ongoing water quality monitoring and compliance with applicable discharge permits are reported on annually in the Logan Airport ESPR (previously GEIR) and its Annual Updates. That many of the shellfish beds in the intertidal areas surrounding Logan Airport have recently been reopened to commercial diggers indicates that the airfield is not having an adverse impact on those sensitive aquatic resources.

T1.14.1	Delay	Model	...the number of hours of delays that have been presented to you tonight as 121,000 hours of delay from Massport's modeling...is not supported by the FAA's own figures.	Refer to Section 4.4 of the Supplemental DEIS/FEIR for a discussion on the estimation and modeling of flight delays. It includes a description of FAA and U.S. DOT delay measures and their limitations, an explanation of computer models for estimating flight delays, and historical data on delays at Logan Airport and other major United States airports. The methodology used for the Airside Project includes the effects of constraints at Logan Airport, and produces lower delay estimates than FAA modeling. The FAA approved all the models, which have been validated in previously published studies of Logan Airport. The FAA Technical Center was responsible for the capacity and delay results in the 1992 FAA Capacity Enhancement Report for Logan Airport that concluded the need for Runway 14/32, reduced minimums and taxiway improvements. The Technical Center simulated Logan Airport airfield operations with the RDSIM model and estimated that when activity reached 504,000 annual operations, total delay would exceed 260,000 hours per year. The Airside Project Draft EIS/EIR forecasts delays to increase to 157,500 hours per year when annual operations reach 510,000 with the 29M Low Fleet scenario. The Supplemental DEIS/FEIR compares the FAA Technical Center delay estimates in 1992 with those of the Logan Airside Project estimates. The FAA has concluded that the Airside delays represent "a plausible and conservative estimate...." The FAA consistently rates Logan Airport as one of the most delay prone airports in the United States Logan Airport's estimated annual delay hours are over five times the FAA's 20,000-hour threshold for a severely delayed airport.
T1.14.2	Delay	Model	Within the ten-year period, the number of hours of delay...will overwhelm this airport....	Based on simulation modeling, Logan Airport experienced 120,000 hours of runway-related delays in 1998. If no actions are taken, runway-related delays are forecast to grow as high as 333,000 hours under a 37.5M High Fleet scenario. The Preferred Alternative produces immediate and long-term benefits by lowering runway delays by 38,000 hours if it had been in place in 1998, and by as much as 94,000 hours in the future 37.5M High Fleet scenario. Because of the impact of the regional alternatives, the 37.5M High Fleet scenario is not expected to be achieved until 2015. The sooner airside efficiencies are implemented; the more benefits will accrue over time. Section 4.6 of the Supplemental DEIS/FEIR shows that delay reduction benefits increase over time as traffic levels increase.
T1.14.3	Alternatives	Runway 14/32	Also, if this runway is built, runway 27 will see a dramatic increase in the number of operations... Runway 27 (which) will see a four-fold increase in just departures when runway 14/32 is built.	The Supplemental DEIS/FEIR projects that the Preferred Alternative would promote runway use in a manner that is more consistent with annual PRAS goals. The total number of departures from Runway 27 (over South Boston, Roxbury, and Jamaica Plain) would increase, but the number of equivalent jet operations would remain essentially the same. The difference in these communities would be fewer nighttime operations and more daytime operations but the same noise impacts.

Code	Topic 1	Topic 2	Comment	Response
T1.14.4	Noise	PRAS	With the ...excessive number of operations that are coming into this airport, PRAS goals as they were designed in the early '70s will never be achieved....	During very high demand periods, the controllers have little or no flexibility for runway selection and PRAS recommends an appropriate runway configuration given the extant demand. Unidirectional Runway 14/32 would give the controllers considerably more flexibility and allow them to improve achievement of PRAS goals. The Supplemental DEIS/FEIR demonstrates that the controllers have been improving performance with respect to PRAS recommendations. Section 8.5 of the Supplemental DEIS/FEIR contains methods for more comprehensive monitoring of PRAS. These methods will be implemented as part of the mitigation program for the Airside Project.
T1.14.5	Alternatives	Taxiway Improvements	...the center field taxiway is going to be a conduser to have more operations on the north-south runways because you're going to be able to get the aircraft off and on to these runways in a much quicker fashion.	The taxiway improvements are designed to improve ground movement efficiency and safety, and to reduce taxiing delays; thereby reducing associated noise and emissions. When using Runways 22L/R for departures, the Centerfield Taxiway would provide an alternate taxi route for Runway 22L departures to bypass the queue for Runway 22R, thereby reducing taxiway congestion and associated noise and emissions. Runway 22L departures represent less than ten percent of the total departures. Under existing conditions, aircraft needing to depart on Runway 22L (typically heavy jets, such as 747s with long takeoff distance requirements) must wait in the queue on Taxiway November with aircraft departing on Runway 22R. With the Centerfield Taxiway, aircraft departing on Runway 22L could depart quickly after reaching the runway end, and the number of aircraft queuing on Taxiway November should decline. Also, the aircraft on the Taxiway November should be smaller, implying lower noise and air quality emissions. With the addition of Runway 14/32, use of Runways 22R and 22L for departures would decline.
T1.14.6	Regional Transportation	Regional Airports	...more airports would be beneficial, more regional airports with a greater number of operations so that there was a more equitable and environmentally-justifiable operation.	Chapter 2 of the Supplemental DEIS/FEIR provides a discussion of the specific role played by the regional transportation alternatives and steps that Massport has taken to foster use of these alternatives. Massport has long recognized and has been a proponent of options to Logan Airport. Together with the regional airports, Massport has implemented a regional strategy to enhance the use of options to Logan Airport. In the Draft EIS/EIR, Massport identified up to 7.3 million annual passengers that could be absorbed by regional alternatives that include use of T.F. Green/Providence, Manchester and Worcester Regional airports, as well as the new high-speed rail to New York. In the Supplemental DEIS/FEIR, Massport recognizes that these developments will slow Logan Airport's passenger traffic growth. Logan Airport may not achieve the 37.5 million passenger forecasts until after 2010, but rather closer to 2015, and the 45 million passenger forecasts may not be achieved until after 2020. While regional alternatives can play an important role in reducing the rate of future traffic growth at Logan Airport, they do not address Logan Airport's inability to efficiently accommodate current levels of demand during northwest wind conditions. Runway 14/32, which is designed to correct the problem with Logan Airport's layout, is necessary to correct this deficiency and provides clear benefits at current aircraft traffic levels. These benefits will only increase in the future, even as developments at the regional airports act to reduce the rate of future growth at Logan Airport.

T1.17.1	Regional Transportation	Passenger Rail	The appropriate authorities...[and] also the Commonwealth of Massachusetts and the federal government, should be...addressing those regional [transportation] problems, whether they're addressing it [them] through high-speed rail, commuter rail, [and] also through the tremendous growth we've seen at Manchester, New Hampshire and Green in Rhode Island.	Chapter 2 of the Supplemental DEIS/FEIR provides a discussion of the specific role played by the regional transportation alternatives and steps that Massport has taken to foster use of these alternatives. Massport has long recognized and has been a proponent of options to Logan Airport. Together with the regional airports, Massport has implemented a regional strategy to enhance the use of options to Logan Airport. In the Draft EIS/EIR, Massport identified up to 7.3 million annual passengers that could be absorbed by regional alternatives that include use of T.F. Green/Providence, Manchester and Worcester Regional airports, as well as the new high-speed rail to New York. In the Supplemental DEIS/FEIR, Massport recognizes that these developments will slow Logan Airport's passenger traffic growth. Logan Airport may not achieve the 37.5 million passenger forecasts until after 2010, but rather closer to 2015, and the 45 million passenger forecasts may not be achieved until after 2020. While regional alternatives can play an important role in reducing the rate of future traffic growth at Logan Airport, they do not address Logan Airport's inability to efficiently accommodate current levels of demand during northwest wind conditions. Runway 14/32, which is designed to correct the problem with Logan Airport's layout, is necessary to correct this deficiency and provides clear benefits at current aircraft traffic levels. These benefits will only increase in the future, even as developments at the regional airports act to reduce the rate of future growth at Logan Airport.
T1.17.2	Air Quality	Impacts	A plane that lands or takes off on time does not add avoidable pollution because they do not sit on the runway while waiting to take off, or they do not circle the city waiting to land.	Comment noted.
T1.17.3	Noise	Impacts	...the noise pollution that's happened to a lot of these communities is going to be more equally distributed, and many of those flights will be pushed over the water.	The goals of the Airside Project are to reduce delay, increase the airport's efficiency, and improve airfield safety in an environmentally responsible manner. Unidirectional Runway 14/32 would also give the controllers considerably more flexibility and allow them to improve achievement of PRAS goals, and redirect many flights to overwater routes. During very high demand periods, the controllers currently have little or no flexibility for runway selection. The addition of Runway 14/32 would be the single most important mechanism to achieve equitable geographic distribution of aircraft operations. Massport and the FAA are committed to the PRAS system and have been making improvements since 1982.

Code	Topic 1	Topic 2	Comment	Response
T1.18.1	Environmental Review Process	MEPA	This draft EIS is inconsistent with both the letter and the spirit of the Environmental Policy Act. In fact, it has failed to comply with MEPA.	The Secretary of Environmental Affairs found that "...the Draft Environmental Impact Report (DEIR) submitted on this project adequately and properly complies with the Massachusetts Environmental Policy Act...". Refer to the Certificate of the Secretary of Environmental Affairs on the DEIR, dated May 7, 1999.
T1.18.2	Noise	Runway Use	In 1993, the FAA said Logan was the sixth noisiest airport in the country. Where is that in this report?	The source of the comment is unknown. It is not mentioned in the Supplemental DEIS/FEIR.
T1.18.3	Noise	Model	...the information on environmental impact fails to assess those impacts adequately or accurately because the modeling is flawed.... The monitoring of those impacts is also inadequate...but...it's not reflected in [the EIS/EIR]...This report does not do what MEPA requires Massport to do.	Differences between measured and modeled sound levels have been reported in Logan Airport's various GEIRs and Annual Updates for a number of years. Differences at close-in locations were significantly reduced in 1996 through modification of source levels to better account for over-water sound propagation and apparent use of higher engine power settings than are normally assumed in the noise model's database (Refer to Appendix F of the *Logan Airport 1996 Annual Update).* In 1998, differences between measured and modeled noise became even less when Massport upgraded its monitoring system and began to report noise caused only by aircraft -- a metric directly comparable to the DNL exposure levels predicted by the noise model. At sites having exposure levels of 60 dB or more, this improvement to the monitoring system brought measured and modeled DNL values to within 0.2 dB of each other. (Refer to Chapter 6 of the *Logan Airport 1999 Environmental Planning and Status Report*). Massport continues to investigate possible causes for remaining differences (such as from hill effects) but believes the FAA's INM noise model used in the Airside Project noise analyses accurately represents expected noise exposure. The Secretary of Environmental Affairs found that "...the Draft Environmental Impact Report (DEIR) submitted on this project adequately and properly complies with the Massachusetts Environmental Policy Act...". Refer to the Certificate of the Secretary of Environmental Affairs on the DEIR, dated May 7, 1999.

Code	Topic 1	Topic 2	Comment	Response
T1.18.4	Alternatives	Other Non-Construction Alternatives	...the alternatives are straw men, [and]...[the] no-action alternative...is not an alternative for the communities.	The improvement concepts evaluated in the Airside Project Analysis evolved from prior studies including the FAA's *Logan Capacity Enhancement Plan* (October 1992); the *Logan Runway Incursion Mitigation Plan/Taxiway Relocation Study* (December 1993); the *Logan Final GEIR* (July 1993); and the *Logan Airside Improvements Feasibility Study, Phase 1 Report*, published in July 1995. The FAA evaluated a numerous physical, operational, and administrative concepts for reducing Logan Airport delays in its *Boston Logan International Airport Capacity Enhancement Plan.* The FAA recommended several improvement concepts, including unidirectional Runway 14/32, for further study. These improvement concepts, as well as concepts from other studies, were individually examined by Massport in the *Logan Airside Feasibility Study*, published in July 1995. Based on the Feasibility study, some concepts were rejected and the most promising concepts were combined into the Alternatives considered in the Airside Project Draft EIS/EIR. The alternatives analysis in the Airside Project Draft EIS/EIR is consistent with state and federal scoping directives for the Airside Project. The results of the Airside analysis indicate that alternatives that include unidirectional Runway 14/32 provide the most benefit in terms of delay reduction and ability to achieve PRAS goals.
T1.18.5	Environmental Justice	Demographic Data	...The environmental justice analysis...[is] unreliable because it flows from faulty data.	The Environmental Justice analysis was expanded for the Supplemental DEIS/FEIR. Low-income and minority populations were defined in accordance with Federal Executive Order 12898, the U.S. DOT Final Order, and the Council on Environmental Quality's guidance on environmental justice. In addition, the analysis of low-income populations was expanded to include households at 150 percent of poverty level. This analysis found that there is no high and adverse disproportionate impact to low-income and minority populations caused by the Preferred Alternative. Adverse impacts are not predominately borne by low-income or minority populations. Only 21 percent of the population within the 65 dB DNL contour for the Preferred Alternative is minority, compared to the Suffolk County minority population of 38 percent. Less than two percent of the population within the 65 dB DNL contour for the Preferred Alternative has a household income less than 150 percent of poverty level. The additional area within the 65 dB DNL noise contour associated with the Preferred Alternative includes a predominately Hispanic neighborhood in Chelsea which is predicted under worst case assumptions to experience an increase of 0.6 dB or less. Under FAA standards, this change is not a significant adverse impact. The minority and low-income populations in South Boston and East Boston affected by the Preferred Alternative 65 dB DNL contour are almost identical to the No Action Alternative. The 65 dB DNL contour for the Preferred Alternative does not extend into Jamaica Plain, Roxbury and the South End. Mitigation of the increased noise within the 65 dB DNL contour will be provided to affected communities in the form of residential sound insulation. A discussion of the Environmental Justice analysis is presented in Section 6.8 of Supplemental DEIS/FEIR.
T1.18.6	Noise	Impacts	...In the GEIS [it states] that on landing and takeoff, stage 3 aircraft are noisy and that cannot be remedied, and these [affected] communities have to live with landing and takeoff.	While communities near Logan Airport will never be free of aircraft noise, Massport is committed to investigating legal and effective means of reducing exposure in all of the most highly exposed areas around the airport.

Code	Topic 1	Topic 2	Comment	Response
T1.18.7	Noise	Model	...one noise monitor was out of commission for two years...What does that do to the accuracy of the environmental impact data? Their modeling is therefore unreliable.	Differences between measured and modeled sound levels have been reported in Logan Airport's various GEIRs and Annual Updates for a number of years. Differences at close-in locations were significantly reduced in 1996 through modification of source levels to better account for over-water sound propagation and apparent use of higher engine power settings than are normally assumed in the noise model's database (Refer to Appendix F of the *Logan Airport 1996 Annual Update).* In 1998, differences between measured and modeled noise became even less when Massport upgraded its monitoring system and began to report noise caused only by aircraft – a metric directly comparable to the DNL exposure levels predicted by the noise model. At sites having exposure levels of 60 dB or more, this improvement to the monitoring system brought measured and modeled DNL values to within 0.2 dB of each other. (Refer to Chapter 6 of the *Logan Airport 1999 Environmental Planning and Status Report*). Massport continues to investigate possible causes for remaining differences (such as from hill effects) but believes the FAA's INM noise model used in the Airside Project noise analyses accurately represents expected noise exposure.

T1.22.1	Noise	Impacts	...Any attempt to measure noise by decibels entirely misses the point that noise is not mere sound but sound as it is experienced by a living human being.	Decibels, and especially A-weighted decibels and DNL levels used throughout this document, have been specifically designed to reflect human response to noise.
T1.22.2	Environmental Review Process	MEPA	Some of Massport's EIR is not completely accurate or satisfactory. I urge you therefore to refuse their request to go ahead with this unfair and injurious scheme to inflict even more suffering and hardship on communities that already endure a disproportionate burden of noise, air pollution, and traffic.	The Secretary of Environmental Affairs found that "...the Draft Environmental Impact Report (DEIR) submitted on this project adequately and properly complies with the Massachusetts Environmental Policy Act...". Refer to the Certificate of the Secretary of Environmental Affairs on the DEIR, dated May 7, 1999.

T1.23.1	Ground Transportation	Access to Logan	...flights and our passengers coming to Boston [will increase] by about 3.4 percent a year. ...once those people get here, what happens to them...[there is] serious congestion on the ground already....	Implementation of the Preferred Alternative would not increase capacity, but rather it would correct a series of deficiencies in the airfield geometry and operation. Massport's plans to handle the ground access requirements of future passenger levels are discussed in the *Logan Airport 1999 ESPR* (previously GEIR) and its subsequent Environmental Data Reports (Annual Updates).
T1.23.2	Regional Transportation	Regional Airports	If...the runway is built, I am concerned that we're not going to see the follow-up on the regionalization because regionalization was not discussed prior to this....	Chapter 2 of the Supplemental DEIS/FEIR provides a discussion of the specific role played by the regional transportation alternatives and steps that Massport has taken to foster use of these alternatives. Massport has long recognized and has been a proponent of options to Logan Airport. Together with the regional airports, Massport has implemented a regional strategy to enhance the use of options to Logan Airport. In the Draft EIS/EIR, Massport identified up to 7.3 million annual passengers that could be absorbed by regional alternatives that include use of T.F. Green/Providence, Manchester and Worcester Regional airports, as well as the new high-speed rail to New York. In the Supplemental DEIS/FEIR, Massport recognizes that these developments will slow Logan Airport's passenger traffic growth. Logan Airport may not achieve the 37.5 million passenger forecasts until after 2010, but rather closer to 2015, and the 45 million passenger forecasts may not be achieved until after 2020. While regional alternatives can play an important role in reducing the rate of future traffic growth at Logan Airport, they do not address Logan Airport's inability to efficiently accommodate current levels of demand during northwest wind conditions. Runway 14/32, which is designed to correct the problem with Logan Airport's layout, is necessary to correct this deficiency and provides clear benefits at current aircraft traffic levels. These benefits will only increase in the future, even as developments at the regional airports act to reduce the rate of future growth at Logan Airport.0
T1.23.3	Environmental Review Process	Public Process	We are very concerned about the...lack of faith involved when the Community Advisory Council was removed from the discussion process for 20 months.	Comment noted.

T1.23.2	Regional Transportation	Regional Airports	If...the runway is built, I am concerned that we're not going to see the follow-up on the regionalization because regionalization was not discussed prior to this....	Logan Airport is part of a regional system of airports that includes T.F. Green/Providence, Worcester Regional and Manchester airports. Massport has long recognized that service development and increased passenger traffic at these airports are an important part of the region's long-term strategy to accommodate passenger and activity growth. Massport has actively encouraged the development of regional airports and use of other options, including high-speed rail to Logan Airport's largest market, New York. Regional service was examined in Chapter 2 of the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR. This analysis supports the conclusion that greater use of the regional airports will provide passengers within the service area of such airports with a viable alternative to Logan Airport. Since demand within Logan Airport's primary service area will remain strong, the improvements at other regional airports will not eliminate the need for airside projects at Logan Airport. Chapter 2 of the Supplemental DEIS/FEIR provides a discussion of the specific role played by the regional transportation alternatives and steps that Massport has taken to foster use of these alternatives. Massport has long recognized and has been a proponent of options to Logan Airport. Together with the regional airports, Massport has implemented a regional strategy to enhance the use of options to Logan Airport. In the Draft EIS/EIR, Massport identified up to 7.3 million annual passengers that could be absorbed by regional alternatives that include use of T.F. Green/Providence, Manchester and Worcester Regional airports, as well as the new high-speed rail to New York. In the Supplemental DEIS/FEIR, Massport recognizes that these developments will slow Logan Airport's passenger traffic growth. Logan Airport may not achieve the 37.5 million passenger forecasts until after 2010, but rather closer to 2015, and the 45 million passenger forecasts may not be achieved until after 2020. While regional alternatives can play an important role in reducing the rate of future traffic growth at Logan Airport, they do not address Logan Airport's inability to efficiently accommodate current levels of demand during northwest wind conditions. Runway 14/32, which is designed to correct the problem with Logan Airport's layout, is necessary to correct this deficiency and provides clear benefits at current aircraft traffic levels. These benefits will only increase in the future, even as developments at the regional airports act to reduce the rate of future growth at Logan Airport.0

T1.25.1	Noise	Runway Use	A 300 percent-plus air traffic increase that Somerville would suffer if runway 14/32 is built is also dismissed by Massport as negligible...However...We [Somerville residents] know that any semblance of peace that remains for us with the use of the present flight pattern will be almost totaliy obliterated by the tripling of the impact that we endure already.	The Day-Night Sound Level values in Somerville are less than 60 dB for the future scenarios. The Supplemental DEIS/FEIR projects that the Preferred Alternative would promote runway use in a manner that is more consistent with annual PRAS goals, and Somerville is affected most by Runway 33 departures and Runway 15 arrivals. Total departures from Runway 33L and arrivals to Runway 15R would increase, but many of these are non-jets. These runway operating directions are currently running well below their PRAS goals, and the unidirectional Runway 14/32 would allow the controllers to approach but still remain below the annual goals for these operations. The PRAS goals were established based on a thorough public participation process in response to community noise concerns. Additionally, by increasing the number of operations over water, Runway 14/32 would reduce the total annual hours of dwell and persistence over populated areas in accordance with short-term PRAS goals.

T1.27.1	Environmental Review Process	Public Process	...other communities are being lobbied to support this project without having the process that they should have...there needs to be a balanced representation from our community [Nantucket].	There was an extensive public participation and review process during the preparation of the Draft EIS/EIR. Public comments were received on the ENF after it was filed during the summer of 1995. In the fall of 1995, several public scoping sessions were held to provide community input to the subsequent state and federal scopes for the project. To assure that the Airside analysis was conducted with awareness and input from all concerned parties, the Massport Board established the Airside Review Committee (ARC), which consists of the Community Advisory Committee (with representatives from 24 communities surrounding Logan Airport), and 11 businesses and industry organizations. Massport also funded independent consultants for the CAC to provide them with the capacity to professionally assess the analysis and conclusions of the Airside Study. Between 1995 and 1999, Massport held 16 meetings with the ARC, an additional 15 meetings with just the CAC, and several meetings with the CAC consultants. In addition, Massport made 29 presentations to elected officials, most of whom represent Logan Airport's neighboring communities, and Massport held 45 meetings with community and business leaders, reaching an audience of more than 3,000 people. During the public comment period on the Draft EIS/EIR, the FAA held two public hearings. In January 2000, in response to the FAA's review of the Draft EIS, the FAA called for preparation of a Supplemental Draft EIS to address specific issues identified by the FAA following input from a SDEIS Panel consisting of six persons. At the FAA's direction, three SDEIS Panel members were appointed by the Governor of the Commonwealth of Massachusetts and three were appointed by the Mayor of the City of Boston. Under the direction of the New England Region FAA, the SDEIS Panel convened in March of 2000 and then met at least monthly with a final meeting in December of 2000. A total of 12 meetings were held. To provide the appropriate background, the SDEIS Panel was presented with an Interim Supplemental Draft EIS, the Draft EIS/EIR, answers to key letters written by members of the public, concerned agencies and public officials responding to the Draft EIS/EIR, and a series of 15 visual and written presentations from the Project's technical consulting team and other independent industry experts.

T1.28.1	Alternatives	Peak Period Pricing	...if this runway is not implemented by you and you decide to consider peak period pricing, we are in jeopardy of losing our service airline which is Cape Air. Our airport is very vital to Provincetown.	Section 4.5 of the Supplemental DEIS/FEIR provides an analysis of a PPP exemption program designed to protect services to small communities that are most reliant on Boston (Logan Airport) for access to the national air transport system. The analysis examines the impact that an exemption program would have on the delay reduction benefits associated with PPP. It concludes that an essential level of air service in the peak period can be exempted from the peak period surcharge without a material impact on the delay reduction benefits. This exemption program includes all the Cape Cod communities currently served by Logan Airport, as well as other small communities in New England.

Code	Topic 1	Topic 2	Comment	Response
T1.29.1	Alternatives	Runway 14/32	...the benefits of the proposed runway, the degree to which it will affect the delay problem are greatly overstated in the reports....	The benefits of Runway 14/32 are significant: (1) It provides a third runway for operations during northwest winds; (2) it reduces total annual delay by 27 to 37 percent (Preferred Alternative vs. the No Action Alternative); (3) it reduces delays during VFR conditions by 47 to 57 percent (Preferred Alternative vs. the No Action Alternative); (4) it allows controllers to separate aircraft of differing size classes during northwest winds; and (5) it increases the controllers' ability to achieve PRAS goals.
T1.29.2	Cumulative Impacts	Socio-economic	...the impacts on the surrounding communities are substantially understated.	The Secretary of Environmental Affairs found that "...the Draft Environmental Impact Report (DEIR) submitted on this project adequately and properly complies with the Massachusetts Environmental Policy Act...". Refer to the Certificate of the Secretary of Environmental Affairs on the DEIR, dated May 7, 1999.
T1.29.3	Noise	Model	Other problems...[that] exist with the report are the use of old data.	The projections of future airfield delays at Logan Airport are not based on analysis and modeling of delays which occurred during 1993. The analysis for 1993 was included in the Airside Project Draft EIS/EIR to provide historical perspective to the delay problem at Logan Airport and for use in model calibration. The analysis contained in the Supplemental DEIS/FEIR has been updated to include modeled delay results for 1998 to provide more current context to airfield conditions at Logan Airport. Refer to Section 4.2 of the Supplemental DEIS/FEIR for a description of the delay analysis and discussion of current and future delays at Logan Airport.
T1.29.4	Regional Transportation	Regional Airports	In terms of alternatives, they haven't been adequately examined. I specifically call attention to the letter that I wrote on behalf of my client, Airport Impact Relief in October of 1997...We did not receive one response to this letter.	The improvement concepts evaluated in the Airside Project Analysis evolved from prior studies including the FAA's *Logan Capacity Enhancement Plan* (October 1992); the *Logan Runway Incursion Mitigation Plan/Taxiway Relocation Study* (December 1993); the *Logan Final GEIR* (July 1993); and the *Logan Airside Improvements Feasibility Study, Phase 1 Report*, published in July 1995. The FAA evaluated a numerous physical, operational, and administrative concepts for reducing Logan Airport delays in its *Boston Logan International Airport Capacity Enhancement Plan.* The FAA recommended several improvement concepts, including unidirectional Runway 14/32, for further study. These improvement concepts, as well as concepts from other studies, were individually examined by Massport in the *Logan Airside Feasibility Study*, published in July 1995. Based on the Feasibility study, some concepts were rejected and the most promising concepts were combined into the Alternatives considered in the Airside Project Draft EIS/EIR. The alternatives analysis in the Airside Project Draft EIS/EIR is consistent with state and federal scoping directives for the Airside Project. The results of the Airside analysis indicate that alternatives that include unidirectional Runway 14/32 provide the most benefit in terms of delay reduction and ability to achieve PRAS goals.

Code	Topic 1	Topic 2	Comment	Response
T1.29.5	Environmental Review Process	Public Process	...under the Airport Act, 49 United States Code, Section 47-106. The interests of the community have not been given fair consideration...Protection and enhancement of the environment, inter-modal planning requirements of federal law, and...Section 47-101 have not been followed.	The extensive analysis in the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR, and related public comment opportunities, demonstrate that Massport and FAA have complied with applicable Federal law requirements. The Final EIS and Federal Record of Decision will make final appropriate findings as required by Federal law.
T1.29.6	Environmental Review Process	MEPA	Given the lack of accurate information and the inadequacies, we ask that the secretary find the report to be inadequate and require a new draft, and we urge the FAA to withdraw its support of this project.	In January 2000, in response to the FAA's review of the Draft EIS, the FAA called for preparation of a Supplemental Draft EIS to address specific issues identified by the FAA following input from a SDEIS Panel consisting of six persons. At the FAA's direction, three SDEIS Panel members were appointed by the Governor of the Commonwealth of Massachusetts and three were appointed by the Mayor of the City of Boston. Under the direction of the New England Region FAA, the SDEIS Panel convened in March of 2000 and then met at least monthly with a final meeting in December of 2000. A total of 12 meetings were held. To provide the appropriate background, the SDEIS Panel was presented with an Interim Supplemental Draft EIS, the Draft EIS/EIR, answers to key letters written by members of the public, concerned agencies and public officials responding to the Draft EIS/EIR, and a series of 15 visual and written presentations from the Project's technical consulting team and other independent industry experts. The Secretary of Environmental Affairs found that "...the Draft Environmental Impact Report (DEIR) submitted on this project adequately and properly complies with the Massachusetts Environmental Policy Act...". Refer to the Certificate of the Secretary of Environmental Affairs on the DEIR, dated May 7, 1999.

T1.32.1	Alternatives	Runway 14/32	...to better satisfy the aims of the National Environmental Policy Act and the Massachusetts Environmental Policy Act, the scope of the EIR/EIS should address the possible future implementation of bi-directional use.	The Runway 14/32 concept under review in the Supplemental DEIS/FEIR allows unidirectional operations only (*i.e.*, all aircraft arrivals would occur over Boston Harbor to the Runway 32 approach and all departures would initiate from the Runway 14 heading out over Boston Harbor). State approval under MEPA and federal approval under NEPA will allow Runway 14/32 to proceed only on a basis consistent with the stated unidirectional limitations. Consistent with any such approvals, Massport will light and stripe Runway 14/32 to accommodate unidirectional operations only. Furthermore, the location of proposed Runway 14/32 involves physical limitations that reinforce the unidirectional requirements of that improvement concept. The Hyatt Hotel and Conference Center, which is 174 feet high, is within 1,300 feet of the Runway 14. The location of the Hyatt Hotel and Conference Center invades applicable FAA approach surface glide slope requirements, thereby precluding arrivals from the west to the Runway 14. Another factor limiting westerly operations on Runway 14/32 is the lack of available facilities to allow aircraft to taxi to the Runway 32. The unidirectional limitations of Runway 14/32 allow maximum use of over-water operations and thereby limit operational impacts over residential areas. To strictly reinforce these important environmental benefits, Massport has designated the intended unidirectional limitation on Runway 14/32 as a mitigation measure. Refer to Section 8.7 of the Supplemental DEIS/FEIR Draft Section 61 Findings, and the discussion in Section 8.5 of the Supplemental DEIS/FEIR regarding enforcement of unidirectionality of Runway 14/32.

Code	Topic 1	Topic 2	Comment	Response
T1.33.1	Alternatives	Runway 14/32	Massport's proposal to build runway 14/32 will triple, that is, increase by three-fold overflights to over 45,000 per year...This is intolerable, unreasonable, and unfair. It must not be allowed.	The goals of the Airside Project are to reduce delay, increase the airport's efficiency, and improve airfield safety in an environmentally responsible manner. Unidirectional Runway 14/32 would also give the controllers considerably more flexibility and allow them to improve achievement of PRAS goals, and redirect many flights to overwater routes. During very high demand periods, the controllers currently have little or no flexibility for runway selection. The addition of Runway 14/32 would be the single most important mechanism to achieve equitable geographic distribution of aircraft operations. Massport and the FAA are committed to the PRAS system and have been making improvements since 1982.
T1.33.2	Alternatives	Runway 14/32	Massport has not adequately addressed ...[why] the quality of life of 35,000 residents in Roslindale, the tens of thousands of visitors to the Arnold Arboretum...or the hundreds of thousands of residents of urban Boston and surrounding communities must decline.	The Supplemental DEIS/FEIR contains additional analysis of the project relative to parklands. As depicted in Figure 6.3-4 of the Supplemental DEIS/FEIR, the Arnold Arboretum, Emerald Necklace, and Franklin Park are well outside the 65 dB DNL noise contour associated with the Preferred Alternative. Therefore, the Airside Project will have no impact on these parklands. In addition, the Boston Harbor Islands, while within the No Action Alternative 65 dB DNL noise contour, will have no noise increase under the Preferred Alternative. Refer to Section 6.3 of the Supplemental DEIS/FEIR for additional discussion of parklands.
T1.33.3	Noise	Impacts	Part of the problem is that the pilots never follow through on the runway 27 pattern. Instead of staying over Franklin Park or Forest Hills Cemetery, they get off over the Arboretum and Roslindale. Massport must fix this problem.	Since the new departure procedure was implemented in accordance with the *Runway 27 EIS*, Massport and the FAA have been monitoring and analyzing aircraft flight track data for compliance and to determine the need for changes to achieve the objectives. Pilots are responsible for knowing and complying with noise abatement procedures unless otherwise instructed. As more aircraft are equipped with GPS navigation, compliance should improve.
T1.33.4	Regional Transportation	Regional Airports	...we want Massport...to end the continued growth of this very badly-located airport, and truly shift traffic to other airports including Hanscom.	Massport has no jurisdiction over the development, operation or use of infrastructure at airports other than Logan Airport, Hanscom Field, and Worcester Regional Airport (as of January 15, 2000). Massport plays no role, however, in the decisions of private airlines regarding air service routes or service levels. As proprietor of Logan Airport, Massport's primary responsibility is to supply, operate, and maintain Logan Airport's infrastructure which includes the runways, taxiways, terminal buildings, parking facilities and access roads. As a recipient of federal airport grants, Massport must adhere to grant covenants that require it to operate Logan Airport in such a way so as to ensure access and availability for public use on fair and reasonable terms and without unjust discrimination.

Code	Topic 1	Topic 2	Comment	Response
T1.35.1	Alternatives	Runway 14/32	In regard to runway 14/32, I am opposed to it. If it's turned on, it will produce a tremendous increase in noise pollution which will exacerbate the already 60-second interval of planes that occur overhead on certain days.	Implementation of Runway 14/32 would not result in substantial noise impacts in any community. Rather, it would enable the air traffic controllers to adhere more closely to the PRAS goals and decrease the population that is most severely affected. For example, implementation of the Preferred Alternative will reduce the population affected by Day-Night Sound Level values greater than 70 dB by four percent with the 29 M Low Fleet scenario, by 67 percent with the 37.5 M High Fleet scenario, and by 39 percent with the High Regional Jet Fleet, while increasing the population exposed to Day-Night Sound Level values greater than 65 dB by two percent, zero percent, and three percent for these three fleet scenarios, respectively. Refer to Section 6.2.5 of the Supplemental DEIS/FEIR and population counts presented in Tables 6.2-3 through 6.2-8 of the Supplemental DEIS/FEIR.

Code	Topic 1	Topic 2	Comment	Response
T1.35.2	Regional Transportation	Regional Airports	...a tri-state organization, Rhode Island, New Hampshire, and Massachusetts, initiated by Massport should consider Hanscom as a strong candidate, Worcester, Green, Manchester airports.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR, specifically considered the role of Hanscom Field in the analysis of regional alternatives. Hanscom Field, which serves as a general aviation reliever airport to Logan Airport, already accommodates a significant number of aircraft operations (183,000 operations in 1998). The Hanscom Field activity includes private, business, charter, and air taxi operations that might otherwise use Logan Airport. Since the Airside Project Draft EIS/EIR was filed, Shuttle America, a newly founded airline, began commercial scheduled operations at Hanscom Field, offering limited turboprop services to short-haul regional markets – Trenton, Buffalo, Hartford (discontinued), Wilmington, Delaware (discontinued), and Greensboro. Shuttle America is also conducting operations between Hanscom and New York LaGuardia Airport. While Massport supports commercial service at Hanscom Field consistent with its established limits (60 seat regulation), Massport believes that Hanscom Field will maintain its role as a major general aviation reliever, and that its geographic proximity to Logan, Worcester Regional and Manchester airports will prevent its development as a significant commercial airport. Additionally, commuter airlines serving Logan Airport are unlikely to move a significant number of flights from Logan Airport to Hanscom Field, since approximately 50 percent of passengers on Logan Airport's commuter flights connect to other Logan Airport flights and a significant number of passengers are travelling to Boston. However, any new commercial service initiatives proposed for Hanscom Field shall be reviewed for consistency with the *Hanscom GEIR* (HGEIR) and its Annual Updates, and shall be considered by the Hanscom Area Town Selectmen (HATS). Refer to Section 2.6 of the Supplemental DEIS/FEIR for a discussion of Hanscom Field. Chapter 2 of the Supplemental DEIS/FEIR provides a discussion of the specific role played by the regional transportation alternatives and steps that Massport has taken to foster use of these alternatives. Massport has long recognized and has been a proponent of options to Logan Airport. Together with the regional airports, Massport has implemented a regional strategy to enhance the use of options to Logan Airport. In the Draft EIS/EIR, Massport identified up to 7.3 million annual passengers that could be absorbed by regional alternatives that include use of T.F. Green/Providence, Manchester and Worcester Regional airports, as well as the new high-speed rail to New York. In the Supplemental DEIS/FEIR, Massport recognizes that these developments will slow Logan Airport's passenger traffic growth. Logan Airport may not achieve the 37.5 million passenger forecasts until after 2010, but rather closer to 2015, and the 45 million passenger forecasts may not be achieved until after 2020. While regional alternatives can play an important role in reducing the rate of future traffic growth at Logan Airport, they do not address Logan Airport's inability to efficiently accommodate current levels of demand during northwest wind conditions. Runway 14/32, which is designed to correct the problem with Logan Airport's layout, is necessary to correct this deficiency and provides clear benefits at current aircraft traffic levels. These benefits will only increase in the future, even as developments at the regional airports act to reduce the rate of future growth at Logan Airport.

Code	Topic 1	Topic 2	Comment	Response
T1.35.3	Noise	Impacts	...[Aircraft] fuselage problems making noise could have been corrected [by the manufacturers]...it's not taking place...Massport, in cooperation with the tri-state area, could start that process [of forcing aircraft manufacturers to correct fuselage noise problems].	The FAA has preemptive rule-making authority for quieting aircraft at the source. Neither Massport nor any entity other than the FAA can force manufacturers to comply with noise limits.

Transcript 1.36
Beacon Hill Civic Association, Darryl Pomicter

Code	Topic 1	Topic 2	Comment	Response
T1.36.1	Alternatives	Runway 14/32	...we [the Beacon Hill Civic Association] are against the new runway. This is a short-term partial inferior solution.	Based on simulation modeling, Logan Airport experienced 120,000 hours of runway-related delays in 1998. If no actions are taken, runway-related delays are forecast to grow as high as 333,000 hours under a 37.5M High Fleet scenario. The Preferred Alternative produces immediate and long-term benefits by lowering runway delays by 38,000 hours if it had been in place in 1998, and by as much as 94,000 hours in the future 37.5M High Fleet scenario. Because of the impact of the regional alternatives, the 37.5M High Fleet scenario is not expected to be achieved until 2015. The sooner airside efficiencies are implemented; the more benefits will accrue over time. Section 4.6 of the Supplemental DEIS/FEIR shows that delay reduction benefits increase over time as traffic levels increase.
T1.36.2	Alternatives	Runway 14/32	Director Blute keeps talking about the 70,000 flights over the water and the few percentage of PRAS flights that are going to be rearranged...neighborhoods can easily get 50 to 70,000 increased flights even through, 70,000 are initially aimed over water...even if we do do this [build Runway 14/32], 90 percent of the traffic will eventually be forced to use both the north-south runways because there are no limits on operation plans.	While equivalent jet operations increase by more than 50 percent from a 1993 base to the future 37.5M High Fleet scenario if the Preferred Alternative is implemented, the appropriate basis for comparison of the Preferred Alternative is the No Action Alternative. Equivalent jet operations would increase by more than 75 percent over the Preferred Alternative if no action were taken. Despite the increase in equivalent jet operations, the Airside analysis indicates that overall noise impacts decline over time with the elimination of Stage 2 aircraft and the replacement of hushkitted Stage 3 aircraft with non-hushkitted Stage 3 aircraft. By allowing aircraft operations to shift from over-land to over-water routings and by providing greater flexibility in the use of Runways 27 and 33L for takeoff, the Preferred Alternative further reduces the highest noise impacts to the close-in neighboring communities. Furthermore, the Supplemental DEIS/FEIR also demonstrates the more equitable balance of noise impacts among communities surrounding Logan Airport that can be achieved with the Preferred Alternative as opposed to the imbalance that occurs today and would occur in the future if no action is taken.
T1.36.3	Alternatives	Other Non-Construction Alternatives	[Logan's ranking of] Seventeenth [in the U.S.] in passengers means there are fewer than average passengers on an airplane, so if you can get more passengers on the plane, you need fewer planes, and you could cut the delays by working that side of the equation. You need to work both sides of the equation.	Federal constitutional provisions, federal aviation statutes and regulations, and contractual provisions related to Federal Airport Improvement Program grants prevent Massport from any control over airline rates, routes, and schedules. Congress has specifically forbidden airport operators from exercising any discriminatory action against any class of airport users. Major factors in airline competition are frequency of service and number of markets served, and Massport has no ability to force airlines to consolidate or eliminate flights to influence load factor or aircraft size.

Code	Topic 1	Topic 2	Comment	Response
T1.36.4	Purpose and Need	Delay	Massport, in their EIS, details in great detail going from sixth in 1997, to sixth in delays in 1990. They don't talk about the FAA statistics. They mention that 2½ percent, 25 per thousand, they don't mention that that's down from 40 per thousand or almost 40 per thousand in 1992.	The Supplemental DEIS/FEIR contains a discussion of the FAA and DOT delay measures and historical data, along with comparisons of Logan Airport with other United States airports. The FAA consistently rates Logan Airport as one of the most delay prone airports in the United States Logan Airport's estimated annual delay hours are over five times the FAA's threshold of 20,000 hours for a severely delayed airport. FAA Opsnet delays at Logan Airport peaked in 1993, declined for two years and are rising again. Arrival delays which would be directly affected by Runway 14/32 have risen steadily since 1994.
T1.36.5	Purpose and Need	Delay	The 65 million dollars they say is going to be saved by building this runway, [can be calculated]...The amount of delay hours issue, the percentages have gone up, [and] down...but if you dig into that report, there is a chart where you look at all actions except 14/32 and all actions with 14/32, and the difference is 20,000 hours. It's a 15 percent reduction....	Table 4.5-3 of this Supplemental DEIS/FEIR shows the incremental benefit of Runway 14/32 ranges from 20,000 hours to 86,000 hours, which is a reduction of 19 percent to 27 percent. These are significant benefits. FAA defines 20,000 hours as a severely delayed airport.
T1.36.6	Regional Transportation	Regional Airports	...[If Massport] going to use it [Hanscom Airport]...there's still 40, 50, maybe a hundred thousand dollar operations capacity at Hanscom that they [Massport] have no plans to use.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR, specifically considered the role of Hanscom Field in the analysis of regional alternatives. Hanscom Field, which serves as a general aviation reliever airport to Logan Airport, already accommodates a significant number of aircraft operations (183,000 operations in 1998). The Hanscom Field activity includes private, business, charter, and air taxi operations that might otherwise use Logan Airport. Since the Airside Project Draft EIS/EIR was filed, Shuttle America, a newly founded airline, began commercial scheduled operations at Hanscom Field, offering limited turboprop services to short-haul regional markets – Trenton, Buffalo, Hartford (discontinued), Wilmington, Delaware (discontinued), and Greensboro. Shuttle America is also conducting operations between Hanscom and New York LaGuardia Airport. While Massport supports commercial service at Hanscom Field consistent with its established limits (60 seat regulation), Massport believes that Hanscom Field will maintain its role as a major general aviation reliever, and that its geographic proximity to Logan, Worcester Regional and Manchester airports will prevent its development as a significant commercial airport. Additionally, commuter airlines serving Logan Airport are unlikely to move a significant number of flights from Logan Airport to Hanscom Field, since approximately 50 percent of passengers on Logan Airport's commuter flights connect to other Logan Airport flights and a significant number of passengers are travelling to Boston. However, any new commercial service initiatives proposed for Hanscom Field shall be reviewed for consistency with the *Hanscom GEIR* (HGEIR) and its Annual Updates, and shall be considered by the Hanscom Area Town Selectmen (HATS). Refer to Section 2.6 of the Supplemental DEIS/FEIR for a discussion of Hanscom Field.

T1.37.1	Alternatives	Runway 14/32	I'm here to ask Massport tonight to withdraw their proposal until such time as they can come to my community [Melrose] and explain the impact that this new runway is going to have on my community.	There was an extensive public participation and review process during the preparation of the Draft EIS/EIR. Public comments were received on the ENF after it was filed during the summer of 1995. In the fall of 1995, several public scoping sessions were held to provide community input to the subsequent state and federal scopes for the project. To assure that the Airside analysis was conducted with awareness and input from all concerned parties, the Massport Board established the Airside Review Committee (ARC), which consists of the Community Advisory Committee (with representatives from 24 communities surrounding Logan Airport), and 11 businesses and industry organizations. Massport also funded independent consultants for the CAC to provide them with the capacity to professionally assess the analysis and conclusions of the Airside Study. Between 1995 and 1999, Massport held 16 meetings with the ARC, an additional 15 meetings with just the CAC, and several meetings with the CAC consultants. In addition, Massport made 29 presentations to elected officials, most of whom represent Logan Airport's neighboring communities, and Massport held 45 meetings with community and business leaders, reaching an audience of more than 3,000 people. During the public comment period on the Draft EIS/EIR, the FAA held two public hearings. In January 2000, in response to the FAA's review of the Draft EIS, the FAA called for preparation of a Supplemental Draft EIS to address specific issues identified by the FAA following input from a SDEIS Panel consisting of six persons. At the FAA's direction, three SDEIS Panel members were appointed by the Governor of the Commonwealth of Massachusetts and three were appointed by the Mayor of the City of Boston. Under the direction of the New England Region FAA, the SDEIS Panel convened in March of 2000 and then met at least monthly with a final meeting in December of 2000. A total of 12 meetings were held. To provide the appropriate background, the SDEIS Panel was presented with an Interim Supplemental Draft EIS, the Draft EIS/EIR, answers to key letters written by members of the public, concerned agencies and public officials responding to the Draft EIS/EIR, and a series of 15 visual and written presentations from the Project's technical consulting team and other independent industry experts.
T1.37.2	Noise	Model	Melrose is only five miles away from Logan Airport, yet it isn't considered by Massport to be noise-impacted...They're [jets flying over Melrose] not in the modeling, so I would suggest that they do modeling that doesn't quite reflect the reality of what's really going on up in the skies.	Implementation of Runway 14/32 would not result in substantial noise impacts in any community. Rather, it would enable the air traffic controllers to adhere more closely to the PRAS goals and decrease the population that is most severely affected. For example, implementation of the Preferred Alternative will reduce the population affected by Day-Night Sound Level values greater than 70 dB by four percent with the 29 M Low Fleet scenario, by 67 percent with the 37.5 M High Fleet scenario, and by 39 percent with

T1.38.1	Alternatives	Runway 14/32	I object to the expansion of the runways, unless you want to put it at Hanscom Air Force Base and build an airport there.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR, specifically considered the role of Hanscom Field in the analysis of regional alternatives. Hanscom Field, which serves as a general aviation reliever airport to Logan Airport, already accommodates a significant number of aircraft operations (183,000 operations in 1998). The Hanscom Field activity includes private, business, charter, and air taxi operations that might otherwise use Logan Airport. Since the Airside Project Draft EIS/EIR was filed, Shuttle America, a newly founded airline, began commercial scheduled operations at Hanscom Field, offering limited turboprop services to short-haul regional markets – Trenton, Buffalo, Hartford (discontinued), Wilmington, Delaware (discontinued), and Greensboro. Shuttle America is also conducting operations between Hanscom and New York LaGuardia Airport. While Massport supports commercial service at Hanscom Field consistent with its established limits (60 seat regulation), Massport believes that Hanscom Field will maintain its role as a major general aviation reliever, and that its geographic proximity to Logan, Worcester Regional and Manchester airports will prevent its development as a significant commercial airport. Additionally, commuter airlines serving Logan Airport are unlikely to move a significant number of flights from Logan Airport to Hanscom Field, since approximately 50 percent of passengers on Logan Airport's commuter flights connect to other Logan Airport flights and a significant number of passengers are travelling to Boston. However, any new commercial service initiatives proposed for Hanscom Field shall be reviewed for consistency with the *Hanscom GEIR* (HGEIR) and its Annual Updates, and shall be considered by the Hanscom Area Town Selectmen (HATS). Refer to Section 2.6 of the Supplemental DEIS/FEIR for a discussion of Hanscom Field.
T1.38.2	Alternatives	Preferred Alternative	I think it's a sensible idea to limit any further growth at Logan. It was understood with a court injunction some 25 years ago that it was enough then, it's enough now, and more is not always better.	The Preferred Alternative, and specifically unidirectional Runway 14/32, would not increase Logan Airport's normal airfield capacity of approximately 120 operations per hour. This capacity is available at Logan Airport approximately 80 percent of the time. Runway 14/32 would allow Logan Airport to maintain this capacity during periods of strong northwest winds that now require controllers to operate on only one or two runways, compared to the typical three-runway configurations used at Logan Airport. The runway will not increase Logan Airport's normal operating capacity, nor will it encourage or induce an increase in aircraft operations.

Code	Topic 1	Topic 2	Comment	Response
T1.38.3	Public Health	Effects	We have some serious health considerations to this airport proposal [from noise and air pollution].	The available public health studies for communities adjacent to Logan Airport were reviewed and are presented in Section 6.8 of the Supplemental DEIS/FEIR. Public health status reports were available for the City of Boston; however, comparable public health reports were not available from the Public Health Departments of Chelsea, Revere, and Winthrop. A review of the available information did not indicate any causal relationship based on proximity to the airport, nor did it identify hearing loss as a public health concern. The 1999 Massachusetts budget included $150,000 to fund an environmental assessment of the health impacts of Logan Airport on any community located within a five-mile radius of the airport. The final protocol for the study is being developed. The study is expected to be completed in summer 2002.
T1.38.4	Alternatives	Preferred Alternative	Massport told us tonight it's not expansion but...If you add a runway, it is expansion. I'd like to argue against Massport's claim that it's not.	The Preferred Alternative, and specifically unidirectional Runway 14/32, would not increase Logan Airport's normal airfield capacity of approximately 120 operations per hour. This capacity is available at Logan Airport approximately 80 percent of the time. Runway 14/32 would allow Logan Airport to maintain this capacity during periods of strong northwest winds that now require controllers to operate on only one or two runways, compared to the typical three-runway configurations used at Logan Airport. The runway will not increase Logan Airport's normal operating capacity, nor will it encourage or induce an increase in aircraft operations.

T1.39.1	Regional Transportation	Regional Airports	Now, over in East Boston, in Revere, in Winthrop, 4400 houses are sound-insulated. This new proposal suggests that Chelsea, the poorest city in the state, get 1100 homes sound-insulated. Massport has a choice. They own two airports, Logan and Hanscom. There's a perception that the folks in Lincoln and Lexington and Concord, the affluent and powerful communities, are being spared. There are no houses, no households, in Lincoln or Lexington or Concord or Bedford that we know that are sound-insulated., So where is the fairness and where is the justice?	The Environmental Justice analysis was expanded for the Supplemental DEIS/FEIR. Low-income and minority populations were defined in accordance with Federal Executive Order 12898, the U.S. DOT Final Order, and the Council on Environmental Quality's guidance on environmental justice. In addition, the analysis of low-income populations was expanded to include households at 150 percent of poverty level. This analysis found that there is no high and adverse disproportionate impact to low-income and minority populations caused by the Preferred Alternative. Adverse impacts are not predominately borne by low-income or minority populations. Only 21 percent of the population within the 65 dB DNL contour for the Preferred Alternative is minority, compared to the Suffolk County minority population of 38 percent. Less than two percent of the population within the 65 dB DNL contour for the Preferred Alternative has a household income less than 150 percent of poverty level. The additional area within the 65 dB DNL noise contour associated with the Preferred Alternative includes a predominately Hispanic neighborhood in Chelsea which is predicted under worst case assumptions to experience an increase of 0.6 dB or less. Under FAA standards, this change is not a significant adverse impact. The minority and low-income populations in South Boston and East Boston affected by the Preferred Alternative 65 dB DNL contour are almost identical to the No Action Alternative. The 65 dB DNL contour for the Preferred Alternative does not extend into Jamaica Plain, Roxbury and the South End. Mitigation of the increased noise within the 65 dB DNL contour will be provided to affected communities in the form of residential sound insulation. A discussion of the Environmental Justice analysis is presented in Section 6.8 of Supplemental DEIS/FEIR.

Transcript 1.40 CAC Roxbury Rep., Dovi Abbey

Code	Topic 1	Topic 2	Comment	Response
T1.40.1	Noise	Impacts	...clearly, all of us in the community [Roxbury] minus one or two, we all are unequivocally opposed to runway 14/32...Economic activity is not justification for ...severe disruption of the city, of its inhabitants.	Comment noted.

Transcript 1.41
Private Citizen: Todd L. Payton

Code	Topic 1	Topic 2	Comment	Response
T1.41.1	Environmental Justice	Impacts	...runway 14/32 cannot go through...Under no uncertain circumstances can the communities of color, of Roxbury, which already has 50 to 300 times the disease and death rates, can take another added stressor of noise and air pollution.	Refer to Section 6.8 of the Supplemental DEIS/FEIR for a discussion of the Environmental Justice analysis. Noise was found to be the only adverse impact from the Preferred Alternative with the potential for Environmental Justice impacts. Additional demographic analysis of the noise-affected areas was conducted to determine if minority and/or low-income populations would be disproportionately affected by the Preferred Alternative. This analysis found that there is no high and adverse disproportionate impact caused by the Preferred Alternative.

PROCEEDINGS

THE MODERATOR: Good evening. It's now 6:30. My name is Chris Poreda. I'm a senior attorney for the Federal Aviation Administration's office of the regional counsel in the New England region. I will be the hearing officer for tonight's hearing.

This meeting is jointly sponsored by the Federal Aviation Administration and Massport. I would like to thank the Holiday Inn for allowing us to use these facilities, and I welcome those individuals who are here this evening to listen and make public comment. I also want to welcome the members of the media though I would ask that you remain as unobtrusive as possible while you perform your valuable function to cover this event.

This meeting is being transcribed so each of us who speaks needs to remember to speak clearly, use the microphones, and please identify yourself and spell your last name, if you remember to do so.

Before I introduce those

individuals who will make presentations tonight, I must briefly outline the purpose of the meeting for the record. After those presentations, I'll open the meeting for public comment.

The purpose of this meeting is to receive public comment on proposed airport developments at Logan International Airport. Those proposed developments are detailed in a document published jointly by the Federal Aviation Administration and Massport entitled Logan Air Side Improvements Plan Project dated February 1999. This document serves as both a draft environmental impact statement to meet the procedural requirements of the National Environmental Policy Act, or NEPA, and other federal requirements, and a draft environmental impact report to meet the requirements of the Massachusetts environmental policy act, or MEPA, and other state requirements.

The FAA is the leading federal agency for purposes of the airport layout plan approval and any funding approval which

are federal actions subject to NEPA. Massport is the project proponent for the proposed developments which fall within its purview as the proprietor of Logan International Airport.

The draft EIS/EIR was sent to several elected officials, community leaders, and federal, state, and local government offices. In addition, copies of the document were sent to public libraries in Boston, Brookline, Chelsea, Charlestown, Milton, Quincy, Revere, Somerville, and Winthrop. A notice seeking comment from that document was published in the Federal Register on February the 26th, 1999, and appears on Page 9508 of Volume 64 of the Federal Register.

This evening from the Federal Aviation Administration to my right and the left of me as you look at me is John Silva, environmental programs manager in the airports division of the Federal Aviation Administration's New England region. With us from the Massachusetts Environmental Policy Act office on my left, my right as you look

at me, is Jay Wickersham and Arthur Pugsley. On my far right to the left of the room in the front from Massport we have Betty Desrosiers, director of planning and development, Deborah Meehan, project manager from SH&E, a consultant to Massport on these projects, and David Hollander, a planner for SH&E. The fourth individual who isn't there right now is Flavio Leo. He's the director of aviation planning for Massport.

At this point I will introduce John Silva, and he will make a brief statement. John.

MR. SILVA: Good evening. My name is John Silva and I'm manager of environmental programs, airports division, New England region, Federal Aviation Administration. I'm FAA's project manager for this environmental impact statement. The hearing this evening is being conducted to meet the requirements for public input under Council on Environmental Quality regulations and the Airport and Airway Improvement Act as amended and recodified.

In addition to the opportunity to provide comments this evening, the written comment period on the draft environmental impact statement and draft environmental impact report will remain open through April the 23rd, 1999. Comments may be mailed to me, John Silva, S-I-L-V-A, and I'm going to give you my address now. It's Airports Division, FAA, New England Region, 12 New England Executive Park in Burlington, Massachusetts, and the zip is 01083.

Alternatively, you may mail comments to the Secretary of Environmental Affairs and Arthur or Jay will have an address for you in a minute. That's about all I have to say.

THE MODERATOR: Thank you, John. Now we'll hear from the Massachusetts Environmental Policy Act office.

MR. WICKERSHAM: Thank you, Chris. I'm Jay Wickersham from the MEPA office in the Executive Office of Environmental Affairs. With me is Arthur Pugsley who is the MEPA analyst who is assigned to this

project. The purpose of this report under the MEPA statute is to study the adequacy of the draft environmental impact report which has been filed by Massport, and to review whether Massport has taken all feasible steps to avoid, minimize, or mitigate the environmental impacts of this project.

We will be reviewing the adequacy of the draft EIR consistent with the MEPA regulations which are found at 301 CMR 11, and also consistent with the scope for the EIR which was issued by Secretary Cox in November of 1995, and you can find this scope at the front of Volume 2 of the draft EIR.

In addition to the spoken comments tonight, we are also taking written comments. You can put them in the box here at the end of the table after you've spoken or you can mail them to the MEPA office. The address for mailing those comments is Executive Office of Environmental Affairs, 100 Cambridge Street, 20th Floor, Boston, Massachusetts, 02202, Attention, Arthur Pugsley, P-U-G-S-L-E-Y, and we ask that you

put the EOEA file number on each piece of correspondence. That file number is 10458. Again, EOEA file number 10458. Thank you. Also, the comment deadline for MEPA is the same as for the FAA, and that is that we are receiving written comments until 5 p.m. on Friday, April 23rd. That is two weeks from tomorrow. Thank you.

THE MODERATOR: Thank you, Jay. At this point, let me, as a verbal footnote, note that although I am also an employee of the Federal Aviation Administration, my role here tonight is strictly as moderator, and I will play no role in the determination of this draft or the final report or review of the comments. My job here is to give everybody, supporters and opponents alike, a fair opportunity to comment and I will endeavor to do so.

At this point, we'll have a brief presentation from Betty Desrosiers of Massport, but before she starts I would like to remind everyone again that if you wish to speak, please sign up on the sign-up lists in

the lobby. I will be recognizing people to speak from those lists so while Betty is speaking if you haven't signed up and wish to speak, please go out to the lobby and sign up. Betty.

MS. DESROSIERS: Thank you and good evening. Over the last three months, Peter Blute, Tom Kenton, and I have attended over 45 public forums to talk about the air side improvement program that is presently before the state and federal environmental regulatory agencies. We have addressed nearly 3,500 people about this project and we have listened very carefully to what people have to say at each of those forums and we'll do so again this evening.

I want to thank you for giving me the opportunity to take 15 minutes of your time this evening to do an overview of the project. Let me say that for those of you who have seen this presentation by Massport before, this one's a little bit different and certainly much shorter so thank you for bearing with me. Let's begin.

The presentation is really in three parts. It first talks about the airport in terms of its economic and regional transportation role. I then will describe the project as it is presented to the environmental agencies and highlight the key environmental results of the analysis.

First, Logan Airport is a key economic engine for Massachusetts and New England. The airport itself employs 15,000 people and contributes 5 billion dollars to the regional economy.

Next slide. A survey of Boston area businesses indicate that today 79 percent of the Boston area businesses rely on a safe and convenient airport to do their business, and indeed that same survey has shown that the high growth industry in the greater Boston area expect their reliance of convenient and safe air service to increase in the future. In particular, businesses such as communications, high technology, management services, all expect that they will continue to see their reliance grow at

Logan Airport.

There are several kind of indices of delay. Does Logan Airport have a delay problem? We certainly do have a delay problem. There are many measures of delay. The two that are up here, one by the U.S. DOT Consumer Service and one by the FAA Air Traffic Operations Management. Both of these indices, and these are indices, they do not calculate delays, they're simply a benchmark to compare airports amongst each other in terms of their potential delay problems.

Each of them show over the course of nearly a decade that Logan Airport is a delayed airport and we have ranked consistently among the worst delayed airports in this country. Our project, our modeling, which by the way was based on a modeling that was developed by world-renowned experts at M.I.T. in the flight transportation lab there. We used the model that has been used by airports around this country and indeed around the globe.

That model has shown that Logan

Airport is experiencing today over 120,000 hours of delay, and that the cost of those delays to the regional economy is over 300 million dollars annually. We are a significantly delayed airport and it does have significant economic consequences for today and in the future.

Is this proposal part of a regional aviation strategy? Indeed, it is. It is part of a multi-airport, multi-modal transportation strategy that has been developed over a decade of planning, and indeed, has been affected by significant capital investment in the regional airports of over 600 million dollars.

The planning work, again in the commonwealth of Massachusetts, in the early 1990s when the commonwealth of Massachusetts conducted a second major airport siting study, that study was done with a blue ribbon panel of over 52 members. That study basically concluded that there was no viable feasible location to build an airport in Massachusetts given both the environmental

and social and financial consequences of trying to build such a facility.

That study was then followed on by a strategic assessment report. The strategic assessment report, by the way, also had a blue ribbon panel. That study really set the framework for a multi-airport strategy to meet growing demand for travel in Massachusetts and New England.

That study was followed on by a study that was conducted and continued to be done by six states and the state aviation directors to look at how utilizing the existing airports in New England -- how we could meet the air travel demands in the future utilizing the existing airports in New England and indeed we have.

Those studies all said that to meet the demand for air travel today and in the future that the region should invest in high-speed rail, and indeed that investment has occurred. High-speed rail is being tested right now and will become fully operational in the fall of this year.

Second, those studies concluded that we needed to build up the regional airports. We needed to invest in those regional airports to make them ready to handle increased traffic, and indeed that has happened. It has happened at Manchester Airport, it has happened at Providence, it has happened at Worcester, and New Bedford is trying to do the same.

Those studies also concluded, however, that in addition to high-speed rail and in addition to improvements at the regional airports and growth at the regional airports, that we also needed to invest and improve Logan Airport, and that is exactly what this proposal seeks to do. In fact, it is the last piece of the strategy to be advanced.

This slide shows a depiction of the regional airport system with Logan Airport as the premier airport, Manchester Airport to the north, Green Airport to the south of Boston, and Worcester to the west. These airports, these four airports, will be able

to accommodate demand for air travel in New England into the next several decades. This is the regional aviation strategy. This strategy is happening.

Green and Manchester Airports are the fastest-growing airports in the United States, and to further advance the growth of this regional aviation system, the governor has asked Massport to take a greater role at Worcester Airport and we will be doing that.

PARTICIPANT: Excuse me, Betty. Could you point out Hanscom there? I don't see Hanscom there.

MS. DESROSIERS: Yes, sure. Hanscom Airport is right about here. Now, as you can see, Hanscom Airport is intersected by the markets of three other airports. Regional alternatives were explicitly examined in the environmental document, and in the environmental document what we found is that regional airports, high-speed rail, and other activity could, in fact, have to reduce growth at Logan Airport by 7.3 million passengers, but that will not preclude the

need to do improvements on Logan's airfield.

Logan's ground access plan. Last night we heard some comments about Logan's ground access plan. Can we do roadway networks to accommodate growth at Logan Airport? Logan Airport has a comprehensive and a fully-developed ground transportation program. It is fully disclosed and evaluated in our GEIR document which we file annually with MEPA.

The proposed air side improvements will not change the ground access demand, and our ground access program has, in fact, been highly successful, particularly our Logan Express program which takes over 1 million passengers to the airport in high-occupancy vehicles.

What are we proposing to do with our project? What we are seeking to do is simply to reduce delays at Logan Airport, to improve our operational efficiency, to enhance our safety, and to do that while minimizing environmental impacts.

What we are proposing in this

document before the federal and state environmental agencies is to construct a unidirectional runway 14/32, to undertake various taxiway improvements on the field, the most notable of which is to build a new center field taxiway. The FAA is seeking to reduce the approach minimums for several of the runway ends, and we also looked at peak hour pricing.

The environmental document itself has five alternatives in it. Each of the alternatives are designed to allow for an evaluation of kind of key elements of each proposal. What we have chosen as our preferred alternative is alternative 1A.

How will runway 14/32 help the operations at Logan Airport? Logan Airport generally operates on a three-runway configuration in which the air traffic control tower can accommodate 120 arrivals and departures in an hour. Runway 14/32 will not increase that operational capacity, but what it will do is allow Logan to maintain that operational capacity when winds are

coming from the northwest.

Delay reduction. How much does it help delay reduction? It helps delay reduction at Logan Airport significantly in the near term and in the long term. As you can see here with the green bars, if you do nothing, if we are not able to build the runway, delays at Logan Airport will grow and they will grow expidentially. With the runway, the red bar, you can see that delays will decrease for nearly a decade, and even as they increase in the future, they do not increase significantly over that level which we have today.

And you can see that the comparison between doing nothing and building the runway, in fact, grow. The benefits of the runway in terms of delay reduction grow over time. This is not a band-aid approach.

Results of the noise analysis. The noise analysis shows that we are able, by building this runway, to reduce noise for those residents that live in the highest-impacted area. We are able to reduce

nighttime operations by getting aircraft on the ground quicker. We are able to shift 75,000 flights out over the harbor rather than over people's homes.

And finally, we are able to obtain a more equitable distribution of overflights for communities surrounding Logan Airport, and I want to talk a little bit about that. Today, 76 percent of our operations occur over communities that are located north and south of the airport. If we do nothing, that's going to grow to nearly 90 percent of the operations will overfly communities north and south of the airport.

If you live in Milton, if you live in Quincy or Dorchester or South Boston or East Boston, Orient Heights or Winthrop or Revere or Swampscott, you will end up in the future -- today you have 76 percent of that burden. In the future, that will grow to nearly 90 percent. If we are able to build the runway, you can see that what we are able to obtain is a much more equitable distribution of noise and overflights for

communities north, south, east, and west. And, in particular, as I mentioned, we are able to increase the number of operations over water.

What do we do to propose to mitigate the impact of the runway? First, we propose that we will build this runway and operate this runway as a unidirectional runway in perpetuity, and we will use every independent legal mechanism available to us to provide that guarantee. Those mechanisms include the state and federal regulatory agencies. We will look to include unidirectionality in our Section 61 commitments. We will seek relief from the court injunction for unidirectional operation only. We will use every mechanism available to us.

To mitigate the noise impact, we propose to soundproof nearly 1500 homes. And with respect to the environmental commission, the upland sandpiper -- excuse me. This is my very last screen. You will have all evening long.

THE MODERATOR: Excuse me one second, Betty. Please refrain from making comments. They do not add to the presentation, and detract from the amount of time that people who agree with you will have to make public comment.

MS. DESROSIERS: The last thing. With regard to the upland sandpiper, what we propose to do is to establish or create a habitat for the upland sandpiper down on the Cape which is in conjunction with the state Natural Resources Department which is desirous of that. That is the end of the presentation. I want to thank you for letting me complete it. I want to assure you that we are listening. We will continue to listen this evening. We welcome the role of the state and federal agencies to take an independent and objective view of this analysis, and we welcome their conclusions. Thank you.

THE MODERATOR: Thank you very much, ladies and gentlemen, for giving Betty your attention. Before I open the meeting

for public comment, at this time I want to explain some of the ground rules for public comment. First, let me explain what we are doing with the sign-in lists. The first people I will recognize to speak are state, local, and federal elected officials and other government officials. They will be afforded more time to speak than the rest of you by virtue of their positions, and I'm sure you can extend them that courtesy as well.

However, we already have enough people signed up. Even at three minutes per person, that will take us to about 10:30 tonight, so I would encourage you to please keep your comments distinct, and as soon as you're finished, sit down so the next person can get right up and speak.

The second group of people that I will recognize are those individuals that attended last night's meeting, signed up to speak, but then did not speak for one reason or the other. There were a number of people who left before they were called.

The third group of individuals I'll recognize are people who have not previously added comment from last night. Lastly, the fourth group of individuals I'll recognize are those people who made comment last night. Remember that your comments from last night are on the record. You need not repeat what you said last night. If you want to make a different point, however, this is your opportunity to do so. Consequently, I will be most stringent with the timing of that fourth group because if I detect they're merely repeating what they said last night, I will cut them off.

Due to the number of people that wish to speak, each speaker, aside from the government elected officials, will be limited to about three minutes. I reserve discretion in that regard. Approaching the end of the time of your opportunity to comment, I will ask you to please wrap it up, and if you continue on and don't wrap it up shortly, then I will please ask you to sit down and I would ask you then to be civil and please sit

down so that your colleagues and other people who agree with you might have an opportunity to speak. I hope I don't have to use the gavel.

Remember, this meeting is being transcribed, so each speaker should come to a microphone. I think there are three located around. There's one in the center and there's one over here on my right, your left, and there's one up front on my left, your right. Remember to identify yourself with your name and your community, and spell your last name so the recorder has an opportunity to get it right.

We will not entertain requests to donate portions of your time to somebody else. I will announce the name of the speaker who will go next and the next speaker so you can both mentally prepare and also physically get ready to step right up to the microphone when the speaker ahead of you is finished.

Let's remember what the purpose of this meeting is. The purpose of this meeting

is to give your comment to both the FAA officials and MEPA officials who will be determining the adequacy of the draft environmental impact statement/report. This is not a forum for debate. If these individuals said something tonight that was ambiguous, then I will allow a question for clarity, but I will not allow questions on the draft report itself and I will not allow debate on the draft report itself.

And as I said at the close of Betty's presentation, please refrain from vocal opposition or vocal support for what the speakers say. They do not add to the record and I will detract time from people who agree with your position for as long as the demonstration lasts. Also, those of you who are holding signs in the back, I ask that you do so so that it doesn't block anybody else's view.

With that, I will call the first speaker. I note that Congressman Michael Capalano has signed up to speak. I don't know if he's here or not, but in deference to

another speaker who has a physical disability, I will let that speaker go ahead of the congressman. So the first speaker will be Whit Saltmarsh from the Massachusetts Aeronautics Commission, followed by Congressman Michael Capalano.

T2.1

MR. SALTMARSH: Thank you very much, Mr. Moderator. For the record, my name is Sherman W. Saltmarsh, Jr., S-A-L-T-M-A-R-S-H. I am currently the chairman of the Massachusetts Aeronautics Commission. I've been chairman for the last eight years. I appreciate you allowing me to just say a few words. I know you've got a lot of people who want to speak here tonight.

I think just to give you a bit of history how we got to this point and how we at MAC feel about this, I think we owe it to the people who are really concerned about the prospect of runway 14/32. As was previously pointed out by Betty Desrosiers, the various studies that related to the second major airport study, the strategic assessment report, we also did a report for cargo in

southeastern Mass., particularly by New Bedford and Worcester. We did a passenger study for all the New England states.

As a result of all these studies, going back to the second major airport, there are a lot of people saying, then why didn't you build it? We went around the state and had a lot of hearings, we talked to a lot of people. We surveyed 182 sites. We came down to two, Fort Devens and Winchendon. Winchendon was 55 miles outside the city of Boston, and really the only good site was Fort Devens, approximately 35 miles from Boston.

Ninety-five hundred acres of land, 4500 acres of land on the north side, approximately 5,000 acres on the south side of Route 2, a good location. So that was our recommendation. If you are going to build a second major airport, that was the location. I think you people ought to know that. That was the end of it.

What happened after that? We looked into it again. The airlines didn't

want any part of it. They didn't want to spend a buck up there. What would the cost be to build a second major airport? Somewhere between 4 and 6 billion dollars. Is the commonwealth ready for it? As someone who sat in the legislature for 14 years, I don't think so.

We've got this thing going on in Boston called the Big Dig, 12 million bucks. So I don't think really from a fiscal standpoint of view you would have seen it for many years. From an environmental standpoint of view, how long would it take to get the first shovel in the ground and get it built? Somewhere between 18 and 20 years. You'd probably say, we can't believe how long it would take to do that, that length of time.

Well, Mass. Aeronautics is currently working on an extension in New Bedford from 5,000 feet to 8,000 feet. I went down with Governor Weld seven years ago to the city of New Bedford. The city council favored it, the mayor favored it, the senators, the representatives, the whole

delegation down there wants that runway extended. As you and I sit here tonight seven years later, we're still in the midst of an environmental impact report. Not one shovel of dirt has been done. So I want you just to see how long it will take to get to even build a second major airport. I think you are owed that explanation.

Now, you've got a problem at Logan. They talked about delays and whatnot. There's controversy. Some say there aren't so many, some say there are more. From the Mass. Aeronautics Commission's standpoint of view, if the delays don't ever increase any more than they are today, I think Massport has got an obligation to the people that surround this airport, all the communities that have been mentioned, to do anything they can to lessen the impact on the homes, their residences, their businesses, and their schools, et cetera, in that area. T2.1.1

Now, as Betty pointed out, they will take approximately 75,000 flights over water. To me, that's an improvement to the

people in this area. You deserve it. But if they don't do anything, you'll say to yourselves, what's going to happen? It's going to go on and on and on, and Massport owes it to you, we at MAC owe the support to make sure you'll get this small runway. T2.1.1 (cont.)

Now, what else have we done in this state? We've heard them talk about, well, what have they done to take the load off of Logan? At Mass. Aeronautics, as I mentioned, we're extending the runway in New Bedford. We work with all the directors in New England. Today as you and I are sitting here, almost 5 million people use Green Airport in Providence. Over 2 million use Manchester. We supported that, we worked with the FAA on this encouraging these projects to be built.

Manchester Airport is lengthening their major runway today from 7,000 feet to 9. They're also going to lengthen another runway at a later date. I'll guarantee you Mass. Aeronautics is going to do everything we can to make sure we lessen the load at

Logan and the best way to do it, the soonest way to do it, is to get some of these flights, some of the people, not to use Logan. If you just stop and think how many people, if we didn't have the use of Green and Manchester, the problem would be much greater today.

Now, there's one thing that hasn't been mentioned about this. I haven't heard it very much. Our main concern at Mass. Aeronautics is safety. The most important thing that we do is to make sure that the landing and taking off of planes is done on a safe basis.

Now, the people at the FAA, at this control tower at Logan, they've probably got one of the finest safety records in the country, but you know when you have delays, when you have taxiways that are jammed, when you have flights that are up in the air going around and around, the chances of something happening are a lot greater. And I don't think anybody in this room wants to see any type of an accident.

I don't think it's going to happen but there's always that possibility because when you have delays, planes circling around overhead, on the ground inadequate taxiways, then there's a much greater chance for an accident. As I say, our main responsibility is safety. There hasn't been much said about the center field taxiway. That's one of the most important parts of this project, not just 14/32 but the moving of those planes around on the ground, it's critical.

Also, I'd just like to say here in closing that we've looked at all the different things and I've talked to Steve Muench, and I just want to point out to you that eight years ago, Mass. Aeronautics only spent about a million bucks a year to improve these airports about Massachusetts and work with the region. As of today, we have spent 121 million dollars to improve these airports.

The one airport I think will give you the biggest relief is Worcester. We built that terminal up there about five years

ago. It's a shame. They used to have over 300,000 people use that airport. Now they're down below I think 70,000. I think that in due time, there's going to be enough pressure that Worcester's going to come on line. It's a beautiful facility but the problem is you can't get to the darn place. It's a shame.

I've talked to Karen Sullivan who is now the executive secretary of transportation, used to be the head of Mass. Highway. They're doing a study which is going to come up with a route to make the egress and the access into Worcester much better than today. I think when that's done, it's going to have a great impact on taking people out of Logan.

People in Worcester and that central part of the state, they'd love to have a good airport, but one they can get to. If any one of you in this room have been up in that area and you've seen how hard it is to get to, you wouldn't fly out of there, either. You'd go to Providence or Manchester. So I'm telling you that we're

going to work with Massport to do all we can to get that beautiful facility up and running.

It's got a great terminal, it's got good runways, a bright new FAA tower, and it's a shame it isn't being used. We're going to do all we can, whether it be fiscally or through the management, through the assistance of Massport and with the city of Worcester to really get that on line, and I think it will happen. It won't happen overnight but whatever goes on in Worcester is going to be taking more out of Logan.

So just in closing, I want to thank you very much. I had a hip replacement and I can't stand very long, but as someone who has served in the legislature for 14 years, I say to you, I understand why you are concerned. It's in your backyard. But believe me, for a long period of time, nothing was done at Logan, nothing was done at any of the airports in Massachusetts.

They went to hell in a hand basket, and I really believe that this current board

of directors is out to try to really improve the facility and get some of these planes off your back, and I think that you can see you're going to get 75,000 flights moved over different directions over the water, and I would suggest that you support it. Thank you very much.

THE MODERATOR: Thank you, Mr. Saltmarsh. Is Congressman Capalano here? We'll move on to the next speaker and let him speak as soon as he gets here. Next we'll hear from the mayor of Revere, Bob Haas.

MR. HAAS: I am Mayor Bob Haas from the city of Revere. I'd like to thank you for inviting us this evening, and more importantly to have the people here and at least let them voice their concerns and opinion.

The proposal to lower the weather minimums for landing on runway 22F, Revere simply objects this proposal to lower decisional heights for landing on runway 22F in poor visibility weather. We see no advantage to the airport, and possible danger

T2.2.1

to the community as a result of this proposal.

With lowering the decision height, the control tower will allow more planes to approach over Beachmont Hill during weather with poor visibility because planes would be allowed to fly closer to the airport before the pilot has to see the hill under worst conditions. T2.2.1 (cont.)

In poor visibility weather, the pilot does not have to see Beachmont Hill in his approach. Given the already narrow envelope between the existing approach down and the top of Beachmont Hill, an early decision height would increase the potential of a hazard for the Beachmont residents.

In speaking on proposal 14/32, Revere is extremely concerned with the implications an additional runway would have on additional air traffic. We are not totally convinced that the construction of runway 14/32 will result in less air traffic over the city of Revere. The city needs to be assured that the existing number of T2.2.2

flights currently utilizing runway 32L will increase as a result of the construction of runway 14/32.

It is Revere's opinion that the new runway will increase airport capacity which will obviously result in increased air traffic congestion and additional air traffic over our community. Until the community is guaranteed that air traffic over Revere will decrease from the current condition as a result of this new runway, the community will stand opposed to the construction of runway 14/32. T2.2.2 (cont.)

My comments were sent on March 26th, 1997 when the issue came out from Massport that they were thinking about increasing and bringing back to the table 14/32. I will be submitting additional comments before the final deadline which will be April 22nd, and I hope all the people who back me will also voice their concerns one way or the other. T2.2.3

If we are talking about increasing airport traffic, passengers, over the next

ten years by almost 20 million passengers, people coming from the north have to go through my city in order to get to the airport. If I'm looking at the traffic congestion that is there presently, you're addressing ten years down the road when, as Massport indicated, we'll have almost 20 million more passengers coming into our area.

T2.2.3 (cont.)

When I talk about our area, I'm speaking about Revere tonight, but again, what happens in Revere happens in Winthrop, Boston, Quincy, East Boston, Chelsea, et cetera. This is an area that I believe if we don't address the traffic problems which were addressed in 1997 in our communications, we in Revere will be in complete gridlock.

I just came from the city of Revere coming from Mahoney Bell Circle and I'm coming south. There's all kinds of traffic there. What was it, 6:30? As you can imagine with all this additional traffic going into the airport, I think we have to really research that, I think we have to put a hold on our plans at this point in time. I

think that if you're looking at the airport, maybe the airport's expanded much too much at this point in time. So I really honestly think you people should really listen to what the people here say tonight.

I look at one other issue that I find quite disturbing. We have a land side committee, an air side committee, and it seems like you divided -- some people think by dividing their forces, it's easier to conquer. I honestly believe that people here, the elected officials in the affected areas, this is one issue and it showed last week in Boston when I arrived at 5:30 at the state house, we looked out, we saw signs not only from Revere, not only from Chelsea, Winthrop, Boston, and we saw them out in the outskirts also.

So what I'm saying, in summary, is that I believe the traffic congestion, without question, is a major, major problem. I have to look at the decrease in the visibility coming over the Beachmont area which also affects the Point of Pines area

because, in case you have to abort, you have the airport, and I think it's much more dangerous because there's more planes that are stacked up that come in.

So with that for the city of Revere, we thank you for listening to our comments, and we will be here if anyone has any questions later on. Thank you.

THE MODERATOR: Thank you. Next we'll hear from Preston Galano from Chelsea. Following Mr. Galano we'll hear from Paul Nowicki, Chelsea City Council.

MR. GALANO: Thank you very much. T2.3
The majority and the focus of my presentation today will address the inconsistencies and inadequacies of the proposal before us as they relate to the city of Chelsea. I will, before the April 23rd deadline, submit a more comprehensive written comment.

First I'd like to address the issue of the noise impact assessment. In order to go forward, it's necessary to look backward. I first started examining the noise contour shortly after I bought my home in the

historic waterfront district in 1996. After becoming elected to represent District 8, one of the communities that will be most heavily impacted if this proposal is authorized, I had the opportunity to attend a public hearing with the FAA and the Massport noise abatement and aviation planning officials.

It was at this meeting in 1998 and through several communications between myself, Senator Kerry's office, and the FAA that I learned why Chelsea is considered just outside the 65 D and L noise contour. It's because Massport submitted a map to the FAA based on a prediction made by a computer model that has consistently underestimated the noise level in our community.

The proof is in the GEIR and I will submit copies of my communications with the FAA along with this statement. The fact is that actual, that is, measured noise results in Chelsea have been year after year above 65, and the predicted number used by Massport to assess the noise impact on my community is below 65. How convenient.

T2.3.1

Without an accurate noise assessment, the true impact of health, environmental, and real estate value effects cannot be clearly defined, making any mitigation offer unreasonable. Based on the fact that Massport is using the same process to measure noise impacts that they have in black and white and in public admitted is not accurate, and based on the fact that the FAA recognizes the predicted noise levels are less than actual noise levels, the draft EIR should be rejected. T2.3.1 (cont.)

Further, it should be noted that the noise monitor location, that's Figure 5.2-1 on Page 5-13, indicates that there is a permanent noise monitor on Admiral's Hill in Chelsea, while all subsequent analysis of measured noise data is placed at Shirtleff and Essex Street in Chelsea. That's a site that has not had a permanent monitor since 1991, and then for only one year. T2.3.2

Another area of the EIR that's inadequate with respect to accuracy and thoroughness is the four-page evaluation in

Section 8.7 of the environmental justice issue. Chelsea will receive the brunt of the short-term negative impacts of this proposal should you see fit to give your approval.

In a presentation to the Chelsea City Council on March 3rd, 1999, Massport representatives said runway 33 departures will increase from 4.8 percent to 12 percent of total departures. That's a 150 percent increase. And runway 15 arrivals will increase from 1.5 percent to 7.7 percent. That's a 413 percent increase. T2.3.3

The associated increase in noise is large enough that even using the understated predicted noise measures, 1100 homes will be eligible for soundproofing. While we feel sound insulation cannot fully mitigate the impacts of increased ambient noise levels, many of the older homes will not be eligible for funding due to FAA order 5100.38A which requires the property owner to bring homes up to code before they pay. T2.3.4

We realize that Chelsea is the only community impacted devastatingly enough to

qualify. The EIR concludes, and this is in quotes, Given the reduction in the highest noise-exposed population and this mitigation, soundproofing, the low-income and minority populations will not experience disproportionally high adverse impacts in comparison to the affected population as a whole.

T2.3.5

This analysis is neither thorough nor accurate as the EPA census maps on population density, minority concentration, and people below poverty level in Chelsea show. The EIR's conclusion conflicts with President Clinton's environmental justice executive order 1289A which was designed to prevent the types of environmental and health injustices that have occurred in Chelsea for over a hundred years.

To demonstrate this, I've also attached a copy of an EPA-funded report on the extent of industrial pollution in Chelsea and its relation to the socioeconomic status of Chelsea residents. This is no coincidence. Essentially, the four-page

environmental justice analysis contained within the EIR does not adequately analyze the environmental effects including human health, economic, and social effects of the proposed expansion, and I would suggest the analysis is yet another clever obfuscation of the truth, and the analysis in the EIR does not meet the standards of the Department of Transportation order. T2.3.5 (cont.)

I really consider the two previous points my strengths, but I'd like to briefly add that the EIR is either inaccurate or incomplete with respect to the following. One, alternatives under discussion such as comprehensive peak hour pricing analysis using a range of operations per hour levels instead of the single higher operational threshold that underestimates the delay reduction. Hanscom should not be ruled out as a piece of the regionalization solution, and a second major airport should have at least been considered. T2.3.6 T2.3.7

Two, air quality measurement. Noise and air quality equipment should be

along flight paths. Chelsea's air monitors at the Soldier's Home, out of harm's way. T2.3.8

Three, the impact on the upland sandpiper, a plan to relocate or mitigate for this endangered species is inadequate and also indefinite. T2.3.9

Also, the traffic study. A study of the long-term traffic impacts on the surrounding communities should be as comprehensive as possible. T2.3.10

Also, a benefit cost analysis, how can you realistically and honestly mitigate the noise, health, and real estate cost to our residents? Also, the commitment to maintain the new runway's unidirectional status, there isn't one. Data used for this analysis is over five years old and does not reflect current conditions. T2.3.11

For all of these reasons and I'm sure many more, I encourage you to find the proposal before us today functionally inadequate, and I would respectfully request that a new draft document should be required before any expansion can be considered. I would also suggest that any future requests

for expansion include an independent impact assessment that would meaningfully, thoroughly, and accurately detail the impacts on surrounding communities like Chelsea. Thank you.

THE MODERATOR: Councilor Nowicki, I'm sure you will agree with me that we will hold you off and let Congressman Capalano now speak.

MR. CAPALANO: Having just flown in and arriving on 15/33 45 minutes late, I'm still against 14/32. I'm against 14/32 because my 45 minutes is not as important as the peace and quiet and the enjoyment of their homes of the 600,000 people that live under the flight paths. I will speak about many of the things you'll hear tonight. I believe that you will take into consideration the environmental justice of overloading one area of the state or one area of any region that benefits the entire region, yet the burdens are not fairly and equally shared. T2.4

That's why I oppose this runway, because I don't think enough thought, enough

consideration, and enough heart has gone into the decision to do this that hurts too many people too directly, yet benefits the entire region. That's what environmental justice is supposed to be all about. Everybody gets to benefit, and everyone shares the burdens as equally as possible. That doesn't happen if this runway is built. That doesn't happen.

Tonight you'll hear an awful lot of details, more details than I can give you, more statistics than I give you, because you've got a lot of people in this room that know this issue better than I do. But I don't think it takes 5,000 pages, I don't think it takes a Ph.D., I don't think it takes a brain surgeon to understand that building this runway before adequate and fair consideration and every single effort is taken to reduce the impact, the negative environmental impact, on the most densely-populated area in New England, one of the poorest areas in New England no matter how you measure it, one of the most racially-diverse areas no matter how you measure it in

T2.4.1

this country.

I came tonight to ask you to make sure that you stop this runway at this time because it's not fair and it's not right. Thank you for taking me out of order.

THE MODERATOR: Now we'll hear from City Councilor Paul Nowicki from Chelsea. He'll be followed by Jerome Falbo from Winthrop.

MR. NOWICKI: Good evening. My name is Paul Nowicki. I've been a city councilor in the city of Chelsea since 1991. I'm standing here on behalf of the people of Chelsea because for far too long, we've been taken advantage of and we are very angry, we are very upset, we are very worried. It started with the bridge in the '40s and the '50s and it went to, as Mr. Devellis will note, to MWRA that was stuffed down our throat and 42 other communities, and now this runway.

T2.5

T2.5.1

All of these things benefit the entire state and region, but instead we're the ones that take the full burden and it's

not fair, it's not proper, it's not right. We look at, and I'm speaking solely on behalf of the people in Chelsea, there have been no communities that's had to battle back from more problems than the city of Chelsea since the early 1900s, whether it be corruption, fiscal chaos, two conflagrations that destroyed blocks, 10, 20, 30 blocks of our community. No city has had to come back.

But you know what we've done since 1991? We've put professional government in place, we've balanced five consecutive budgets, we have a surplus of over 4 1/2 million dollars, we have state of the art new schools, our population is increasing. What we have is improvement to the city of Chelsea.

What issues we do face is quality of life issues, that is, of noise, of traffic, and of pollution, as that's everything this airport, this runway stands for. That's what we're worried about. We stand up here today talking about improving everything. Well, what has improved in the

city of Chelsea is the fact that our property values have gone up over 20 percent over the last few years, 20 percent. And if you look at a 1985 FAA study, it says for every decibel level increase, there is a 2 1/2 percent decrease in property values.

That is something that the city of Chelsea cannot afford, or we will go back to receivership and we're going to go back to being a part of either Revere, Everett, Boston, some other city, and as a city councilor, that frightens me because the people of Chelsea are indeed the true foundation, the poor, the middle class, the working class of our community, of our society. That's what we are in Chelsea.

We're not the multi-million dollar business owners. They live out in Newton and Wellesley and out west. They take millions of dollars off us and then go home. We're the people that make minimum wage. We're the people that have to sit in our backyards with our children to have a barbecue and a family outing and have planes going over our heads.

We're the people who walk our dogs on the front lawn and down Central Ave. and Eastern Ave. in front of our 40 million dollar school and have trucks heading to the airport, have the vans with passengers heading to the airport on my streets.

We're the city that has put in 20 million dollars of capital improvement, taxpayers' money, to improve our sewer system, but more importantly our streets and sidewalks which continuously gets destroyed by the overburden of traffic which a lot of it comes off that bridge through Revere, as Mayor Haas has said, right down Eastern Ave. hitting Webster Ave. off of Route 16, Central Ave. coming through our square, William Street when they cut through Charlestown. All of the cities are impacted by this.

The people of Chelsea cannot afford to take this hit again. We've replaced over 100-and-something homes which took away millions of dollars of taxes when they put that bridge through our city. And then when MWRA got stuffed down our throat, we were

paying more on water and sewer bills than our taxes.

And now we have fought so hard, come back from so many situations to have a city that is viable, that is alive, that is putting millions of dollars back into its streets and sidewalks. It's quality of life. Crime rates going down, trees going up, people coming to our schools. That's what's important. That's America. That's what Chelsea is all about, and the 28,000 people of Chelsea are with me and we are against 14/32. Thank you very much.

THE MODERATOR: Now we'll hear from Jerome Falbo from Winthrop, and following him will be Jerry Ogus, selectman from Winthrop.

MR. FALBO: Gentlemen, I am Jerry Falbo, chairman of the Winthrop Airport Hazards Committee. I want to thank you for having us here tonight and listening to our statements. I'm not going to be repetitive. There are many people that want to speak. We have a lot of younger people who have good ideas and have plenty to say. I want to make

T2.6

one comment and then I want to read a letter which was a pleasant surprise we received yesterday, and I think the rest of the audience should enjoy the contents of this letter.

I kind of resented the condescending point of view expressed a few moments ago and some facts by the head of the Massachusetts Aeronautics Commission. Let's face it, gentlemen, you remember what the true facts were back in 1990 when the study was done for the second airport by I can't remember his name. He's now a professor at Trinity College. But when he came out, he said the second airport should be at Fort Ayer. That was buried by Governor Weld. It never got off the table. You know that.

THE MODERATOR: Mr. Falbo, if you would make your comment.

MR. FALBO: That was a fact. I didn't mean that as a personal attack. I'd also like to say what the gentleman neglected to mention is within the next year, Governor Weld appointed a commission to study the

T2.6.1

regionalization of airports. They came back within six months to a year with a beautifully bounded edition recommending that's how we should go in the future. That was years ago, and Massport nor the commonwealth has taken any action on it.

T2.6.1 (cont.)

Let me get to the real point. We were pleasantly surprised yesterday by receiving a letter from Representative Edward J. Markie from the 7th District of Massachusetts, and the letter was directed to John P. Devellis, regional administrator, the United States Environmental Protection Agency, with a copy to Jane F. Garvey, administrator. I think the contents of this letter has such depth perception over it that it almost summarizes everything that everybody will say here this evening.

Dear Mr. Devellis: I am writing to express my opposition to the proposed expansion of --

THE MODERATOR: I don't mean to interrupt you, but if you're going to read the letter, we can put it in the record

rather than having you read it. Please highlight it in a couple of minutes and then you can put the letter in the record. T2.6.2

MR. FALBO: Let me say here, The construction of the new runway would expand Logan's capacity for operations and increasing current potential for future growth, but there are several reasons why the Environmental Protection Agency should advise the FAA against the implementation of runway 14/32.

These include the resulting increase in noise pollution and other adverse environmental impacts runway 14/32's ineffectiveness in alleviating delays and the lack of comprehensive progressive regional plans to utilize New England's regional airports.

I'm going to skip a couple of paragraphs in deference to your position, sir.

THE MODERATOR: Thank you.

MR. FALBO: And I'll get to, Massport projects that in a 37-5 million high

fleet passenger scenario, there will be approximately 250,000 annual hours of delay with the implementation of alternative 1A. On the other hand, if alternative 2 was implemented which omits the construction of 14/32 but includes peak period pricing, delays would amount to approximately 205,000. That's a reduction of 45,000.

Then he talked about low fleet conditions and high fleet scenarios. In the high fleet scenarios in which more planes are used and over-scheduling becomes a factor in place during peak times, runway 14/32 becomes more of a hindrance than an assistance.

T2.6.3

I am firmly convinced that we must examine closely the status of our regional aviation transportation system before we implement any new structure changes at Logan International Airport. It is projected that Route 128 and I-495 corridors will experience the commonwealth's greatest population increase as we approach the new millennium.

It is the responsibility of both the federal and the state governments to

devise a strategy that insures some of the burden at Logan is relieved by those regional commercial airports that would welcome increase in regular scheduled passenger service. I agree with Boston Mayor Tom Menino that a blue ribbon panel should be established to drive such a regional aviation transportation strategy. T2.6.3 (cont.) T2.6.4

We must consider the adverse environmental impacts on these communities surrounding this airport. The primary goal for its construction is to alleviate delays caused when Logan is burdened by heavy northwest winds. However, without a plan for the optimal use of our regional airports to alleviate these pressures from Logan, I cannot support the implementation of a new runway or any additional expansion at Logan Airport. My final word is this, and that is the EIS/EIR. It is irreconcilably inadequate and the secretaries should so find.

THE MODERATOR: I do appreciate you cutting your remarks short. Next we hear from Jerry Ogus, a selectman from Winthrop,

followed by John Nucci.

MR. OGUS: Good evening. I'm chairman of the Board of Selectmen from Winthrop and I know yesterday you heard from one of my counterparts. T2.7

THE MODERATOR: Just to make sure I've got your name right, could you say it again for the record?

MR. OGUS: Ogus, O-G-U-S, first name is Jerry.

THE MODERATOR: Thank you.

MR. OGUS: I'd like to see the focus shifted a bit here. We hear about things such as delays. What I think we really should be talking about here is we should be talking about people. I think we should be talking about people's health. I think we should be talking about the environment. I think that's what we should really be talking about, not delays.

Now, it defies, I think, our intelligence not to think that if you increase flights by a minimum of 70,000 flights a year and you talk about larger and

bigger planes, more people, that we're going to lessen the impact on the environment.

We know, just as East Boston knows, because the airport sits on Winthrop land and on East Boston land, we know what goes on out there every single day. We see the pollution. We know about the problems to the wetlands. We know about the problems to the clam flats. We know how it affects Bell Island marsh.

We see on our cars, in our homes, and what we breathe every single day, we see what impact the airport has on us, and there's no way that you can tell us that an increase in flights of larger planes is going to help the environment. I think that's where the focus should be.

How can we consider doing something like this without really having scientific evidence? How can we take a chance with people, with people's health, welfare, their very lives, their children's lives? How can we go forward on something like this without doing the necessary health studies?

T2.7.1

I was at a rally last week over at the state house and Senator Lynch from South Boston reported the results of a study there. He talked about the commonwealth of Massachusetts, and that South Boston had something like a 61 percent increase over the state average for breathing and respiratory-type ailments. Doesn't that say something? I think it says an awful lot.

T2.7.1 (cont.)

And before this is even considered any farther, I think what we really need to do is we need to go back and we have to do some really detailed analysis, and care about people and the health of people before we start talking about building more runways and having more people coming into the area.

In closing, I'd just like to say we have a detailed report from the town of Winthrop. We may have our unique situation where we're located, but I do know this from being around all of the surrounding communities and being as involved as we are in this process, that what we say is the same thing that they say in South Boston, the same

thing that they say in Chelsea and Revere and Dorchester and Mattapan and Roxbury, it's everywhere. People don't want this airport and tney don't want it because they have good old-fashioned common sense. Thank you.

THE MODERATOR: Now we'll hear from John Nucci.

MR. NUCCI: Thank you very much, and thank you for taking the time to come out to this community and hear comments right here in the impacted area. We do all appreciate that very, very much. T2.8

It's actually a pleasure to be before a group that has in its name environmental protection because if your mandate is to review environmental protection, I can't imagine it's going to take more than 30 seconds to determine that planes and runways don't protect the environment.

The people in this room have dealt for many, many years with Massport, with airports, with runways, with planes. My father stood before Massport and groups like

you fighting against airport expansion and here I am 25, 30 years later.

With all due respect to the people who are at Massport now, and they're good people, they're doing their job, if we allow them to build this runway, we remove all the incentive to look at the other alternatives. I guarantee you the game will stop, the process will stop. The other alternatives, the second airport, Hanscom, Worcester, and anything else will be off the table for a long, long time. We can't afford that. T2.8.1

Now, I've heard, and I've remained relatively silent as I've heard the criticisms of places and people like East Boston, Chelsea, Revere, Winthrop, and I've heard people, proponents of this runway, say that they are NIMBYS, that they're not in my backyard people, that they don't want it in their backyard.

Well, let me tell you something about my backyard. I'm a lifelong resident of East Boston and my backyard is this neighborhood, and in my backyard is this

hotel, other hotels, a racetrack, a couple of tunnels, an awful lot of traffic, three tunnels, an awful lot of traffic. We are not people who say not in my backyard. We are used to living with unpleasant things in our backyard.

But as I've heard said before, at some point, and the mayor said this quite well, at some point we have to say enough, and what you're hearing now is a group of people who are not trying to keep their community free of all urban pressure, of all urban negative effects. We understand. We live in an urban area. When I bought my house in East Boston after having grown up in my mother and father's house, I knew it was near an airport. I was aware of that. I knew there'd be airplane noise, but I'm not going to stand here and let you bring more airplane noise in.

I saw the news accounts of your hearing last night, and again, I do appreciate you having a second hearing in the neighborhood, and I'm reserving some comments

for them that I've also kept to myself. Last night you heard an awful lot of support for this runway from the Boston business community, the so-called pillars and leaders of our community.

You ought to understand that we all have motives for opposing this or supporting this. I've told you my motive is to improve the quality of life, to keep the quality of life for my family in East Boston. Those are my motives. The Boston business community folks should be ashamed of themselves. The Boston Chamber of Commerce, the Tourist Bureau, it appears as though their only important factor is getting customers into their business to spend money in their business.

They should not only be representing their business interests, as a chamber of commerce, as business leaders, they should be concerned with the quality of life in the city in which they work and do business, and they are not. To me, it is unconscionable that people don't live in this

impact area, come in here and root for a runway, drive back to their suburban homes, pour themselves a martini, and wait for it to happen.

I would ask you in closing to please fulfil your mandate, the very mandate that's in the title of your agency, environmental protection. Runways and planes don't protect the environment. Thank you.

THE MODERATOR: We have one more government official that wishes to speak, Juan Vega, president of the Chelsea City Council.

MR. VEGA: Thank you. I didn't come prepared to speak but I did want to take the opportunity and join my colleagues on the Chelsea City Council in also voicing opposition to this runway. I'm a lifelong resident of the city of Chelsea, and you mentioned, I'm currently serving as the president of the city council, and I just wanted to reiterate to you that the entire Chelsea City Council has voted and have taken steps to further the cause in terms of

T2.9

opposition to this proposal.

It does not represent anything good for our community. The information that was cited very eloquently by my colleague, Preston Galano, as well as Paul Nowicki, in terms of the impact and in terms of the things that we ask you to look into is essentially what I just wanted to reiterate.

I wanted to add the characteristics of this city council especially in light of the previous speakers mentioned that the business community is supporting this and so is their insinuation of the business community is that the rest of us aren't for business or the rest of us don't care.

In Chelsea's history, I don't think there has ever been a more pro-business city council or pro-business government which has been most responsible for Chelsea's turnaround. We have given unprecedented incentives to businesses to keep them in the community. We have taken unprecedented steps in terms of improving our schools, public buildings, improving our streets.

We have adopted a capital improvement plan which basically goes against some of our work with our constituents. The capital improvement plan says we're planning for five and ten years ahead of time so you don't get to fix your street in your neighborhood until it's time, until we've decided it's time in the plan. Those are the kind of steps that we have taken as a community.

And we very, very strongly support anything that enhances the community and enhances the business of the community because, in turn, that does improve the quality of life. This does not improve the quality of our lives nor of anybody in this room.

In terms of the impact, the massive negative impact that this will have on the quality of our lives, it is something that we ask and appeal to your sense of justice in terms of understanding, as was mentioned also by the previous speaker, all of the other things in your backyard, all of the other

things that we have to live with on a day-to-day basis, salt piles and trucks and oil tanks and asphalt plants, et cetera, et cetera, et cetera.

So I ask you all to take this proposal in that context. It's not just about a runway. For all of us, it's about all of those things combined and we ask you to look at that in that broad context in terms of what it's going to do to all the people in the surrounding communities.

Also, as was mentioned by my colleague, to measure the environmental injustice that this proposal represents, and the disproportionate impact that it will have in the surrounding communities given the economic, the socioeconomic of this community. T2.9.1

Let me also mention that for every single person that's here in opposition, make no mistake, there are 50 and a hundred and 150 neighbors that are also in opposition, and that is precisely what the president is looking to combat. This notion that

everybody, if they were really opposed, they would all be here, well, let me tell you something, there are people in my community and in surrounding communities that are afraid to come to a meeting like this, and there are people that can't come to a meeting like this because of other commitments.

Everybody that's here has taken time out of their personal life, a sacrificing they're making to come and speak to you this evening, but there are hundreds and hundreds of people whc just aren't going to come for a number of reasons, and that is precisely what the environmental justice strategy is that communities like ours have a lot of circumstances where we're not going to all come, not all 600,000 people are going to come in front of you, but don't wait for that. This is enough. These are the people that are telling you that they are here for their neighbors, they're here for their friends, their families, their children.

And it's really important again in terms of just understanding that the

communities we're dealing with are not going to be coming up here in great numbers, and these are the folks that are representing them. Thank you very much, and again, I appeal to your sense of justice to put a stop to this proposal and let them look for the alternatives and then take this up whenever, but no on runway 14/32. Thank you.

THE MODERATOR: We've exhausted the list of government officials who wish to speak. At this time I'm going to take a brief recess before we open the floor to individual comments. It's now 7:59. We'll reconvene at 8:05.

(Brief recess taken.)

THE MODERATOR: There are plenty of seats in the front row if you'd like to sit down. Once again, I remind people with signs if they would please hold them in a way that did not obstruct the view of anybody behind you. One more government official has signed up to speak. It's Rochelle Bennett. We'll hear from her, but before we hear from her, let me tell you what's going to happen

afterwards.

We will alternate between supporter and opponent, and in fairness, since all but one of the government officials spoke opposed to it, we'll start with a supporter. Also, there are far fewer supporters than there are opponents, as you might imagine. Each person will be strictly limited to the three minutes. We have enough people now that even at three minutes we will go way into the night, so I will hold people to a three-minute maximum.

At two-and-a-half minutes I will tell you to wrap it up. At three minutes, I will tell you to please take your seat and the next person should start right away. Any applause will take away the time from the next person. So first we'll hear from Rochelle Bennett.

MS. BENNETT: Thank you. My name is Rochelle Bennett and I'm a city of Chelsea councilor. I was not going to speak this evening but I have to speak. Chelsea, as you know from the list of previous speakers from

T2.10

the council, is a community that has gone through a lot as have all of the communities here, and the reason I got up to speak is the health impact isn't being addressed as much as it should be. T2.10.1

Chelsea not only has the Tobin Bridge, it not only has Logan Airport, we have salt piles, we have truck traffic that number in the thousands per day through the city of Chelsea to get back and forth to the airport. The salt piles that Massport has in Charlestown also affect Charleston, Chelsea, and East Boston. The salt piles that Chelsea has affects Charlestown, East Boston, and Chelsea.

I happen to live under runway 15/33, and it has impacted my health. I am one of the victims of what can happen when you live in a community that is so heavily impacted environmentally as Chelsea is. When I became the District A councilor, I couldn't believe the area that I got with all of their environmental problems we had there. I have lived there for 13 years and I am one of the

victims of living there.

THE MODERATOR: Now we'll hear from Jim Kloche, Greater Boston Chamber of Commerce. Following Mr. Kloche, Kathy Callahan.

MR. KLOCHE: Thank you very much and thank you for holding this hearing. I'm Jim Kloche. I'm the director of economic development for the Greater Boston Chamber of Commerce. The Greater Boston Chamber did a study a year ago in which -- I live in the city of Boston -- in which we identified the five industries that contribute the jobs to our economy, health care, high tech., higher ed., financial services, and tourism. All of these industries depend on Logan Airport. All of these industries bring customers and workers in and out of Boston every day. T2.11

We believe that we need a two-step approach to address the air travel issue. Step one is to do more with regional airports. Step two is an expanded 14/32. The chamber believes that if we can take these two steps, we will set the stage for T2.11.1

job creation to 2030 in the greater Boston area.

If, on the other hand, we do not, we risk threatening the competitive position of those five industries, high tech., higher ed., health care, tourism, and financial services. Those industries represent half the jobs in our area, and they support another 30 percent of jobs. Again, we ask for your consideration of this proposal. We appreciate your holding the hearing tonight, and we wish to be recorded in support of both regional airports and 14/32.

THE MODERATOR: Next will be Kathy Callahan. Following Ms. Callahan, we'll have Glen Morse from Continental Airlines.

MS. CALLAHAN: Hi. My name is Kathy, with a K, K-A-T-H-Y, Callahan, C-A-L-L-A-H-A-N, Bunker Hill Street, Charlestown. T2.12

THE MODERATOR: Hang on a second. We'll lower the microphone for you.

MS. CALLAHAN: I say that where I live because there's another Kathy Callahan in Charlestown and I've gotten her into all

kinds of trouble. Congressman Capalano said that you don't have to be licensed to understand this issue, but Preston encouraged me to speak about a couple of things because I am licensed, and in a little bit I'd like to speak about overwhelm, overload, overkill, and homework problems in a couple of minutes.

This is an editorial that appeared in the Herald, a piece of it, and it's hard to read my handwriting so I'm going to read it. I have lived on two battlefields. Before moving to Bunker Hill Street in Charlestown, I lived in Lexington. Bottom line, based on living in Lexington and going to meetings, it's a class issue.

Charlestown is sacred turf. So is Lexington. I happen to want to stay in Charlestown and I really would like to buy a home there this year, but if Massport builds the runway for the conventioneers, I'm moving out. Quality of life issues are important to me. I'm a writer about attention deficit disorder. Even if you don't believe in attention deficit disorder, you all know

people here who are easily affected by noise. Everybody does.

By way of example, I'm originally from the New York area. New York City is a study in contrast. That's also a world-class city. Research shows that the New York City economy and tourist trade isn't suffering because planes fly into and out of Newark, JFK, and Laguardia. All of the runways that service New York City are located 15 to 20 miles outside the city.

Individuals and companies, as far as I can tell, aren't pulling up stakes and moving out because they have to drive into New York City. New York City had the foresight not to build an airport smack dab in the middle of the city where residents sleep, read, and recreate and have barbecues.

Massport and the governor have a lot to learn from New York City and the people in this community who have to help their kids with homework every night. How hard is it to get a kid to settle down and read? Add all these planes over their heads,

it's going to be a nightmare.

Across the board, those who support the runway mostly don't live in the area. I would love to stay in Charlestown, I love my neighbors, and I put together a petition that I will circulate eventually with the help of CARE because I'm a member of that group. T2.12.1

THE MODERATOR: Please wrap it up.

MS. CALLAHAN: It's in support of Representative O'Flaherty and Delio's legislative bill 1576 which opposes the runway. Thank you.

THE MODERATOR: Next we'll hear from Mr. Glen Morse from Continental Airlines, and following him will be John Tardif from Winthrop.

MR. MORSE: Thank you. Good evening. My name is Glen Morse. That's M-O-R-S-E. I'm senior director, industry affairs, for Continental Airlines. Prior to joining Continental Airlines 14 months ago, I was serving as managing director, regional operations, for the Air Transport Association. ATA is a trade association for T2.13

all the major U.S. passenger and cargo airlines.

In my role with ATA, I worked closely with FAA and Massport to implement environmentally acceptable air traffic and airport improvements to reduce the historically high level of delays at Logan. As a result of this involvement, Massport asked me to co-chair the air side review committee which was formed to insure active and extensive community involvement in the planning and environmental processes associated with the Logan air side improvements planning project.

The air side review committee was comprised of community and business representatives, and served as a technical liaison between Massport and the many diverse constituencies around Logan. In order to further assist the community in the review process, Massport allocated funds to the Logan Community Advisory Committee for an independent consultant to analyze and critique the technical results of this study.

It is important to note that the CAC's consultant did not dispute, and in fact accepted, Massport's technical findings on the operational benefits of the environmental analysis which serves as the basis for this environmental documentation. The purpose of this introduction is to describe briefly the extensive coordination process which Massport used to foster understanding of the various components of the proposed Logan air side improvement project.

Continental Airlines supports the implementation of all of the airfield improvements and the instrument approach minimums reductions contained in Massport's preferred improvement alternative 1A. To repeat, alternative 1A consists of the mid-field taxiway, the minimums reduction for runways 15 right, 22 left, 27 and 33 left, extension of taxiway D, as in Delta, realignment of taxiway N, the southwest taxiway optimization, and the unidirectional runway 14/32.

For the record, we concur with

Massport's decision to exclude implementation of peak hour pricing from the preferred alternative at this time because its limited delay reduction benefits as identified in the draft EIR/EIS, its adverse economic impacts, and a firm belief that it does not address the primary causes of delay at Logan; that is, wind and weather.

We support all of the taxiway improvements, most notably, the mid-field taxiway, because they will enhance the safety and efficiency of aircraft movements on the airport. These efficiency gains translate to environmental benefits as stated in the draft EIR/EIS -- T2.13.1

THE MODERATOR: Please wrap it up.

MR. MORSE: -- because they reduce taxi times and consequently reduce engine and noise emissions. Finally, Continental supports the construction of unidirectional 14/32. Everyone acknowledges that 14/32 is not a silver bullet for all delays. However, in good weather when the winds are from the northwest like tonight and delays are caused T2.13.2

because there's only a single arrival runway, this program will serve to eliminate those delays.

THE MODERATOR: Thank you very much, sir.

MR. MORSE: This is a problem that we have now and will continue to be a problem in the future.

THE MODERATOR: Now we'll hear from John Tardif, followed by Gail Visentin.

T2.14

MR. TARDIF: Mr. Moderator, I'll try to speak quickly in my brief time period. My name is John Tardif, T-A-R-D-I-F. Massport, in their opening statement, made reference to an injunction. You may be aware that 1974 through 1976 that court order went into effect. It indicates Massport shall not be allowed to further construct runways at Logan Airport.

That, sir, was signed on with agreement by Massport and the secretary of environmental affairs from this commonwealth. Those parties agreed at that time that there was irreparable harm, irretrievable,

irreconcilable, permanent, irreparable harm. No runway was built. The economy blossomed.

It's about the environment. It is about people, it's about churches, it's about neighbors, it's about quality of life, but it's also about a reasonable, fair, accurate evaluation of the Massport report. The whole thing surrounds the parable of 120. You're all aware of what 120 is for aviation people. To these people, it means a plane every 30 seconds.

When that injunction went into place, there was only 200,000 planes, I knew that in 1974 and 1976, that flew in and out of that airport. Now today there's 539,713 planes this year. With a marginal 4 percent increase, there will be 600,000 planes next year. That is a three-fold increase. Has the environment corrected itself? Has there been a self adhesive on this band-aid?

The problem with the EIR is Massport is myopic. They see 14/32 as the exclusive center of their report in that EIR. Oh, well, those runways are already there.

We're not taking into account the effect of that whole body. That's why the science is skewed. It is junk science. I ask you to disregard it.

Very briefly on that rise in airport traffic. We can reasonably expect that with the runway construction they will be able to increase, even with their 75,000 number offset by the use of the new configuration, to reach 120.

THE MODERATOR: Please wrap it up.

MR. TARDIF: One twenty will be 863,000 planes over this town, over this community, over the million people that stretch from north and south. We can't take 120. It doesn't fit in an inner-city airport. As to the other arguments of delay, that's been refuted by a 3 percent accuracy taking out cancellations which should not be in there. And lastly I say, if tourism is an endangered species, then we will not be sacrificial lambs to indentured servants of tourists.

THE MODERATOR: Ten seconds will be

subtracted from the next opponent's speech. Gail Visentin is next.

T2.15

MS. VISENTIN: My name is Gail Visentin and I'm British Airways director of passenger and cargo operations at Logan. I was born in Chelsea and I lived the first 15 years of my life in Revere. British Airways has been serving Logan since 1952, and is

T2.15.1

sensitive to concerns about noise at Logan. The airport improvement program proposed by Massport is in the interest of all citizens around Boston because it promotes airfield safety and operational efficiencies.

In the interest of time, I will submit a written testimony, and I thank you for the opportunity to be heard this evening.

THE MODERATOR: Next we'll hear from Robert Driscoll, Sr. Following Mr. Driscoll, we'll hear from Terry Trainor from U.S. Airways.

T2.16

MR. DRISCOLL: Good evening. My name is Bob Driscoll, Sr. That's D-R-I-S-C-O-L-L. Please be sure and put down senior because you heard from my son last night who

speaks for himself and he's a member of the Board of Selectmen. I'm the vice chairman of the Winthrop Noise Air Pollution and Airport Hazards Committee.

There's been some statistics and some statements made that I would just like to add some clarification to. Last night, one of your speakers mentioned that Logan needed a fourth runway. Logan Airport has five runways. What Massport is asking for is a sixth runway, and I think this is very important when you realize that the other major airports in our country, most of them do not have five runways. T2.16.1

The three airports that service New York City all have four or less runways. The three airports that service our nation's capital have three runways at the best. I don't know why they think they have to have a sixth runway at Logan Airport when the newest airport in the United States at Denver only has five runways. They also have 50 miles of nothing around them so that they don't bother anybody.

Now, it's important to keep this in mind because Delta Airlines just announced I believe yesterday that they're going to add another 18 flights out of Boston. Delta Airlines' major terminal is Atlanta. Atlanta is also the hub of the southern travel. They have four runways down there. I think that they need to be asked why they think that their answer to their problem is another runway when everybody in the United States has wind. Even in Denver and Iowa, they have wind but they don't have to be building new runways to accommodate it.

Mr. Blute came to Winthrop a few months ago to try to talk us into believing that 14/32 was good for all of us. We, of course, rejected his ideas, but he made some very interesting statements. It was a meeting that went on for four hours and it's all on tape courtesy of WCAT which is our cable network in Winthrop, and if you'd like a copy I'll be glad to give it to you.

Near the beginning of it, Mr. Blute made the statement that we know that Green

and Manchester will reach full capacity in I think he said a couple of years. He gave a time frame. About an hour-and-a-half later, forgetting that he had said that, I guess, he made a comment in regard to somebody else, in which -- I believe it was Mr. Blute -- one of them did make a comment that even if they don't get 14/32, that Logan will increase at 4 percent per year. T2.16.2

THE MODERATOR: Please wrap it up.

MR. DRISCOLL: In other words, gentlemen, other airports reach full capacity but Logan never reaches full capacity. I'll wrap up by saying that this is the double talk that we have had to tolerate not only from this current management at Massport but for the last 25 years, and this is why we're so incensed at their idea that they can do this. In the planning board office in the town of Winthrop on the second floor of town hall --

THE MODERATOR: Thank you, Mr. Driscoll.

MR. DRISCOLL: -- they say on the

plaque that poor planning on your part does not necessarily cause an emergency on our part. Unfortunately, it has caused an emergency because their poor planning is creating havoc for this entire area.

THE MODERATOR: Thank you, Mr. Driscoll. Next we'll hear from Terry Trainor from U.S. Airways, and he will be followed by Richard Rodes.

MR. TRAINOR: Hello. My name is Terry Trainor. I am the general manager for U.S. Airways here locally at Logan, an airline which employs more than 1150 people locally at Logan, and who --

T2.17

THE MODERATOR: I think you need to speak closer to the microphone, Mr. Trainor.

MR. TRAINOR: I represent an airline which employs more than 1150 people locally here at Logan, many of who live in and contribute to the local economy and the communities that are represented here tonight. U.S. Airways, which carried more Boston passengers than any other airline, strongly supports the development of a new

5,000-foot runway and other air side improvements designed to reduce delays at Logan International Airport.

As you know, for many years restricted airfield capacity at Logan has resulted in extensive delays for our Boston passengers. Because of the unbalanced nature of Logan's current airfield layout, the amount of usable runway capacity changes dramatically depending on the direction of the wind can change.

As a result, not only does Boston rank sixth in delays in the U.S., but the occurrence and severity of those delays are particularly unpredictable. In order for U.S. Airways and other airlines to provide reliable and affordable air service, it is important that we are able to operate efficiently. Current airfield limitations at Logan do not permit efficient operations. The resulting delays are costly to the airlines, and also costly and inconvenient for our customers. T2.17.1

As with other major cities,

Boston's future economic health, while dependent in part on having reliable air transportation links to national and international markets, many other cities including Atlanta, Miami, Philadelphia, San Francisco, and Seattle are addressing this challenge by improving runway capacity. To remain competitive, Logan must move forward as well.

I'd like to submit comments from our executive office which also represents my view. Thank you.

THE MODERATOR: Thank you, Mr. Trainor. Now we'll hear from Richard Rodes. He will be followed by Ed Freney from American.

MR. RODES: Thank you. My name is Rick Rodes, R-O-D-E-S. I am chairman of the Public Relations and Citizens Activity Subcommittee of the Winthrop Airport Hazardous Committee, a Winthrop airport issues resolutions activist, and I'm president of CARE, Communities Against Runway Expansion.

T2.18

But most importantly, I'm here because I'm a citizen whose family lives very close to the airport just down the street from one of the runways. Every day of my life and my family's life, we are impacted by Logan Airport. Basically, the quality of our life I have seen change dramatically especially in the last few years. The pollution, the impact of overflights, and the noise is just getting worse.

I won't repeat a lot of the things that everybody else has said and said probably far better than I, but I just brought an illustration for the big picture is this is Massport's 75th anniversary newspaper supplement, and in it they have a very nice map that shows Logan Airport overlaid by Chicago-O'Hare, Dallas-Fort Worth, and Denver.

And Boston-Logan, which serves about 25 million people, over 25 million people, sits on 2500 acres. Comparing that to Denver Airport, which serves 31 million people, just 6 million more than Logan

granted, but not basically on the same scale, that sits on 33,000 acres, over ten times more than Logan.

Think about the impact on the environment of all the traffic that goes into Logan, all the airplane traffic, compared to the same roughly capacity that goes into Denver and Fort Worth. That concentration, and that's what people here are saying, that this is a small urban airport. Denver would cover a range from Revere, Winthrop,, Boston, Chelsea, East Boston, Charlestown, Everett, Roxbury. That is how large Denver is.

We are having roughly the same amount here in Boston. Enough is enough. This is at capacity. I'll wrap up simply by saying on behalf of the Airport Hazards Committee in Winthrop, the Winthrop Air Activities, the people of CARE, my two young children live right beside the airport and my family, I ask you, I beg you, I implore you, and if I may be so bold as a citizen, I direct you to do your job and protect us, protect the environment, please protect us.

Thank you.

THE MODERATOR: Now we'll hear from Ed Freney from American. He'll be followed by Richard Dimes.

T2.19

MR. FRENEY: I'm Ed Freney, the general manager from American Airlines here at Logan Airport. I'm here tonight to underscore American's support for the Massport air side improvement project. We believe that a new unidirectional runway for regional aircraft will benefit all of Logan.

T2.19.1

The new runway will help reduce delays at Logan and allow the airport to operate more efficiently when the winds are northwesterly. This enables the airport to operate a three-runway configuration that is required to handle the demand. A plane that is late in leaving Logan likely will be late in arriving at its destination, and whether we talk about a complex, intensive hub and spoke operation or a tightly-scheduled point between networks, it doesn't take much to throw an entire day's schedule out of whack.

As delays increase, the costs of

providing reliable schedules tend to rise even faster which can result in higher fares, and as anyone who has experienced a crowded, chaotic terminal during a severe weather event knows, any time an airline's capacity is restricted, the quality of service we can offer our customers declines dramatically.

Improving the efficiency of an airline's operation at Logan will also enable the carrier to create much less environmentally-offensive product. With less waiting time on the ground, we'll definitely reduce fuel burning emissions. American has a long, rich history in Boston. We began service back in 1927 with a non-stop flight to New York. The aircraft was a single-engine Falker and it carried six passengers, a pilot, a co-pilot. It took two-and-a-half hours to reach New York.

THE MODERATOR: Excuse me, Mr. Freney. Please everyone, let's keep the catcalls and comments to yourselves. This doesn't add anything, and let's be civil and let each speaker speak. Even though they may

not agree with your opinion, they are entitled to some civility. Continue, Mr. Freney.

MR. FRENEY: Today, American operates more than 70 flights daily, carries thousands of people to destinations throughout the United States, Puerto Rico, London, England, and Paris, France. On June 1st, we'll celebrate two major events at Logan. We'll launch non-stop service to Seattle using a new, next-generation Boeing 737-800, and we'll mark the 40th anniversary of the very first jet flight at Logan.

Today, American is a top carrier at Logan with four-and-a-half million passengers coming through our gates each year and nearly over 2500 American employees that call Boston their home. We need business in Boston. Not only is it our slogan but it's our commitment to providing quality service to our passengers and customers. Building the new runway will help us live up to our commitment. It's good for Logan. It will be good for the airlines that serve Logan.

THE MODERATOR: Next we'll hear from Mr. Dimes, and then we'll hear from Sean Donahue from United.

T2.20

MR. DIMES: My name is Richard Dimes, D-I-M-E-S. I live in the town of Winthrop on Johnson Avenue which borders the airport. In the year 1970, I was then chairman of the Winthrop Board of Selectmen and testified at hearings just like this in opposition to a Massport plan to add two parallel runways to Logan Airport.

At that time, after numerous hearings, protests, and demonstrations as we have gathered you see here tonight, then-Governor Sargent rejected the plan, and his statement at that time was that Logan had reached its capacity and that the environmental impacts on the surrounding communities was such that it could not continue on or enlarge this airport to give it more detrimental effects to us.

Now, I have lived at this location for 29 years, and in all that time I have looked over at the airport and seen the

capacity, I have seen more aircraft coming in by the hundreds or thousands, and I have seen Massport do not one iota to solve our problems.

You have heard mentioned that they were going to take Rhode Island airport, they say Manchester, New Hampshire. They are not Massachusetts airports. They are states other than ours. They're just smart. They're enlarging and robbing our customers, I suppose, but case in point is this. We cannot tolerate -- I'm not going to be around too much longer, I've been around a long time, but I don't want the future generations -- we are a proud community, we have a lot of assets that add to our will to live there.

We don't want to have it affected constantly by an airport who feels they can go unlimited because they don't want to face the fact that other areas of Massachusetts might have to shoulder the burden that we have been shouldering for the last 40 years. I'm a hundred percent against 14/32. Thank you. T2.20.1

MR. DONAHUE: Good evening. My name is Sean Donahue. I'm the city manager with United Airlines in Boston. United has served Logan Airport for 54 years and we employ over 1500 employees here at the airport. United supports the new runway for three critical reasons. T2.21

The first reason is safety. Safety is United's number one core objective, and while Logan is a very safe airport, it is clear that this new runway will make it even safer. In our industry, safety is something we can never be satisfied with nor complacent with, and this runway will improve safety at Boston and at Logan Airport. T2.21.1

The second reason is service. There's no secret that Logan is a very delay-prone airport. That creates great disservice for our customers, and this new runway, in reducing delays, will allow the airlines to serve our customers better and meet their needs. T2.21.2

The third reason is air quality. Again, the delays cause the airlines in many T2.21.3

cases to be out on the runways for 45 to 60 minutes before we're allowed to take off. That obviously creates air quality problems and pollution problems. The new runway will alleviate those issues and be able to improve the pollution in the area and to improve air quality. T2.21.3 (cont.)

In summary, we support the runway for three critical reasons. It will make Logan safer, it will allow us to serve our customers better, and it will improve the air quality and reduce the pollution. Thank you.

THE MODERATOR: Thank you, Mr. Donahue. Next we'll hear from Mr. Ronald Taylor from Charlestown, and he'll be followed by Scott Godfried from the Airline Transport Association.

MR. TAYLOR: My name is Ronald Taylor. I'm a member of the Community Advisory Committee and a member of the technical airport research group. As a technical person, I've listened to this safety issue as it refers to lowering of approach minimum. It is not a safety issue. T2.22

It is an issue of more aircraft being allowed to arrive in more severe weather. The safety issue is the worst the weather, the tougher it is to land.

The next issue, 14/32. The parties from the Federal Aviation Administration and Massport have yet to provide a traffic pattern for that given runway, and to explain what the approach will be, what type of an approach there will be, how the aircraft will be directed to that given runway as it is referred to the combination of 33 left 27. It appears that 27 and 32 will be a conflict and there will be a safety issue. T2.22.1

I would ask Mr. Pugsley to oppose and reject the EIR/EIS for this reason. There is an underlying portion of this inside the 1976 restriction on build-out at Logan. The extension of runway 9, the extension of 4 left, if you allow Massport to have their way, that restriction is lifted and we'll now have runway 9/27 10,000 feet long, runway 22 right or left, 10,000 feet long, and the number 120 operations per hour is fictitious.

It is a fictitious number that Massport would like attain by having 14/32. It is a catastrophe environmentally waiting to happen by allowing them to increase to 220 operations per hour. Thank you very much.

THE MODERATOR: Next we'll hear from Scott Godfried from ATA, who will be followed by Steve Stoddard from Winthrop.

MR. GODFRIED: Thank you. My name is Scott Godfried. I'm the director of the eastern region for the Air Transport Association of America, and we represent 23 major air carrier operators in the United States. Today I am speaking for these airlines, their respective employees, and the passengers and shippers who use Logan International Airport. T2.23

ATA and the airlines serving Boston Logan Airport support the Logan air side improvements planning project in its entirety. As a partner with Massport, local officials, and community representatives throughout the comprehensive process leading to the submission of the draft environmental

impact statement and environmental impact report, we believe that the benefits to be garnered by all parties weigh heavily in support of the project.

The present operational posture within which the airport operates results in significant delays during certain wind conditions. The efficiency of the airport's operation is severely compromised during these times due to the lack of a runway configuration compatible to the operational requirements otherwise addressed by the available runways in all other wind situations.

The obvious solution to this problem is the implementation of Massport's plan which includes the construction of runway 14/32. The ATA cannot stress enough the importance of the reduction of the current level of delays which plague Boston Logan Airport, and the corresponding level of service which we are able to provide to our passengers and shippers utilizing the airport.

T2.23.1

It is our position that the implementation of the entire project will lower the overall noise impact on the surrounding communities. This is due to the unidirectional orientation of the new runway and the efficiency gained which will cause a reduction of delayed late-night operations which currently impact citizens at the most intrusive time of the day. T2.23.2

In fact, tonight I think you're going to see this brought to bear on that example precisely. Right now we are running anywhere up to two-and-a-half hour delays at Boston due to the current situation, and the airlines will be operating later schedules.

Additionally, the air traffic system and pilot operational safety benefits will be realized. A lessening of fuel emissions from delayed aircraft on the ground will also result in associated economic benefits for the greater Boston area will be gained.

THE MODERATOR: Please wrap it up.

MR. GODFRIED: In the interest of

time, the ATA will submit a more detailed presentation of these and all the pertinent items via a written submission to the appropriate state, the MEPA, and the federal FAA agencies. Thank you.

THE MODERATOR: Thank you. Now we'll hear from Steve Stoddard. He'll be followed by Richard Salinni, East Boston.

MR. STODDARD: My name is Steve Stoddard and I'm from the town of Winthrop. I'd like to start off by thanking Rochelle Bennett for her courage in explaining what she did this evening. It was critical to the whole idea of the environmental protection that the neighborhoods and the communities surrounding Logan Airport need from you. T2.24

I'd like to open by saying the EIS, as currently constituted, should be thrown out and reworked with an independent group and be sent back to the public for further comment. As a former frequent business traveler, not once have I thought about the delay time that I was going to encounter at any airport in the United States. It did not T2.24.1

influence my ideas of going to a city to make money even when it was San Francisco who is the number one delayed airport in the country.

I'd like to bring up a little note that some people here should know about about Massport's concerns for our health and the wellness of our families. Somebody from the town of Chelsea had called Massport regarding a move that they had made for their child. They had moved so that the child could have an easier time sleeping as the child is severely autistic. When they brought this up to Massport, Massport said they would look into it.

This week, they received a letter from Massport. The letter enclosed in it had a Wall Street Journal article telling of medication the child should have at night so they could sleep better. We do have copies of it.

Over the next five years, Massport has stated that the flights over my town would be reduced. When asked what the

T2.24.2

impacts of 10, 15, and 20 years are, they have been unable or unwilling to answer. That is totally unacceptable. They promise that the new runway will be unidirectional. The FAA makes that decision, not Massport. T2.24.2 (cont.)

The main reason they want 14/32 is to reduce delays. There is conflicting data that shows Massport may be overstating the delays at Logan. I have asked for a break-out of the reasons for delays but have seen nothing to spell them out. What perçentage of the total delays would not be affected by any new runway; i.e., mechanical delays at the airport, pilots out sick, or flights delayed and then canceled for snow reasons? T2.24.3

Massport has not even followed what the needs are in filing a complete EIS. Below are a couple of items that are severely missing from the document as far as I am concerned. They are all from Chapter 6 of the EIS contents. Section 1502-1, the environmental impact statement shall inform decision-makers and the public of the reasonable alternatives which would avoid or

minimize adverse impacts or enhance the quality of the human environment.

THE MODERATOR: Please wrap it up.

MR. STODDARD: We have seen nothing of that nature. The environmental impact statement should present the environmental impacts of the proposal and the alternatives in a comparative form, thus sharply defining the issues and providing a clear basis for choice. We have seen none of that. T2.24.4

I am advocating enclosing a comprehensive up-to-date study showing all alternatives that are available. We should be looking at Otis Air Force Base, Worcester, Green Field, Hanscom, and further regionalization as well as a new airport to develop a plan that compares what is the best long-term strategy, not a quick, short-term fix.

THE MODERATOR: Thank you, Mr. Stoddard. Richard Salinni, please.

MR. SALINNI: My name is Richard Salinni. I live in the Jeffrey's Point neighborhood of East Boston. I've lived T2.25

there for 47 years. First off, what alarms me the most -- I mean, I could tell you about noise all day long. I mean, I sleep like three hours a night, but what alarms me the most, in my neighborhood of East Boston, they tell me -- I heard Peter Blute, it come right out of his mouth, that there's going to be little, if no, effects on the Jeffrey's Point neighborhood. T2.25.1

Well, I beg to differ with him. According to his chart in Volume 4 of the environmental draft, Appendix M, Table DM1-8, this is on VOCs, right now in 1999, you're around a level of 200. With a higher build in 2010, it goes to 448. There is no place close, not even Eagle Hill, which is going to get 21,000 more flights. They only go to 372 which is still damn high.

I want them to explain to me how they think that goes to 448. Is it something to do with maybe the breeze because these planes have to take off into them that will blow the VOCs back into the community and over the brand new park that we fought 20

years to get? They gave us six acres of park land when they took 71 from Wood Island Park, and now they want to pollute it.

The figures which I gave you which is the highest in the entire chart does not take into consideration background levels which is three tunnel vent buildings, an L Street power plant, and there's also a power station, the boiler plant on the airport. It doesn't even take into consideration those levels. That's number one.

Number two, cost. They talk about cost in delays. Let me tell you about costs. Every time I leave my house it cost me. Did you see this traffic jam out here tonight? I try to get to Revere and it used to take me 15 minutes to get to Revere. It can take me 40 minutes to get to Revere on a Friday night. It's insane. You're talking about costs? It costs me between gas and the insurance, my insurance rates are one of the highest in the state because every time a rental car in the airport gets into an accident, guess whose insurance it counts on?

Mine.

You know the VOCs that come down and spray a nice layer of dust on everything? Well, that nice layer of dust causes me to have to leave my beautiful four-foot slider that I got a beautiful breeze all summer long that I cannot enjoy. It costs me in air conditioning along something like $250 including another hundred on insurance and a hundred extra for gas. What's it cost me? Four hundred and fifty to $500. How do you like that for cost? Times how many people? They talk about costs?

THE MODERATOR: Please wrap it up, sir. T2.25.2

MR. SALINNI: Three, what are they doing to increase use of other airports? They recently hired -- in the March edition of the Airport Journal it says they hired a Wes Harper from Boeing Corp. And what are his duties? The Airport Journal says he would focus on attracting new international airline service to Boston, to Logan.

In wrapping up, I'd just like to

say I seen an interesting anti-smoking commercial this morning at 5 o'clock on TV where it showed elders dying of smoke and children picking it up, and the bottom line was, don't take it personal, it's just big business without a conscience. Thank you.

THE MODERATOR: I'm sorry. I didn't announce the next speaker. I apologize if I mispronounce this name. Joe Palenza. Following him will be Karen Madalina from East Boston.

MR. PALENZA: Good evening. I'm a lifelong resident of East Boston, the Eagle Hill area to be specific. I'm also the chairperson of the East Boston Land Use Council which is one of the oldest councils and committees in East Boston. On March 25th, we had an invitation for Massport to come to our meeting. Not only do we represent the East Boston Land Use Council, we represent the whole East Boston community. At that time, Massport refused to come to our meeting, without any notification, without giving us the reason why, and I think we need

T2.26

an apology for that.

The East Boston Land Use Council voted to oppose the building of runway 14/32, the center field taxiway, and the lowering of the minimum of the height of the approach. Also, the East Boston committee is basically coming closer together on this because at the meeting at Spinelli's that Massport came to, everybody was listening to Mr. Blute going on and on about his rhetoric, whatever he was talking about, I really didn't understand him. T2.26.1

But anyway, I have to thank Mr. Blute and Mr. Cellucci for one thing only, and this is the only time you'll see me thanking them. That's for bringing the East Boston community together more than ever before since I've been around. And also, I want to leave a message for Mr. Cellucci. We do sign your paycheck.

THE MODERATOR: Thank you. Next we'll hear from Karen Madalina, and she will be followed by John O'Connor.

MS. MADALINA: My name is Karen T2.27

Madalina. I'm chairperson of the Jeffrey's Point Neighborhood Association. I'm on the Green Way Council, East Boston Land Use Advisory Council. I'm a lifelong resident of East Boston. I'm opposed to 14/32 and the center field taxiway. The Jeffrey's Point Neighborhood Association had a meeting in February. The Massport Authority came and gave their presentation. Tonight is my fourth time listening to their presentation, and the more they do it, the better they get. T2.27.1

If they had been at the East Boston Land Use Council, then that would have been my fifth time. They are using divide and conquer strategy to try to divide this community, and as Joe said, it hasn't worked. We think that there are other options to runway 14/32 and the center field taxiway. This is also the Jeffrey's Point Neighborhood Association who voted to oppose it. There were 150 people there.

The communities should not be penalized for Massport Authority's poor planning, and them not taking a long-range

approach. Their band-aid approach is unacceptable. We're concerned about the quality of life issues, the environmental impact.

I'm going fast because I just want to reiterate everything that all the other people that are here this evening that have spoke about the environmental impact. We're concerned about the quality of life. We want environmental justice in our community. They talk about soundproofing, but there's noise, air quality that we're concerned about, the health hazards particularly to the elderly, the children. T2.27.2

I made telephone calls to get people to come to this meeting. I spoke to mothers who are concerned, their children have got ear infections, asthma, the elderly with the breathing problems. Dollars cannot -- I'm hearing from all the business people about the cost of dollars. Well, the cost of dollars cannot -- I'm getting nervous now -- but the cost of dollars cannot take the place of the quality of life and the health of the

people that live in our surrounding communities.

One thing that people have said, Logan Airport is like a five-pound bag. You cannot take ten pounds and stuff it into a five-pound bag. We demand environmental justice.

THE MODERATOR: Please wrap it up.

MS. MADALINA: And I'd like to say that the draft EIS and the EIR is inadequate. They use outdated studies and the figures that were used, the FAA modeling did not adhere to the qualifications. Lack of alternative studies. What about Hanscom Airport? I read in the Boston Globe that Blute talked about Worcester Airport. He never mentioned Hanscom Airport. There are other alternatives. T2.27.3

They also take credit for Manchester, using Manchester, Providence. The reason why people go there is because the airlines offer cheaper fares. You can go from Manchester Airport to Texas for $200, whereas if you use Logan Airport, it's $500.

Again, we want environmental justice.

THE MODERATOR: Thank you, ma'am. Now we'll hear from John O'Connor.

T2.28

MR. O'CONNOR: I'm John O'Connor. I'm part of the CARE coalition. I'm here to lend my voice to the neighbors to say no, no way, never, no more to 14/32. Let me just say that I do environmental technology for a living. If anyone ever wants to get bored out of their minds, I have three books I've written on the topic, so I know something about these environmental impact studies.

And I'll tell you, this study isn't worth the paper it's printed on. This study is, at best, intellectually dishonest, and at worst, it's a book of half truths and lies. The CARE coalition is going to submit a very detailed people's environmental impact study to give the neighbors a clue as to what's really going on because this doesn't do it.

But I'll tell you, if you look at the numbers, it reminds me of a book I read in college in a statistics course. It was called How to Lie with Statistics, and I'll

just walk you through some of it and you'll get the detailed written comments later because you can't do it justice in three minutes.

But anyhow, one is, you know, there's talk about the delays. Well, if you really read the numbers in here, the delay situation has gotten better in the last few years, not worse. Number two, if you read FAA statistics, they say there's only a 3 percent delay factor. Massport is saying it's 20 percent. Where does the truth lie? T2.28.1

If you look at the details, this only solves the congestion problem for five years. They're not being intellectually honest about one fact here. They're building the capacity of this airport, and all the studies that they have printed up until this point have talked about moving this airport to handle roughly 20 million to 40 million passengers in the next 15 years and that's the truth. They're expanding this airport to almost double the traffic in the coming years and you don't see that clearly in this T2.28.2

report.

There's little or nothing about these new planes. These new planes are going to be able to accommodate upwards of 500 to 600 passengers and will reduce some of the noise, they say, but the pollution from these new planes is going to be a lot worse. Talk to Boeing about this and they'll give you the nine yards. T2.28 3

THE MODERATOR: Please wrap it up. T2.28.4

MR. O'CONNOR: Finally, there is little or nothing as to how this airport impacts our public health. They care more about -- hey, I'm a bird lover, right? -- but they care more about the birds in this report than they do about the people. What are they going to do with the birds out here? They're going to move the birds to Cape Cod. Hey, are they offering to buy us homes in Cape Cod? No. This report is worthless. Reject it.

THE MODERATOR: Next we have Richard Lynds.

MR. LYNDS: Thank you. My name is T2.29

Richard Lynds, L-Y-N-D-S. My family and I are lifelong residents of the East Boston community, and I'm here this evening as an attorney who's familiar with the environmental review process to talk about the inadequacies of the draft environmental impact statement and impact report. I'm also here to express my opposition to Massport's plan to construct runway 14/32 and the center field taxiway.

Like most of us who live in this community, unlike the many people we've heard who represent the airline industries, we already know that Logan is situated on land ill-suited to house never mind the nation's 16th busiest airport, the nation's 16th busiest bus terminal. Although Massport plans to construct a new runway which promises to place less flights over the surrounding communities, their approach serves only as a temporary band-aid solution to a much bigger problem that they're ignoring. T2.29.1

Massport predicts that passenger

growth at Logan will increase from 25 million or so passengers to 35 or 40 million in the next ten years. Furthermore, operations at Logan which currently peak at 120 per hour are expected to increase as well, and Massport can't deny that. While Massport cites the need for a new runway at Logan to help solve efficiency problems, a better solution might have been something that solved their capacity problems.

And there's no question that a new runway will help increase capacity at Logan. According to the draft environmental impact statement, current flight demand at Logan can be accommodated on three runway configurations with minimal delay. By constructing a new runway, Massport and the FAA will be able to operate many more flights into Logan while keeping delays down to the so-called acceptable level. In my opinion, this is a capacity increase, not an efficiency increase, and it's something the community does not need.

T2.29.2

One thing I couldn't help notice is

part of the scope for the draft environmental impact statement issued in 1995, Secretary Trudy Cox required Massport to examine alternatives of using existing airports instead of constructing a new runway. In fact, she referred to comments which suggested expanding the use of Hanscom Field which is close to Boston and owned by Massport, but the PEIS and the DEIR ignore Hanscom's potential for relieving anything other than general aviation traffic. T2.29.3

Since the ENF was released in '95, the popularity of regional airports such as T.F. Green and Manchester have increased dramatically.

THE MODERATOR: Please wrap it up.

MR. LYNDS: I will. But Massport continues to ignore expanding the use of Hanscom despite the relatively low number of operations at that facility. For more than 25 years, this community has endured the prospect of an additional runway. Massport cites the project will provide improvements to alleviate the arrival and departure T2.29.4

problem, but in the very same breath, they talk about how in order to meet the projected demand of passengers at Logan, a new runway is necessary.

Massport can't have it both ways. It's either efficiency for today or expansion for tomorrow. The communities opposing a new runway at Logan Airport have spoken in a unified and loud voice. We don't want another runway, and we believe that our communities have shouldered the burden long enough.

THE MODERATOR: Thank you, Mr. Lynds.

MR. LYNDS: I'm wrapping up now. As the state and federal agencies responsible for protecting our environmental rights and our environmental justice, I ask that you assess the burden that our community is being asked to face once again, and consider the inadequacies of these documents. I thank you for your time.

THE MODERATOR: Now we'll hear from Mary Berninger. I apologize if I

T2.30

mispronounced your name.

MS. BERNINGER: You did what everyone does. It's Mary Berninger, and it's B-E-R-N-I-N-G-E-R.

THE MODERATOR: Go ahead, Ms. Berninger.

MS. BERNINGER: I live on St. Andrew Road in the Orient Heights section of East Boston.

THE MODERATOR: Before you start, let me announce that the next speaker will be Mary Ellen Welsh from East Boston.

MS. BERNINGER: I'd like to outline for you my reasons for being in strong opposition to the Massport Authority's proposed new runway, otherwise known as runway 14/32, the proposed center field taxiway, and the proposed reduced minimums as they pertain to environmental justice, and I'd like to couch them in terms that have to do with your implied and very, very specific mission statement with regard to protecting the environment.

The existing court ordered

injunction against the runway serves to protect the environmental interest of East Boston residents and should not be overturned. The reasons behind the injunction remain sound. Our community should not be asked to absorb additional negative environmental burdens without all other alternatives having been studied and serious implementation of all alternatives attempted.

Please do not be swayed by the argument that this runway is needed to help alleviate delays at Logan International Airport for the tourist industry or for business travelers coming to Boston. By Massport's own figures, fully 57 percent of all passengers arriving at Logan or departing Logan are residents of communities located west of Route I-95 and Route I-495. T2.30.1 T2.30.2

Clearly, the logic of siting another airport nearer to those residents cannot be denied. Such a new airport would serve to enhance the justice of not allowing more negative burdens here in Boston, and

would bring those passengers closer to their homes.

I would also ask that you consider the impact the airport currently has on the health of residents of East Boston. Our children's overall well-being is being compromised daily by the negative effects of the pollution created by the airplanes and the attendant traffic going to and from Logan. That includes cars, taxis, limousines, buses, and cargo trucks. T2.30.3

The infrastructure of our community cannot withstand additional burdens which would be evident if runway 14/32 is built. Massport's presentations have alluded to the 5,000-foot runway as being primarily for commuter planes and being necessary because of the wind patterns here in Boston, while a runway that is a mere 280 feet short of a mile which can accommodate 100 passenger jets creates an unfair environmental burden on East Boston.

With careful planning, another airport could be designed with a runway

configuration that would take into account all possible wind patterns and the problem would not be duplicated. I live right near the Bays Water Street area, and I am adamantly opposed to the reduced minimums because at the point of deciding to abort the landing, we would be most greatly affected by it, so I want that on record.

For the health and safety of all persons in East Boston who are trying to live a somewhat reasonable quality of life and whom should not be considered expendable to satisfy the needs of the traveling public, I ask that your agency deny Massport's request to sanction runway 14/32, the center field taxiway, and the reduced minimums. Thank you.

THE MODERATOR: Thank you. Next will be Mary Ellen Welsh, and following Ms. Welsh we'll have Tony Gambale.

MS. WELSH: I'm Mary Ann Welsh and I live in the Jeffrey's Point neighborhood of East Boston. I'd like to comment, number one, about the inadequacies in the EIR; and

T2.31

two, about the concept of environmental justice, but before I begin, I would like to address just something that Mr. Saltmarsh said at the very beginning of the hearing.

That was, he was touting the advantages of having the runway because it would send more flights over the water, but in fact, the runway, the flights that go over the water would impact us in East Boston, they would impact the people who are in the seaport district, and all the housing that's along the waterfront now and the new housing that's being proposed including that being proposed by Massport Authority. T2.31.1

The other issue is that while those flights would go over the water, they would, in a certain runway configuration, send twice as many or three times as many off of 27 over Boston Harbor, but then over very densely-populated neighborhoods in Boston and beyond.

And at the other end, it would send three times as many flights over very populated neighborhoods beginning in East Boston's Eagle Hill, and then on to Chelsea,

Everett, Malden, Somerville, and so on. So the advantages of the runway sending flights over the water are not advantages at all for people who live under those other flight tracks.

T2.31.1 (cont.)

We were looking for some experts to look at this document that's under consideration by MEPA. We found a document that was written by the Society of Senior Engineers, and they cited in that document several places where this document is inadequate, and I won't cite them all, but in the CEQ sections including 1502, 1, 2E, 14, 14A, B, C, D, and F, and others which I will give to you in my written comments, where the document doesn't meet environmental regulation standards.

In addition, our community consultants, in their review of the document, use many examples where deficiencies exist in the EIR/EIS. These professional technical experts substantiate and confirm the arguments and positions the community people have made over the years, and especially have

made about the current airport expansion proposal.

This representation of data to substantiate a certain point of view is found throughout the EIR. This is confirmed and illustrated by the community consultants to the CAC.

THE MODERATOR: Please wrap it up.

MS. WELSH: As an example, in Jeffrey's Point with takeoffs on the new runway 14, the day-night contours in the EIR show that the noise level would not reach 60, but yet in another table called times above noises levels, the information contradicts those figures. The times above noise level in the appendix show there would be an increase to the 65 DB threshold under option. T2.31.2

THE MODERATOR: Thank you, Ms. Welsh. Tony Gambale, please. He will be followed by Stephen Brown.

MR. GAMBALE: Good evening. My name is Tony Gambale I live at 169 Condor Street. I was born on this island 61 years ago. I'm a machinist by trade, a pretty good T2.32

machinist. At 61, I still like to learn things. I want to address something to the fine people of Massport.

Why do you want to patch up Massport? The airport's old, it's falling apart. Something that goes around in my head, you've got South Weymouth Naval Air Station which was just abandoned by the government. It's capable of handling B52 bombers. Why is it that nobody once tonight ever mentioned that airport? It's about a 15-minute drive from here and maybe a 10-minute drive from downtown Boston.

As I say, I like to learn. Can anyone from Massport tell me why no one's ever suggested using the South Weymouth Naval Air Station, other than the fact that the people in South Weymouth say they don't want it used as an airport because it will bring the value of their property down? Is that why you don't want to use it? T2.32.1

Why don't you do me a favor? I lived here 61 years. Buy me out and I could move somewhere, I don't know where I'll move

because I was born and raised here, and maybe for the next two or three or four or five years that I got left to life, I won't have to listen to your noise. Easter Sunday morning I turned 61 years old. 5:30 in the morning, the sorties come over. I thought I was in Vietnam. 5 o'clock the planes started.

The evening before that, I went to a vigil mass and I had communion, and there's 5 o'clock in the morning I'm cursing. This went on, may God strike me dead, this went on all morning. Look into South Weymouth. Either that, or buy me out and give me a kick in the ass and get me out of here.

THE MODERATOR: Thank you, Mr. Gambale. Stephen Brown, please. Mr. Brown will be followed by Susan Grogan.

MR. BROWN: How are you doing? My name is Stephen Brown. I'm a resident of East Boston. I was born and raised here, I still live here. I'm also a business owner in the city of Revere, and I want to speak -- I didn't really prepare anything. I figured,

T2.33

let me wing this. But I've listened to a lot of people here and they spoke a lot of concern.

One thing that I've noticed is, I mean, I've got a 15-minute walk, not even, at a slow speed from my house to Wonderland Station. One day, with the chaos of traffic, it took me, no lie, 35 minutes to get from my house to Wood Island Station, three city blocks.

Expanding the runways, you know, you can talk all that jargon you want, you can give me all your reports that you can pay for, but the thing that I see here is we talk about bringing in more -- well, we want to alleviate delays. I won't deny there's delays. I can watch them from my house.

We talk about trying to increase safety down the airport. How many times during the course of a day does it take when a plane comes in for a landing and it gets aborted because maybe someone approaches the runway slow? Maybe that just has to do with management as opposed to traffic. Travel,

yeah, a lot of people come in and out of Boston. They want to come enjoy our historical society here, but unfortunately it's being diminished by the airport.

Back in the early '90s, my house went through the soundproofing fiasco, I'll call it, because it was nothing but a fiasco, and when they were doing my house, I'm saying to myself, something's up, you know. And then I see the park being built down the waterfront, nice park, but I also say, something's up.

You know, it's just kind of sugar coating everything to pacify the people of East Boston, Chelsea, Winthrop, Revere and all the other surrounding communities. In the city of Revere, Route 60 is a major traveled road. It was probably built, God, probably in the '20s to accommodate 20 cars back then. I think it was a runway then.

But the thing is, too, there's a lot of times when people in Revere, and I've spoken on behalf of the people of Revere, argued about fire apparatus trying to get up

Route 60 to North Revere. Traffic is a major issue. Expanding the runways, expanding the size of the buildings is not the issue Massport should be looking at.

Massport should be looking at management control and trying to figure out how are we going to alleviate the problems that exist now before creating more problems? The taxi in the middle, you know, something kind of bugs me there, too, because I remember watching through Cablevision at one point in time when we started cleaning the Boston Harbor, and at one point they were barging all the dirt out, and then at one point they couldn't barge it out because someone was complaining about something.

THE MODERATOR: Try to wrap it up, sir.

MR. BROWN: Sure, no problem. If I remember correctly, they were dumping some of the bottom of the Boston Harbor in between the runways, and if I remember correctly reading in the paper something about PCB or something which is a cancer-causing agent.

I'm no science guy but it's just amazing how much bull could be published and not state the real facts.

I think people would probably work with Massport if Massport was straight and honest with them, but it's come to the point that people have said enough is enough.

THE MODERATOR: Thank you, Mr. Brown. Susan Grogan, please, and following her we'll hear from Anthony Nash. Susan Grogan? Anthony Nash? Is Louis Covino in the audience? I'm sorry, Mr. Nester, I couldn't read your handwriting. You're up.

MR. NESTER: My name is Anthony Nester from East Boston. I'm from the heights here. That's where I live. This morning I wake up and go out on my front porch and what do I smell? Jet A fuel blowing at me from a triple 7 from British Airways. I went in the house, went down the cellar so I could breathe better. T2.34

I'm not trying to get mad. The noise level's got to cool down, get rid of the 27s, get rid of the 737s, and get rid of

the DC8s at 11:30 at night, at quarter of 2 in the morning blasting down the runway. That's it. I've had enough noise level. You people can do it. And another thing. Don't put another runway, please. I'm asking you nicely to chill out, man. That's the way it is.

THE MODERATOR: Louis Covino? Art Flavin from Air Winthrop. Following Mr. Flavin will be Fred R. Moore from Saugus.

MR. FLAVIN: My name is Art Flavin. T2.35
I'm a resident of Winthrop. I live in an area that supposedly isn't anywhere near a flight path, but I'm pretty tired because I got woken up this morning at 5:30, and tonight I won't be able to get to bed until after 11:30 even though the average noise for today is probably way below 65 DB. T2.35.1

But the point that I want to make is we'd like -- I think the proponents would like us to believe that there is some master plan that 14/32 fits into. I don't believe there is a plan, no clear plan anyway. A plan doesn't consist of a nice slide

presentation, of a power plant presentation with a few bullets on it.

I believe that Green and Manchester grew because of market forces. Nobody stepped up ahead of it. A plan means you get ahead of the need, predict the requirements, you put programs and investments in place, and you're there before the need becomes urgent. That didn't happen at those two airports. It happened because Logan is so beyond capacity that people got frustrated with it.

The signs of obsolescence are coming in, as any business could see. As soon as there's another alternative, people are going elsewhere. Now, if there is a plan, I'd like to know what it is. Tell me what you think is going to happen to divert the planes in five or ten years. T2.35.1 (cont.)

How many people are going to be taking high-speed rail? How many people are going to be using city-side air terminals? How many people are going to be using the regional airports? We're even getting

signals that the regional airports are going to max out.

What I can't understand is, it's so obvious that anybody that's done any strategic planning looks at this and says, there isn't one. If there was, people wouldn't be talking about having a blue ribbon commission.

One of the disappointing things is, I wish there were some business people here, how can a business executive responsible for his company and responsible for the jobs in his company, has to look five and ten years in to the future and still support something like this that is so obviously lacking in planning? It's unbelievable.

THE MODERATOR: Please wrap it up.

MR. FLAVIN: What we need to do is start solving the problem. Get off this debate about 14/32, admit the airport is obsolete, divert our efforts to solving the transportation problem.

THE MODERATOR: Fred Moore from Saugus.

MR. MOORE: Thank you very much.

THE MODERATOR: Hang on just as second. Following Mr. Moore will be Anthony Petrucelli from East Boston.

MR. MOORE: This is going to be my only presentation on this issue. I deal with a lot of alternative transportation advocacy in my neck of the woods and I have an uncle who lives in Winthrop on Shirley Avenue and I visit him frequently so I know firsthand the nature of this problem. T2.36

First of all, let's get rid of all the fire and brimstone and neighborhood demagoguery on this issue and talk about what is the larger picture that these people, the proponents of this runway are looking at essentially, the nutshell things. Improved mobility, promoting commerce and prosperity, okay, very noble goals, right?

But I have a way with three words that we could improve mobility, mitigate environmental impacts, and truly address capacity, congestion, and mobility problems for the 21st century, yet this has been

glossed over and fluffed aside as kind of an aside. Three words, people, high-speed rail.

Now, the thing is, when we say we're talking about looking at the alternatives, frankly this crowd on both sides of the aisle I am really disappointed with. Essentially you've been talking about, well, let's put the airport somewhere else. Let's take our problems and put them on somebody else. Everybody has said about how obnoxious a form of transportation that aircraft gas turbine has done to civilization.

But, you know, the people who live in these other places that you have suggested the airport go to are just like you. They don't want it, either. Would you prefer to live a mile from an airport or a train station? Which would have less environmental impact? When we're looking at what will really mitigate and what's the true mobility picture, are we really looking at all the alternatives, or are we just looking at continuing government subsidy of the airline

industry because all the research and development for the aircraft gas turbine is dispense money?

So, you know, you've got the NIMBY factor out there, and locating airports out in the boondocks when there isn't enough critical mass of people to complain about siting is just an engine for suburban sprawl. And do you know that economic development, the new frontier, is not out on 495 in sprawlsville, it is here.

THE MODERATOR: Please wrap it up.

MR. MOORE: I'm a new urbanist and this is what we should be looking at. We should be planning now for more inter-modal transportation, and I'm appealing to you people to get a hold of your state and national legislators to increase funding for high-speed rail. There is no rail trust fund like there is an aviation trust fund. Heckling does not increase your credibility.

THE MODERATOR: Thank you, Mr. Moore.

MR. MOORE: Thank you very much.

THE MODERATOR: Anthony Petrucelli, please.

MR. PETRUCELLI: Thank you. My name is Anthony Petrucelli and I'm a lifelong resident of East Boston and I currently reside at 87 Orient Ave. I just want to first of all thank all of the residents who are here tonight in opposition for this proposal. You are a credit to your community staying out late at night. It's almost 9:30, and you deserve a round of applause for yourselves. So let's give a round of applause for everyone who's here tonight. T2.37

The residents have done a wonderful job in explaining to you why they're opposed based on the air traffic and the environmental impacts. I want to talk briefly about another impact that is directly related to this proposal that no one has touched on.

In order for Massport to build runway 14/32, Massport needs to demolish and relocate two existing air cargo facilities that are located on the current location on

the airport where they want to build runway 14/32. There is a proposal among many right now that will bring an additional 1850 vehicular trips per day to an already over-congested neighborhood of East Boston and its surrounding communities Chelsea and Revere.

Suffolk Downs recently had an article in the real estate section of the Sunday Globe, of all places, not in the metro region, not in the city weekly, it was buried in the real estate section, and it was just a small story, to develop 25 acres of land as airplane facilities. It doesn't make any sense. T2.37.1

I don't understand why Massport can't understand that in order to build this runway, you need to expand into our neighborhoods. That's a point that needs to be made. There's no more room to go. Go elsewhere. Go to Hanscom, go to Worcester, I don't care. There's just nowhere else for you to go and it's self-explanatory, and the need to expand those air cargo facilities is just a detriment to our community. Go over

on Eastern Ave. in Chelsea. There's all kinds of airplane facilities, park-and-fly, car rentals.

Those are the issues that are concerning me as an East Boston resident, not necessarily just the airplanes, the noise. We all live with that every day. Something has to stop. This needs to come to an end. We need to just stop where we are right now. No more airport expansion, period. Not just the runway, no more airport expansion, period.

Airplane facilities, car rentals, that's the air we breathe in our community. That's what you have to see. I don't know how it can be made any more clear. In order for them to expand, they need to come into our neighborhood. That's such an important point that's missed in the air side improvement program proposal that Massport pitches. So thank you, everyone in attendance tonight. Thank you very much.

THE MODERATOR: Mr. Ascolillo.

MR. ASCOLILLO: Good evening. My

T2.38

name is Hugo Ascolillo, and I'm a lifelong resident of East Boston for 71 years. The airport is across the street from my house. The original airport was across the street from my house and I still live there. I heard a lot of things tonight against runway 14/32 and the taxiway and all this, and I agree with it all. There's not much more I can say to it.

I just want to say this, is that I am an expert resident. I know what it is to be a resident at an airport. I don't need statistics to tell me what's good and what's bad about it. Now, I've done a lot of traveling around the world especially Europe in the last 20 years, and every airport, major airport that I went to in Europe from London, Milan, Berlin, Paris, Rome, Athens, every one of these airports have two major airports, and none of them are 10 or 20 minutes from downtown of any one of the major cities that I mentioned. None of them are 10 or 20 minutes, and I never gave any thought about how long it would take me to get to

Rome, Athens, Paris when I got there.

My argument is this. Logan Airport is 75 years old, four years older than me. I feel my age. I want to do a lot of things but my body won't let me do them. Logan Airport, formerly the Boston Municipal Airport, has served Boston, the commonwealth of Massachusetts, the United States of America, and the world in them 75 years.

Let's give Logan a break. She served us in World War II, she served us in Vietnam, she served us over the Cuban missile crisis with B52 bombers, I don't know how many airports can say this, with atomic bombs and hydrogen bombs on its runways, and we never complained about it.

THE MODERATOR: Please wrap it up.

MR. ASCOLILLO: Logan Airport is a grand old dame of airports in New England. Let's treat her with respect. Let her go. Enough is enough.

THE MODERATOR: Next is Thomas McCarthy from East Boston, please. Mr. McCarthy will be followed by Roberta Horn

from East Boston.

T2.39

MR. McCARTHY: My name is Thomas McCarthy, and I'd first like to thank you for coming and staying this late to hear the concerns of the people of this community, but my concern is that you're listening and I certainly hope you are.

I understand it's difficult for you and for Massport to be here, but the reason it's difficult is because the way this issue is being handled and this issue itself is so wrong and so grotesquely unjust. As an environmental protection agency, one of the jobs --

I also came here tonight with this button on as well as this one because I'm also a candidate for a state rep., but I took it off because I don't stand in front you as a candidate for state rep. I stand in front of you as a lifelong resident of East Boston, third generation. I've been around long enough that I remember Wood Island Park. I remember Neptune Road which was a beautiful environmental area, tree-lined, absolutely

gorgeous.

The environmental impact that Logan has had incrementally on this community over the years has been enormous. I'm raising five kids in this community. I hope a couple of them will stay and I'll have a fourth generation of my family living in this community, but I want them to live somewhere that is environmentally sound enough to have a family, to raise a family, to be where you can just live without the constant --

You know, the NIMBY argument that was made, without the constant -- it's not about this being in my backyard because Miss Desrosiers, when she gave her short presentation, she said something and it has to do with environmental justice, because as an environmental protection agency you should be thinking about environmental justice.

She said that the second airport study, it was deemed that it was impossible to build a second airport because of the social and environmental consequences which the areas might suffer. Well, if you built

the second airport, it might handle one-half of the traffic that Logan handles, so how is it that an airport in the suburbs, the white collar suburbs, handling one-half of the environmental impact that we're already bearing in this community is environmentally just and you should just put the entire burden on the blue collar communities that surround Boston. T2.39.1

Environmental justice is something that should be considered, and a second airport bearing one-half of the burden we've been bearing for years is something which should be considered and which the agency should be pushing for. T2.39.2

Also, one last thing is they keep talking about the runway bringing the flights out over the water, and anyone with any common sense will tell you that when you're standing behind a jet, the roar is much louder. I know a little bit about aviation. If you're taking off over the water, it's because the wind is blowing off the water into our neighborhoods, so when those jets T2.39.3

are taking off, the roar of the sound is being carried by the wind even more into our neighborhoods and the fumes are being carried off the water into our neighborhoods, so saying they're going over the water is not doing us any justice because we're still getting the same amount of pollution and noise. Thank you. T2.39.3 (cont.)

THE MODERATOR: Roberta Horn, please. Following Ms. Horn will be Anthony DiBennedetto.

MS. HORN: My name is Roberta Horn. I live on St. Andrew Road in East Boston, and I've lived on the same street for over 62 years. My concern is with this study they're doing. In Volume 1 on Page 2-9, they show a map of all the commercial airlines. Hanscom is not there. There goes their credibility. Misrepresentation by omission. T2.40 T2.40.1

Volume 3 on Page 4, there's a decision about changing the flight. The graph shows Saratoga Street as the last street before the water. Misrepresentation by omission. There are two streets after T2.40.2

Saratoga Street towards the water, St. Andrew Road and Bays Water Street.

They also refer to that little inlet there as Boston Harbor which it technically is, but I've never heard of it, and as a matter of fact, Massport, on their map of the Bays Water Street buffer zone, their own graph, map, or whatever you want to call it, they refer to that narrow body of water as Boston Inner Harbor tidal basin.

T2.40.2 (cont.)

Now, when you tell someone, oh, there's Boston Harbor between Saratoga Street and Boston Harbor, there are two more streets, there's a narrow body of water. It is technically Boston Harbor, but that's a misrepresentation also because it is a tidal basin. I used to swim to the airport from Bays Water Street when I was ten years old and I'm not a strong swimmer.

Also, when they abort the aircraft over the water with all the thrusts, the force of the engine going back into the homes. And they talk about having less pollution with the center field taxiway.

Well, I'll tell you, there's a November taxiway that's near Constitution Beach. They're supposed to have -- I hear this isn't true now -- but they've always had no more than five large jet aircraft on November taxiway.

Any Sunday night in the summer, you can go there between 4 and 7 o'clock and you will see at least 15. They're going to put the center field taxiway. If the planes take off over the water, their rear is going to be towards the Bays Water Street area. They will not have just one plane. They will sit there because the more planes, the more room they can squeeze into -- I'm sorry, I'm a little confused here, but they just put too many planes where they don't belong.

It won't be, oh, two or three planes on the center field taxiway. They will be backed up there just as they are now and just as they are on the November taxiway eery summer that I witness, and Miss Desrosiers knows this from when she was with the noise abatement office.

THE MODERATOR: Please wrap it up.

MS. HORN: Okay. What I want to say, too, is we need to breathe. We need, I need, we need, I need to breathe, I need to live, I need to sleep. We have planes that come over landing on 4 left, I believe. They skim the treetops, and I have videos of this, and people run out of their homes in fear because they're afraid a plane's going to land there. And you can all check my comments to Massport, but we are a working-class area. Are we lesser people? Are we worth less to you? Does the term environmental justice mean anything? It's your decision.

THE MODERATOR: Thank you, Ms. Horn. Anthony DiBennedetto, please. Following him will be David Rudolph from Chelsea.

MR. DiBENNEDETTO: It's DiBennedetto, like Tony Bennett. T2.41

THE MODERATOR: I'm sorry.

MR. DiBENNEDETTO: Just a couple of months ago, I went to St. Martin and in St.

Martin at the airport, it's an old-fashioned style of an airport where you still use the stairs to come down. They don't have that caterpillar that comes out to meet the plane. The plane was just sitting there idling as I came down those stairs, and the stink from that jet engine just idling, I could tell it doesn't use a catalytic converter or run on unleaded gas like the way we are required to use on our automobiles.

I don't know what sort of inspection the Environmental Protection Agency has for airplanes and the amount of pollution that they could spit out, but that's just a quick observation as far as I'm concerned.

I wanted to say something about -- too bad he's not here any more, the man from the Mass. Aeronautics Commission. As far as a second airport goes, he said that the airport that would have been situated out in Fort Devens was too far away and the airlines wouldn't go that far. Out in Colorado, the new Denver International Airport is 40 miles

from Denver. It is a state of the art airport with state of the art technology. Stapleton was a lot closer to the city of Denver. It was practically in Denver. They didn't say, let's build a new runway. They went out and built a new airport, and that's the difference.

We are so far behind here as far as band-aid approach, but let me get into the environmental because we don't have that much time. You know, what I get upset about is when they try to compare the city of Boston with the city of Seattle because they're basically sort of the same size. They are as different as night and day.

The city of Boston was established in the early 1600s and the city streets were designed as cow paths. They are not highways. The North End, East Boston, South Boston, Winthrop, all around the neighborhoods, those streets are not going to get any bigger today, tomorrow, or a hundred years from now. They cannot accommodate the overflow from Logan International Airport.

As far as the Big Dig supposedly trying to relieve some of this congestion, the Big Dig was designed to relieve the congestion that is there now, not for any increase. There's only one lane going to be going one way and the other way, so where's the plan? Where's the infrastructure?

I mean, everybody's talking about thousands of more flights and the delays that we get. What about the delays that we have just trying to get home? What about the delays of the tunnel backed up all the way to the North End? What about the delays in the tunnel backed up all the way on Chelsea Street?

And finally, I want the Environmental Protection Agency not so much, yes, you've got this paperwork. I want you to take a walking tour of the impacted communities to see for yourselves, and let's get by this.

THE MODERATOR: Please wrap it up.

MR. DiBENNEDETTO: And finally, not only am I against 14/32, I'm calling for the

Environmental Protection Agency to cap the existing flights that are there now, no more.

THE MODERATOR: Now we'll hear from David Rudolph, and then we have about an hour and 15 minutes left so I'm going to take a short break for the reporter's sake so he can get his voice back. Mr. Rudolph. T2.42

MR. RUDOLPH: David Rudolph, 3 Eldridge Place in Chelsea, Massachusetts, a member of the Chelsea Green Space and Recreation Committee. The synergistic impacts, this is what concerns some Chelsea residents who believe that Chelsea is in an extremely polluted condition.

Synergistic impacts are errant emissions from petroleum shipping and transfer station procedures, diesel truck exhaust from bulk salt, oil, and air freight terminals that supply the region, and prevailing winds bringing stack emissions from power plants that fall overhead.

In this era, the designated port area zone regulation upon Chelsea Creek allows residents of its banks to bear the

burden of fueling the region's economy. What would prevail that would dump more petroleum distillates overhead? I understand that landing more jet engines over Chelsea will add to the particulate pollutant soup to be inhaled. Chelsea's asthma rates in children rank among the highest in the state along with other airport-impacted areas. Thank you. T2.42.1

THE MODERATOR: Thank you, Mr. Rudolph. We will break now for five minutes. Following the break, Debbie Santiano-McHatton will be first up.

(Brief recess taken.)

THE MODERATOR: We'll get started again. Is Debbie Santiano-McHatton in the room? You are. Hang on just a second until the reporter gets ready. You may proceed.

MS. SANTIANO-McHATTON: Debbie Santiano-McHatton, Beachmont CAC. I'm here tonight on behalf of my community who sits under the bad weather runways 4 and 22 which brings out the point of the lowering of the minimum which is, from what I understand, an T2.43 T2.43.1

FAA concern.

Massport has presented this to us as a 94-hour gain. Well, I invite any one of you who allow this to go through to come to the Beachmont area on a foggy day and watch one of your international flights fly over where we can't see them but only hear them.

Your 94 hours relates approximately to 3,000 flights in inclement weather. We beg of you for our residents not to allow this to happen. We find it inadequate that you did not include this in Volume 1, that it was put into their appendix where many people were only sent out Volume 1 so they have not seen this. T2.43.1 (cont.)

We have asked over and over that you look at the Beachmont Hill again. We are sure that all of you understand that this hill has a school on the top of it. This is not reflected in your report. The pictures still show it without the 50-foot school on it. When you are flying above our heads 500 feet, 50 feet makes a big different.

In your report, you address noise T2.43.2

mitigation stage 3. We find this inadequate. We find that our main concern is excessive traffic and excessive noise. To be exact, 104 decibels. During a day when I received your noise abatement follow-up, we can see that we're at 75, mostly in the 80s, lots in the 90s, and a few in the hundreds. That's excessive and intolerable.

For you to mitigate with us with the stage 3 aircraft is absolutely ludicrous. Stage 3, I believe, you are currently flying at 85 percent. Your aircraft are now stage 3. Those still wake me up at night when you're flying only stage 3 at 10 p.m. 10 p.m. to 12 o'clock at night when you're flying heaviest over our community, we can't sleep. T2.43.2 (cont.)

When we finally do get to sleep, you've got a 4 a.m. flight that wakes us up again. So I'm asking you, please, perhaps to find another way that your airplanes will be no louder than 65 decibels. That would be a true mitigation.

The other thing is we find your T2.43.3

report, and I will wrap it up right here, sir, we find your report inadequate that you've only addressed this in short term. The long term, your growth, far outweighs anything that we might gain in the short term in our community. I thank you for listening.

THE MODERATOR: Now Mr. Bob Strelitz, and following him, Gregory Curci.

MR. STRELITZ: Bob Strelitz. I'm counsel for the East Boston Land Use Council. I was going to make some technically-based remarks but I'm going to leave that to our written comments and just say that my view from reading the draft environmental impact report, the unspoken argument in favor of your project, Betty, is economic. Five billion dollars in economic impact? Yeah. And a hell of a lot of economic and other impact on East Boston. T2.44

The ironic thing is that the economic future of Massachusetts is in these cities, in East Boston with its beautiful waterfront, with its beautiful views, with its potential, with its wonderful people.

This is an inadequate document. It's a mockery of environmental justice.

The economic future of this area and this state is right in Winthrop, East Boston, Chelsea, the old cities that are undergoing such a dynamic revival. Don't you squash this future with this horrible, horrible proposal that makes no sense from an aviation point of view, from an economic point of view, and from a human point of view. Thank you very much.

THE MODERATOR: Mr. Gregory Curci, please.

MR. CURCI: Hi. My name is Gregory Curci. T2.45

THE MODERATOR: Hang on a second. Following him will be Dick Gill.

MR. CURCI: I moved to Winthrop eight years ago, and I am not under the flight path and I am not in the noise abatement zone. I also live in a brick house that the walls are 12 inches thick and it's pretty solid. The other day, however, the other evening at 2 o'clock in the morning, I

was awakened by a very loud airplane taking off as was my six-year-old son came into my room crying.

What I've noticed in the last -- when I first moved to Winthrop, I knew I was going to be living near an airport and that really didn't trouble me much. I knew there was going to be sound, and I did pick a part of the town that was away from much of the most severe impact of the airplanes. However, now one of the things that I'm beginning to notice is the fumes that are coming to my house from the airport, and they never came to my home a few years ago and they do now.

I smell burning rubber from the tires which, by the way, the environmental impact statement doesn't discuss the thousands of pounds of tire rubber. I guess a tire lasts for a hundred landings, six tires or more per plane, 120 landings per hour, we've got six tires on fire constantly at the airport.

Massport has said that they're

going to soundproof 1500 homes. Last year, Winthrop's rate of problems from asthma and breathing problems went up by 130 percent. We're a seaside community, a peninsula surrounded by the ocean, and yet our asthma rate went up. We have no other sources of pollution. There's no industry.

If you walk around Winthrop during the day, there's hardly a car in sight because people leave town. What's happening in Winthrop is we're being impacted by the air pollution from the airport, and we've also been excluded from any real scientific studies of that impact. T2.45.1

And the reason why is because Logan Airport is surrounded by water. The pollution from Logan travels unimpeded. An airport that's inland is surrounded by trees which will absorb some of the sound impact and will also absorb much of the air pollution. However, in Winthrop, at Logan Airport the pollution travels in a laminar flow directly across the water, it goes to Boston, to East Boston, to Winthrop,

whichever the direction the wind takes it at that time in a highly-concentrated form.

This is one of the major problems with the airport. They are talking about increasing the number of flights, and they're saying that they're going to reduce the amount of ground pollution. I don't think that is really correct because every airplane that takes off burns fuel. The more planes, the more problems. T2.45.2

Massport has not spent a single nickel on promoting the regional airport aspect. I don't see a single billboard. The $200,000 that they wanted to spend to silence the people who are suffering from their air pollution and noise pollution problems would be better spent on publicizing Green Airport, on publicizing other airports, and on developing Hanscom Airfield rather than trying to silence us victims because of their overindulgence. Thank you.

THE MODERATOR: Dick Gill, please, and following him we'll hear from Linda Jolliffe. Following Linda Jolliffe will be

Ellie Johnson from East Boston. Thank you very much. So following Ms. Jolliffe will be Mary Ann McIntyre from East Boston.

MS. JOLLIFFE: My name is Linda Jolliffe, J-O-L-L-I-F-F, as in Frank, E, and I reside in Eagle Hill in East Boston. I also for the record want to make it known that I'm also a board member of the Eagle Hill Civic Association, and we voted against the airport expansion. T2.46

The siege Massport is waging upon East Boston and surrounding communities is no less historic than the British threat to burn Boston. Their determination to build runway 14/32 regardless of the devastating environmental and social impact is like the shot heard round the world.

The pollution and the noise resulting from thousands of increased jet aircraft operations promises to increase intolerable living conditions. Massport expects us to close our windows and retreat into some imaginary soundproof cubicle. In effect, to be held prisoners within our own T2.46.1

homes.

Quality of life is the issue. Without it, a healthy community cannot exist. East Boston is experiencing a reverse. Restoration and renewal are going on, activities throughout the community. Future development of our precious waterfront is carefully being studied. The Main Street initiative is spawning new vitality. Green space, an important ingredient for every flourishing urban environment, is taking root.

The Eagle Hill area has recently achieved long-overdue recognition as an important historical site, and is now listed on the National Register of Historic Places. Residents are excited with the development and are deciding to stay and rebuild their neighborhoods.

Massport and supporting business leaders tout an economic boom throughout the area. Not true. Airport expansion in other areas of the country where quality of life was ignored does not economically benefit

affected communities. Instead, people move out, real estate values plummet, businesses suffer, and crime rates increase. In short, many abutting and affected areas suffer depression and decay. The only economic boom belongs to Massport whose revenue-producing design further encroaches upon our treasured island.

THE MODERATOR: Please wrap it up.

MS. JOLLIFFE: Okay. What I'll do is then, Massport claims that building 14/32 would reduce Logan congestion. That statement merely reflects one of the many dishonest assessments Massport is promoting. Thousands of increased jets operating over our area is not environmentally safe. In other words, Massport and Governor Cellucci are willing to devastate the health, sanity, and well-being of our surrounding communities for a project which will benefit virtually no one.

T2.46.2

Governor Cellucci made a statement prior to his recent operation that he is undergoing a procedure to improve his quality

of life. It's a quality of life issue. Isn't it strange that he takes measures to improve his quality of life yet chooses to ignore the quality of life of thousands of citizens affected by noise and pollution?

THE MODERATOR: Thank you, Ms. Jolliffe. Mary Ann McIntyre, please. Barry Powers? Following Mr. Powers, Jess Stuart.

MR. POWERS: Hello. My name is Barry Powers and I'm a lifelong East Boston resident. I wanted to touch base on three issues that I think have been reiterated consistently tonight. First of all is one of the things that they touched base on was the safety issue. I'd like to mention that if you come into the surrounding cities and see the congested bottleneck traffic, you'd be considering the safety of the children and the people that live in the vicinity. T2.47

The second thing is of the delays. I think that right now we are doing good with the delays that we have because if we didn't have the delays, there would be total gridlock in the city. I've lived in all the

areas of East Boston that there are from Orient Heights, right now currently living in Day Square, and I've also lived at the Jeffrey's Point.

In the past five to ten years, it's been practically impossible to calculate where and when you want to be somewhere given the fact that it's within five minutes in your community due to the airport and mostly with the traffic.

Thirdly, environmentally, I wanted to touch base on something that Rochelle Bennett had mentioned earlier. I was just recently diagnosed with Hodgkin's disease which is cancer of the lymph nodes, and normally I would think that wouldn't be such a traumatic thing, but in the past four to six months that I've been going continuously to the Mass. General and seeing all the cancer patients, I have come to the realization that I am one of the few of my age that have this type of thing, and like I says, I have lived in East Boston all my life.

I grew up initially at the Heights up on Flagstone Street, and from what Massport does do, the only thing that they have done since they've taken away Wood Island Park which is offer us the insulating of the windows and stuff like that. First of all, that doesn't help in the summer unless they're going to give us central air as well. That's four of the busiest months of the summer with the highest traffic and everybody has their windows open.

Now, I touched base on the Hodgkin's disease only because environmentally I believe that a whole lot more studies need to be done to find out how traffic that we have at the airport now is affecting the people and the residents in the surrounding communities. Thank you. T2.47.1

THE MODERATOR: Thank you, Mr. Bowers. Jess Stuart? Pamela Smith from Dorchester? Following Ms. Smith, Kathleen McAuley from Winthrop.

MS. SMITH: My name is Pamela Smith and I was appointed by Dorchester Allied T2.48

Neighborhood Association to serve on the CAC representing Dorchester. I'm also one of the original members of CARE, and I'm proud to say that I am a candidate for Boston City Councilor city-wide.

The expansion of Logan Airport must be stopped. The residents of East Boston and all the surrounding communities today suffer an unacceptable level of noise and air pollution. No amount of noise mitigation will solve the problem when windows are open or people want to go outside. No amount of noise mitigation will address the high levels of asthma or other respiratory diseases in this area. T2.48.1

For Boston to be a world-class city, we must support the residents because if we don't support her neighborhoods and her residents, we will have a convention center and a business and industrial park and no neighborhoods in Boston.

It is my opinion that Massport must not waste money building runway 14/32. Instead, they should maximize the use of T2.48.2

airports in Rhode Island, New Hampshire, Bedford, Worcester, and New Bedford while building a new major New England international regional airport at Fort Devens.

Ultimately, the environmental disaster called Logan Airport must cease to exist, returning to Boston and Winthrop the land that is theirs. East Boston deserves this, Dorchester deserves this, and all the surrounding communities deserve this. Therefore, I support the report submitted by the consultant to the CAC and request that you deny the EIR/EIS. Thank you.

THE MODERATOR: Kathleen McAuley from Winthrop. Following Ms. McAuley we'll hear from John Rogers from Winthrop.

MS. McAULEY: I thank you for this opportunity for an ordinary citizen to explain what our daily life is like in Winthrop. I am not an expert, I do not understand all of the statistics, but we live this, and please excuse me if I'm a little nervous. This is the first time in my life I

T2.49

have ever spoken in front of such a group.

Each time the planes fly over my house, my ears begin to ring. On some days, I experience a constant bombardment of noise. I am an adaptable creature so I move from room to room in search of respite. None is to be found.

According to the FAA analysis of noise levels, my house is not in the high noise level zone. Therefore, I am not eligible to have one of my rooms soundproofed. Sometimes I would like to go outside for a walk or do some gardening, but I must time these activities to coincide with the days when the planes are not flying directly overhead.

I am an adaptable person so I wait. However, on some of these safe days, my ears are attacked by the planes which have to fly over my area regardless of the scheduled safe days. When I called Massport to complain of this intrusion to my safe days, I am told that the weather requires the use of that route. I am adaptable, so I go inside.

Since there is a curfew in effect at Logan, I look forward to getting a noise-free night's sleep, but after midnight I am awakened by a deafening noise and a frightening vibration of the house. It's a plane overhead. Apparently, the pilot is unaware of the curfew. I am adaptable, so I put plugs in my ears and pretend that the vibration is rocking me to sleep.

Now Massport wants to put in a new center taxiway, a new runway, lower the ceiling for landing, and continue the increased usage of Logan Airport. I cannot adapt any more. If I do, I will be a near-death, sleep-deprived, depressed individual with respiratory problems as a result of the emissions from the planes flying overhead. T2.49.1

We are working people who are realists. We know that in order to survive, one must respect the delicate balance between the economic development and quality of life. In order to protect ourselves from the environmental dangers of living near the airport, we have adapted our lives. However,

we can no longer adapt. The limit is reached.

Worcester understands this delicate balance and is looking for the economic benefits which will result if their airport is used more. They are ready to adapt to that point, and that point must be respected for them as well --

THE MODERATOR: Please wrap it up.

MS. McAULEY: -- so that they will not suffer excessively from the detrimental effects of noise and air pollution. Please, please protect us from any further noise and air pollution. We, the people, need your help. Thank you.

THE MODERATOR: John Rogers from Winthrop. Following Mr. Rogers will be Fran Riley from East Boston.

MR. ROGERS: My name is John Rogers. I live in the Point Shirley neighborhood of Winthrop. I grew up in the relatively quiet town of Brookline, Massachusetts. After serving in the armed forces during the Vietnam era, I returned and

lived in the relatively quiet neighborhood of Haverhill, Mass. I work in the business community in downtown Boston.

I was not surprised at all to hear the paid representatives of the airlines get up here and promote their business. I work for a large commercial real estate firm that I will leave unnamed for fear of reprisal. But we have lots of major tenants, some that are of major airlines, and I want to tell you, when they're in a high-rise building and their conference rooms get stuffy, they accuse the landlord of that building of not providing good air quality.

We talk about indoor air quality, indoor building air sickness. It's in the Wall Street Journal all the time. What about community pollution? I was amazed and appalled the first time I drove into Winthrop in 1981 looking to make my home there to be convenient to my work. I thought that an airplane had misjudged, it was flying so low, and was actually going to crash and I was going to see it on the 6 o'clock news. I

just couldn't believe it.

So to put a little perspective on it, people stand up here and they get paid lots of money to represent the airlines. If I can get my hands on that pilot flying that plane at 3 a.m. the other morning, it wouldn't be a good scene. Where are our rights? Where they're a tenant in a building, they have a lease. They quote to the landlord, we have the right to the quiet enjoyment of our premises. Go next door to this tenant who's doing construction and tell him they can't do that during normal business hours because it's interrupting with our business.

What about the fact that they're interrupting with our lives, our health? We can't sleep at night. So I'm against this runway. It makes no sense at all. And I will remind you that not too long ago, there was an article and it was on the TV, quite a bit of exposure on the TV, about several aircraft that were sent to an airport in the middle of a big blizzard, and people were

trapped in these airplanes for hours and hours without sanitary bathrooms, without diapers, without water.

THE MODERATOR: Try to wrap it up, please.

MR. ROGERS: They were not allowed to get off the airline. I'm going to wrap it up by telling you the same people in the airline industry that decided to fly those planes into that airport knowing they had a storm are the same people that poor judgment is what this proposal is all about. I'm against it. Thank you.

THE MODERATOR: Fran Riley, please. Following Ms. Riley, we have Martin Kaufman. T2.50

MS. RILEY: I live in Eagle Hill at 193 French Street.

THE MODERATOR: Hang on a second. We'll lower the microphone for you.

MS. RILEY: Okay. I live in the Eagle Hill section of East Boston. I'm going to be really brief with you. However, I would direct these comments to MEPA to listen carefully. Numerous times I requested from

the FAA the point of origin of a plane coming into Logan late which has to be then serviced and refueled which will depart late. I've never received that information, okay?

MEPA needs to hear why I want the information. If we went for eight months in each of the terminals watching the monitors, you will notice those flights are delayed from O'Hare, Los Angeles, Miami, New York. If the flights are late arriving at Logan, it is not 14/32 that has to be built. The FAA has failed at a national level to look at the points of origin of those delays. That is a poor, lame, ignorant excuse and contention to build 14/32. It's an insult. T2.50.1

I would further remind you that there are no children here speaking, but in the spirit of Anna Defronzo and Eleanor Welsh, I would remind you, clean air and clean water. The Wood Island bay marsh continues to be flooded with debris from the airlines. Go down with a boat and take a look at it. Test the water from when they de-ice the planes and find out why those

chemicals are in the Wood Island bay marsh.

When I look out my window, I don't see Apple Island, I don't see Governor's Island, I don't see any of those islands. I see more runways. We don't see any of the things that we once had. They robbed the land and they destroyed the wetlands to put the runways in.

I would remind you that children play recess. How dare you talk about soundproofing. How dare you tell me that the cheap windows you put in my home are good for me. We open our windows, we have barbecues in the summer just like any other person. This is a class issue. This is an environmental injustice. It's social injustice. T2.50.2

I really take exception to the cheap comments that are being made. That document that was filed isn't even on recyclable paper, by the way. I might point that out.

THE MODERATOR: Please wrap it up.

MS. RILEY: I will wrap it up, and

I'm going to wrap it up with saying this to you. You must study environmentally and I think that your environmental study should include a health study that you can document how you can scientifically control wind and its velocity. It cannot be done. The wind will blow from China to Boston, so how does Massport propose to build a new runway and tell me it won't further pollute East Boston and the surrounding communities? T2.50.3

I'm asking you that question to investigate it because I've talked to scientists at M.I.T., I've talked to scientists at Brandeis. They dispute the Massport findings. Those are scientists. They're not people without aviation backgrounds like Mr. Blute and some of the rest of the political appointed cronies that work at Massport. These are people who have degrees in science and I think you need to look at that.

THE MODERATOR: Thank you very much. Martin Kaufman, and then we'll have Blossom Hoag.

T2.51

MR. KAUFMAN: My name is Martin Kaufman. I live at 381 Meridian Street in East Boston. The neighborhood that I live in, if this runway as proposed is built, I'll end up with 21,000 more flights coming over my home every year. During all of these hearings and all of this talk and talk about money and economics and health and everything else, we're supposed to sit here and not take it personally.

T2.51.1

When Christopher up here says, wrap it up quick, does he tell Massport to wrap it up quick? Does he tell the ATA to wrap it up quick? I want you to understand something, Mr. Christopher whatever your last name may be, I take it very personal when people who are paid to protect me and protect my home and protect my environment sit there with this callous attitude that you've got and displayed all night tonight with wrap it up quick, please. I take it very personal.

And I don't care what the economic value is of Massport to Worcester, to Dover, or Denver. I'm telling you what it's going

to do to me, and I'm telling you I'm taking it very personal. And when this report is complete, I'm going to take the statements that you put into it and how you assign this runway very personal, and I'm going to hold each and every one of you very personally accountable for the actions and reports that you give out.

It's my home that's at stake, and I care what happens to it, and I care very, very much when the people who are being paid to protect me have such a callous attitude to me and my neighbors. I'm taking it very personal. Remember that.

THE MODERATOR: Blossom Hoag, please. Then we have Albert Van Buskirk, is it?

MS. HOAG: Hello. I'm Blossom Hoag. I live in Jeffrey's Point of East Boston. Both on my side of my family, my husband's side, we've been here since the 1600s. Everything that I do is for the environmental cause and to keep this world as good a place as I can have for my children

T2.52

and for the generations to come.

I've been involved with the Friends of the Boston Harbor Islands, I'm the chairperson of the Northeast Region of Conservation for the Sierra Club, and I'm on numerous neighborhood organizations. None of these organizations are supporting this project. The Sierra Club alone is over 20,000 people and has voted to ask that this project be declared inadequate for all of its lack of work that has gone into the document. They will have written comments as well.

T2.52.1

It's the hundreds of thousands of people in the city of Boston and surrounding areas that this project would affect, it's the environmental injustice that's being done to these people, to this city, this historical city that is such a wonderful city to walk around in and appreciate, and all the history that we have here, it's the islands where the inner-city people can go out and try to find some peace and some nature to appreciate.

Putting 75,000 planes over those

islands which are just in the process of coming into the National Park system is not a good work. We would like to work on working out a plan for the entire northeast, how to develop it regionally with all the airports, with all the alternatives in transportation, and it's not just airports, it's the rail, it's high-speed anything else that can be done, and the roadways and everything has to be looked at together. It's not only the airport. T2.52.2

It's not that we're saying not in my backyard, put it somewhere else. Everybody has to come to the table. Somebody has to take it. We're all taking it. We're not saying no expansion at Logan. The planes get bigger, you've got more people coming through. All this project is doing in putting more runways and more planes, making it more efficient for the big planes to land on those and put the smaller planes they can land much more quickly, bring much more people through, that's air pollution and traffic pollution in our neighborhoods. T2.52.3

This is not solving the real issue and the real problem that exists throughout New England, and we have to look at it region-wise and not just in one area where you have the most impacted people and the most low-income impacted people.

THE MODERATOR: Please wrap it up.

MS. HOAG: I respectfully ask that you declare this document inadequate. The studies have used old data. There's environmental injustice. They leave out Hanscom and second airport studies. There is a total lack of alternative studies, and they use the various studies to suit their own needs, and so please declare it inadequate, we request. Thank you.

THE MODERATOR: Albert Van Buskirk. I know I didn't get that right. He'll be followed by Michael Herbert.

T2.53

MR. VAN BUSKIRK: Hello. My name is Albert Van Buskirk. I'm a lifelong resident of Winthrop, and I'd like to say that the two issues that Massport is bringing up for the reason of expansion is for

environmental reasons and economic reasons, which I feel are bogus issues. I feel like the reason for the environmental is unfeasible because if you listen to these residents of these impacted communities, you would understand that this is going to create more pollution, increase more noise, and create more traffic. That is unacceptable for our communities. T2.53.1

The other issue, the economics, the only economics behind this is to create more business for big business. This will not help the smaller communities, the smaller businesses. I just see this as big business and big government, what you call a quasi-government agency, as running amok over these residents, and I'm opposed to it, and I feel this is disgusting. Thank you. T2.53.2

THE MODERATOR: Thank you. Michael Herbert, please. He'll be followed by Mike Furlong.

MR. HERBERT: Good evening, gentlemen. My name is Michael Herbert and I'm from Winthrop, Massachusetts. I'm here T2.54

to express my feelings for my friends and family that aren't able to be here. You gentlemen here are about to make a big decision that could adversely affect a lot of people's lives. I'm sure you're smart guys and you know the true meaning of what the word expansion is and what the judgment by permanent court order injunction means.

We live in the hub of the universe. In some ways, I kind of like the airport. It employs a lot of friends and family. Let's face it, it's not going away. Isn't it fair to say that Logan has served Boston and the surrounding communities way beyond Route 495 for the past 50 years? Well, it's about time we fine-tune the hub of the universe for the future, and you can't fine-tune it with just one tool because Bob Villa would just laugh at you.

Logan is not the only tool. We've got New Bedford, Worcester, Hanscom. New Bedford's economy could really use a piece of Massport's 3 trillion dollar piece of pie. Worcester is a hundred percent ready to go.

T2.54.1

Let's spread some of the world's busiest shuttle service to Worcester. Hanscom is right off Technological Highway. That's where half of Logan Airport's traffic comes from and the people around there want it. They will invite the business, the economy, the fuel.

Being the hub of the universe explains why Boston shares with New York the title of the busiest route in the world. New York has three airports, Washington has two airports, and we only have one. If we can fine-tune Massachusetts and spread the wealth and free up Boston's traffic, the Boston work force would work faster, stronger, and be more productive. We could really get the economic blood pumping through the Central Artery.

On my last flight, the woman beside me had a chauffeur picking her up and taking her to Rhode Island, adding another vehicle to our tunnel and our roads, and I know that chauffeur had to pay Massport to enter Logan Airport. It's supposed to be the

commonwealth of Massachusetts, not the massive wealth of Logan's little airport.

THE MODERATOR: Please wrap it up.

MR. HERBERT: On my second-last flight, I sat beside an airline employee that was coming to Boston to discuss the problem of the de-icing chemicals that run off into the storm drains into the harbor where our lobsters, clams, and cod fish live. You want to talk about environment? My house shakes like an earthquake. Have you ever been in an earthquake?

I mean, it really shakes hard. My Anderson windows rattle. I have cracks in my foundation. Babies wake up crying. And you've got mechanics lengthy testing engines at full throttle for minutes and minutes and minutes. I'd like to see a hypertension study done on me.

THE MODERATOR: Thank you, Mr. Herbert.

MR. HERBERT: Give me one more second, please. Jet fuel disperses every 30 seconds 115 times a day, 365 days a year.

Put it all together and you've got Exxon Valdez, Prince Edward Sound.

THE MODERATOR: Thank you, Mr. Herbert.

MR. HERBERT: One more second, please.

THE MODERATOR: We really have to move along.

MR. HERBERT: I know my constitutional rights, and not only do I say no new runway, but 11 p.m. when I have to shut down my stereo, I say Massport, shut down the runways.

THE MODERATOR: Mike Furlong does not appear to be here. Susan Powers? She will be followed by Scott McGovern.

MS. POWERS: My name is Susan Powers. I'm from Winthrop. I live next to runway 4L and the buffer zone, so-called, and I'm not really complaining so much about the noise although the past few weeks there has been an aircraft at 3 a.m. I think I've grown accustomed to that. It's the diesel jet fuel smell.

T2.55

Now, at our last meeting with Peter Blute a few months ago, we asked about the noise, and they said that by the year 2000, all aircraft should be equipped with the level 3, stage 3 aircraft. But with that comes another problem. As Mr. Rodes has said to us, with the stage 3 aircraft, all the equipment that needs, it burns more fuel. I feel this will be detrimental to our community as well.

The reason we live here by Winthrop by the ocean is for the nice sea air smell, the salt air. We're being deprived of that. We're being deprived of clean air. As a citizen, as a mother, as a taxpayer, and a voter, I implore you, please reconsider this. T2.55.1

THE MODERATOR: Scott McGovern.

MR. McGOVERN: Good evening. I would like to introduce myself with a scenario, what could happen at 11 o'clock, 12 o'clock, or 3 a.m. in the morning at my house. Hi, how are you? Oh, good. Yeah, yeah, that one was a little loud. Yeah, that was really loud that time. I live at 36

Broadway Parkway, yeah, Winthrop, yeah. How are the kids? Oh, good, good. All right, well, have a good night.

Now, Dino works for Massport in the noise abatement office, and is one of the most professional people I've ever dealt with at Massport, and I appreciate your group coming here tonight and acting so professionally. No one wants to sit in the den, especially the airlines people. They all got up and left.

But you know what, we live in Winthrop. We love Winthrop, and we're going to stay here. We're not going to get up and leave because we believe in the cause that we live in a great community. I'd just like to bullet a couple of environmental issues because science is a common sense thing.

Over the years, the runways have expanded in greater length. They say they don't, but they have. Trucks of dirt going out in my backyard day in and day out building piles of dirt, it's growing something. I don't know what they call it

but it's growing something. Either that, or it's a figment of my imagination, but that's one item.

The tanks, we have four big fuel tanks that have grown in the fuel farm area. That means more flights are expected. We have more hotels coming in, and the roads are being all switched to accommodate more traffic, so I don't know who's fooling who. I mean, it's like this runway is going to go in and this is all just a formality..

I hope that the runoff from the de-icing, the fuel jet streams that come off the planes, the burning smell of the rubber, the shotguns early in the morning to get the ducks and birds away sound like a ladder thrown against the side of my house. Every morning you hear it, and guess what? The water is getting cleaner, we're getting seals in. That means the fish are coming back, that means the birds are coming back, and we're going to have more and more birds in these estuary areas, and they're going to be shooting this thing off more and more.

In closing, I'd like to make the fairy tale story of Cinderella where the airport is the glass slipper. The airline representatives who left are one of the evil stepsisters. Massport is the other evil stepsister. Cinderella is the environment, a group of communities trying to get together. They're trying to fit their foot in a shoe that doesn't fit, and we need to stop it. If it doesn't fit, Massport must quit. Good night.

THE MODERATOR: Thank you for your indulgence. The only people that are left since we've exhausted the list of people who have not spoken before, so I will now go through the six people who have signed up to speak tonight who spoke last night. If they're still here, I would ask that they be very brief and cover only points that they didn't cover last night. M.J. Quinn.

MS. QUINN: Thank you very much. I'm Mary Quinn. I live on the Chelsea waterfront, and I will keep this brief. I appreciate your patience although I must

T2.56

admit I'm getting pleasure from keeping Massport folks up but it's all in good humor.

I'd like to mention one of the many of Massport data's statistical sins of omission or commission. Massport data's title, quote, Noise Exposure Population by Community, and then it has several communities and it has Chelsea listed as zero noise exposure population, people noise exposure, Chelsea, zero. T2.56.1

Jeremy Crawford was quote in the Globe last Sunday and we're not real happy about that because he talked about the CAC delay report that came out, and he said it was statistical nonsense versus common sense. Noise exposure, population, Chelsea, zero, statistical nonsense. Common sense, this is Chelsea waterfront. This is out of my second-floor window of a three-floor building. They can come in 256 feet, I believe. It's a 40, 50-foot building.

I'm not in the noise as I have zero noise exposure. This is a stealth plane. You can see it but you can't hear it. This

is the end of my street, Admiral's Hill. This particular day I remember it was one every 60 seconds. I can't believe that. I mean, we're not supposed to tailgate cars that close. One every 60 seconds. I counted it. If somebody told me it was one every 60 seconds, I'd say, it can't be. You can't put planes 60 seconds apart. They were that day.

THE MODERATOR: Would you wrap it up, please?

MS. QUINN: Thank you. That is just -- it's talking about the environment, it's talking about many impacts that you've heard, but I just want to mention again and again as everybody else has is that the data that they're using is flawed, there are things missing, it's manipulated.

T2.56.1 (cont.)

To get to the studies and comparisons that they're required to show, they mention a second airport. I'm a little suspicious why that was mentioned. It's a really big project with a lot of environmental impacts and it was shot down out of hand. It's not hard to believe it was

shot down out of hand. It's an awful big project.

But do they put anything in the study about alternatives that do not pollute such as improving the air traffic controllers' electronics which would improve safety, efficiency, and does not pollute at all? Do they talk about studies that they must have done about other airports that have similar delays? T2.56.2 T2.56.3

What are these other airports doing? They're a good business. They must have asked these people how are they doing it. Are these other airports building runways which heavily impact on the natural environment and on millions of people?

THE MODERATOR: Thank you, Ms. Quinn.

MS. QUINN: Thank you.

THE MODERATOR: Christopher Blackford? Mr. Blackford does not appear to be here. Arthur Hartnet? Mr. Hartnet is here. We'll wait for a second until he gets to the microphone. Then Peter Koff.

MR. HARTNET: Good evening again. T2.57
On April 4th of this year, which is just a very short time ago, upon a visit to Castle Island there was a very strong wind blowing from the direction of Logan Airport toward Castle Island. The resulting wind carried an extremely high odor from jet emissions. It was really very obnoxious, and I had never experienced that before so I know firsthand now what the people living very close to the airport experience on a daily basis.

Unfortunately, a lot of the business people have left, and one of my concerns that I didn't really address to them very well last night was the fact that no conscientious businessman that would want to grow his business would rely on a single source of raw materials or labor or any other item, so why do they want to rely on a single airport? It does not make good business sense.

One other item. The acoustical treatment as soundproofing should really be T2.57.1
known as is restricted to 65 decibel yearly

average but only to homes that are up to building codes, and they do not provide air conditioning. Try to live inside a house when it's a very hot, humid day, try not to think about that when you want to use your backyard and you can't because you can't acoustically treat your backyard. T2.57.1 (cont.)

One other item and this is primarily for MEPA. You know, when we were presented, the citizens who work every day, take care of their kids, their dogs, their homes, and run errands to the stores, we don't have the time to really sit down with multiple volumes of documents that we were presented.

You know, I received a document that looked like the Boston White Pages, and that was followed by another document that was a little bit bigger, and then I got three appendices that looked like the Yellow pages, and I said to myself, my God, if I have to swallow all this, I'm really doomed.

The length of documents that are presented to be reviewed should determine the

length of review time that the average citizens have, and I would strongly recommend that the law of the review be changed. If a proponent of a project comes in and they have documents up the ying yang, then the people should be given ying yang time to review these documents. Thank you.

THE MODERATOR: Jeff Buck? He doesn't appear to be here. Ronald Taylor? Mr. Taylor does not appear to be here. That exhausts the list of people that have signed up. Is there anybody who did not sign up who wishes now to speak?

MS. MILLER: I can appreciate the lateness of the hour. I'm Gail Miller. I'm currently the chair of the Conservation Committee. We are submitting written comments but I just want to make a public comment that we are opposed to this proposal, and we will certainly illuminate why in our written documents, and that's all I really have to say. But I would just like to yield 30 seconds to my comrade, Fran Riley, who omitted something.

T2.58

T2.58.1

THE MODERATOR: I'm not going to allow any yielded time.

MS. MILLER: Fifteen?

THE MODERATOR: No. I'm not going to allow any yielded time. The next person in the back who wishes to speak.

MS. RILEY: This is a question I've got for you. Why don't you tell us and why doesn't Massport disclose that more than five major airlines filed waivers with the FAA? It was never told to anybody in this room and that's a fact and it's in Washington. And I think MEPA, Mr. Pugsley, should investigate that fact. T2.59 T2.59.1

THE MODERATOR: Thank you, Ms. Riley.

MS. RILEY: Those airlines are not being in compliance with the stage 2 or 3 aircraft, don't you think that's going to raise pollution? Don't you think that that disclosure should have been made by Massport to all the communities?

THE MODERATOR: Thank you, Mrs. Riley. Anybody else? This gentleman in the

front.

T2.60

MR. CHOQUET: My name is Roland Choquet. I'm with CARE and the citizens organization. I left something out last night when I spoke. Back when Chelsea was induced into receivership, we were allowed to have financial troubles and go into receivership. At that time, Massport was in violation of the FAA standards for pollution at the airport in East Boston and they basically encroached on Chelsea's land and took a huge parcel of land and called it the airport-related overlay district.

Now they have five parking garages there to alleviate the pollution in East Boston from the overabundance of pollution they had. Now we've got some of it, and I'm just wondering how, after hearing all this, Logan Airport can expand to double capacity, but back then during receivership it was called Logan 2000, the program. They were granted double expansion for passenger and freight handling.

If they were at the limit back then

when we went into receivership, and they've taken over five parking garages to alleviate the pollution, how can they double its capacity and still be within the limits of pollution? How can that happen? It's a mystery to me. T2.60.1

Also, their terrorist organization is allowed to tyrannize the people who are trying to get a night's sleep but I mentioned this last night, too. Amnesty International declared that the number one form of torture in the world is sleep deprivation. We've heard again this evening too many people aren't sleeping and it's not right.

THE MODERATOR: Thank you, Mr. Choquet. The gentleman in the center and then I'll go to Mr. McGovern again.

MR. STAMOS: My name is Jim Stamos, S-T-A-M-O-S. I'm from the Squantum section of Quincy on the other side of the bay. Last night at the hearing for Massport at the transportation center, Mr. Cohen from the South Shore Chamber of Commerce spoke very eloquently about his 2500-member organization T2.61

in full support of the 14/32 runway and the center field taxi for economic reasons and the benefit of the businesses.

I am a member of the South Shore Chamber of Commerce and so is another organization that I belong to with over 642 members, and in talking to many of my business associates, none of us were polled by the South Shore Chamber of Commerce regarding our views on this Logan Airport runway. Every time the South Shore Chamber of Commerce has an issue, and they are, as far as I know, one of the most accredited chambers of commerce in the United States, they send out a letter, they send out a poll, what is your view, what is your concern, and nothing was brought from them to any of the members that I know.

I know Mr. Blute did a presentation down there and the board of directors unanimously supported him, but in my city of Quincy, we were told that we asked too late to have a presentation done by Massport and they're now too busy. In talking to several

other South Shore communities, none of them that I have spoken to have had a presentation by Massport, and I don't know how we can make any type of decision, environmental, economic, or otherwise, when everybody south of Boston has not had the presentation. It just doesn't make sense.

I've been involved in environmental issues from Marina Bay and Lot 23, to the Neponset River Watershed Association, Save the Beaches, Save the Bay. We live on the bay. We get the noise. We don't get a lot of the overflights, but we get the noise and the vibrations, and my new home of three years is cracking walls, and the vibration that we get all morning and again all night.

Five planes few over my house tonight from 6 to about 20 minutes past 7, and my wife and I decided that we would get in the car and drive back up here in support of the rest of the residents because it's intolerable.

When we went to a meeting in South Boston at L Street, Mr. Silva from -- I think

that's your name -- said to us that the accuracy of the planes flying in is 68 percent, not a hundred percent. You have to drive 100 percent straight down the highway or you'll crash, and now I know why the planes are flying from Neponset River over Squantum, over Quincy Bay, over West Quincy. It's intolerable.

I really don't understand how we can make and participate in the environmental process through MEPA when we have not had a presentation. I've called my state senator, Michael Morrissey, and our mayor and our city council voted unanimously against this, and we're going to demand that we get a presentation or it's going to be a flawed process. Thank you. T2.61.1

THE MODERATOR: Mr. McGovern, I'm going to give you 60 seconds more.

MR. McGOVERN: Very quickly, this winter I heard a news story where a couple was stranded at the airport because American Airlines were on strike, and the children were getting ready to go to Disney World, and

they sat there in the airport and they came up with an answer to their problem. They rented a limousine and went to Disney World. They got the kids down there.

Boston is a place that is a destination like Disney World. And guess what? People will find a way to come here. If it's not by a plane, it will be another way. So what I think we need to do is get together with the citizens and be good neighbors because they're very creative people, and come up with some solid solutions that everyone can live with.

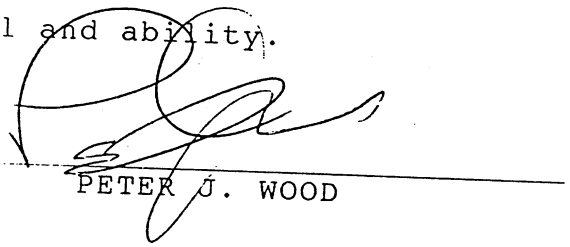
But they're my two heros, I don't know what their names are, but the parents that brought their kids to Disney World.

THE MODERATOR: Thank you all. I'm going to declare this hearing now closed, and that concludes tonight hearing.

(The hearing concluded at 10:50 p.m.)

CERTIFICATE

I, Peter J. Wood, do hereby certify that the foregoing record, Pages 1 through 213, is a complete, accurate, and true transcription of my stenomask tapes taken in the aforementioned matter to the best of my skill and ability.



PETER J. WOOD

THE FOREGOING CERTIFICATION OF THIS TRANSCRIPT DOES NOT APPLY TO ANY REPRODUCTION OF THE SAME BY ANY MEANS UNLESS UNDER THE DIRECT CONTROL AND/OR DIRECTION OF THE CERTIFYING REPORTER.

T2.01.1	Alternatives	Runway 14/32	I think Massport has got an obligation to the people that surround this airport, all the communities that have been mentioned, to do anything they can to lessen the impact on the homes, their residences, their businesses, and their schools, et cetera, in that area...[T]hey will take approximately 75,000 flights over water. To me, that's an improvement to the people in this area...[W]e at MAC owe the support to make sure you'll get this small runway.	Comment noted.

Transcript T2.02 City of Somerville, Bob Haas, Mayor

Code	Topic 1	Topic 2	Comment	Response
T2.02.1	Alternatives	Runway Approach Minimums	[Revere objects to] [t]he proposal...to lower decisional heights for landing on runway 22F[R] in poor visibility weather...With lowering the decision height, the control tower will allow more planes to approach over Beachmont Hill during weather with poor visibility because planes would be allowed to fly closer to the airport before the pilot has to see the hill under worst conditions...Given the already narrow envelope between the existing approach down and the top of Beachmont Hill, an early decision height would increase the potential of a hazard for the Beachmont residents.	Reducing the current landing minimums for Runway 22L at Logan Airport does not equate to a reduction in the existing levels of safety and doesn't change noise levels. Aircraft would follow the same arrival paths, at the same altitudes as today, but the location at which a missed approach decision must be made would be moved closer to the airport. Both Appendix D and Section 3.4 include discussions of reduced minimums. Even under existing approach minimums, aircraft are already beyond Beachmont Hill before reaching the decision height (refer to Section 3.4 of the Supplemental DEIS/FEIR).
T2.02.2	Alternatives	Runway 14/32	We are not totally convinced that the construction of runway 14/32 will result in less air traffic over the city of Revere...It is Revere's opinion that the new runway will increase airport capacity which will obviously result in increased air traffic congestion and additional air traffic over our community.	The new runway at Logan Airport is not proposed to increase the annual capacity at Logan Airport. Rather, it is proposed to reduce delays, particularly on days with strong northwest winds. The Airside Project Draft EIS/EIR analysis shows that this runway also provides more flexibility in runway use, allowing the FAA controllers to adhere more closely to the PRAS goals with attendant benefits to the neighboring communities that are most highly noise impacted The runway will substantially reduce the delays that now occur during northwest wind conditions. Preventing these delays will represent a real benefit to the passengers and airlines that currently experience them. However, because these wind conditions and the associated delays are not regular or predictable, and cannot be readily anticipated by passenger or airlines, it is not expected that their prevention will stimulate growth in Logan Airport passenger demand above and beyond the rates that would have occurred absent the runway. Instead, growth in Logan Airport passenger demand will be principally driven by local and national economic conditions, competition and pricing within the airline industry, and the distribution of airline services and passenger traffic between Logan Airport and the surrounding regional airports. The broad range of forecasts examined in the airside operational and environmental analyses would capture any potential variation in future passenger and aircraft activity at Logan Airport.
T2.02.3	Ground Transportation	Access to Logan	If we are talking about increasing airport traffic, passengers, over the next ten years by almost 20 million passengers, people coming from the north have to go through [Revere]...in order to get to the airport...we in Revere will be in complete gridlock	Neither Massport nor the FAA has a program to increase passenger demand at Logan Airport. Rather, the objective of both organizations is to accommodate demand safely and efficiently. The recommended Airside Project is intended to enable Logan Airport to accommodate current and future aircraft activity with minimum delay. The construction of unidirectional Runway 14/32 would not be expected to induce additional aircraft operations or passenger traffic at Logan Airport. Refer to Section 4.2.

T2.03.1	Noise	Model	The fact is that actual, that is, measured noise results in Chelsea have been year after year above 65, and the predicted number used by Massport to assess the noise impact on [Chelsea]...is below 65...Without an accurate assessment, the true impact of health, environmental, and real estate value effects cannot be clearly defined, making any mitigation offer unreasonable.	The dispersion model portion of the LDMS is an EPA-approved model. The methodology is consistent with FAA and EPA guidelines. Differences between measured and modeled sound levels have been reported in Logan Airport's various GEIRs and Annual Updates for a number of years. Differences at close-in locations were significantly reduced in 1996 through modification of source levels to better account for over-water sound propagation and apparent use of higher engine power settings than are normally assumed in the noise model's database (Refer to Appendix F of the *Logan Airport 1996 Annual Update*). In 1998, differences between measured and modeled noise became even less when Massport upgraded its monitoring system and began to report noise caused only by aircraft -- a metric directly comparable to the DNL exposure levels predicted by the noise model. At sites having exposure levels of 60 dB or more, this improvement to the monitoring system brought measured and modeled DNL values to within 0.2 dB of each other. (Refer to Chapter 5 of the *Logan Airport 1998 Annual Update*). Massport continues to investigate possible causes for remaining differences (such as from hill effects) but believes the FAA's INM noise model used in the Airside Project noise analyses accurately represents expected noise exposure.
T2.03.2	Noise	Model	[T]he noise monitor location, that's [shown on] Figure 5.2-1 on Page 5-13, indicates that there is a permanent noise monitor on Admiral's Hill in Chelsea, while all subsequent analysis of measured noise data is placed on Shirtleff and Essex Street in Chelsea. That's a site that has not had a permanent monitor since 1991, and then for only one year.	Comment noted. Also refer to response to Comment T2.3.1.

Code	Topic 1	Topic 2	Comment	Response
T2.03.3	Noise	Sound Insulation	Chelsea will receive the brunt of the short-term negative impacts of this proposal...In a presentation to the Chelsea City Council on March 3rd, 1999, Massport representatives said runway 33 departures will increase from 4.8 percent to 12 percent of total departures. That's a 150 percent increase. And runway 15 arrivals will increase from 1.5 percent to 7.7 percent. That's a 413 percent increase. The associated increase in noise is large enough that even using the understated predicted noise measures, 1100 homes will be eligible for soundproofing.	While equivalent jet operations increase by more than 50 percent from a 1993 base to the future 37.5M High Fleet scenario if the Preferred Alternative is implemented, the appropriate basis for comparison of the Preferred Alternative is the No Action Alternative. Equivalent jet operations would increase by more than 75 percent over the Preferred Alternative if no action were taken. Despite the increase in equivalent jet operations, the Airside analysis indicates that overall noise impacts decline over time with the elimination of Stage 2 aircraft and the replacement of hushkitted Stage 3 aircraft with non-hushkitted Stage 3 aircraft. By allowing aircraft operations to shift from over-land to over-water routings and by providing greater flexibility in the use of Runways 27 and 33L for takeoff, the Preferred Alternative further reduces the highest noise impacts to the close-in neighboring communities. Furthermore, the Supplemental DEIS/FEIR also demonstrates the more equitable balance of noise impacts among communities surrounding Logan Airport that can be achieved with the Preferred Alternative as opposed to the imbalance that occurs today and would occur in the future if no action is taken. Massport's Noise Rules and FAA-approved sound insulation program have been only two elements of its overall noise abatement program. Massport is currently supporting FAA's effort to improve conformance to the new Runway 27 flight corridor and is exploring means of extending its sound insulation program through innovative investigation of hill effects on sound propagation. Massport is also actively involved in encouraging growth at Worcester Regional Airport and other alternative airports, and is committed to monitoring and improving the PRAS.
T2.03.4	Noise	Sound Insulation	While we feel sound insulation cannot fully mitigate the impacts of increased ambient noise levels, many of the older homes will not be eligible for funding due to FAA order 5100.38A which requires the property owner to bring homes up to code before they pay.	Federal requirements typically exclude the FAA from any responsibility to bring a building up to code when the structure is sub-standard but otherwise qualifies to participate in an airport sponsored sound insulation program. However, to address impacts in particular projects such as the proposed Airside Project, FAA has discretion to use grant funds to bring buildings up to code as part of the mitigation program to the extent such improvement are required to proceed with the sound insulation work. The mitigation program for the Airside Project includes use of grant funds for such purposes. For the eligible residences, the FAA will fund building code improvements, to the extent necessary, to implement effective sound insulation treatment.

Code	Topic 1	Topic 2	Comment	Response
T2.03.5	Environmental Justice	Demographic Data	The EIR's conclusion [that] ["]Given the reduction in the highest noise-exposed population and this mitigation, soundproofing, the low-income and minority populations will not experience disproportionally high adverse impacts in comparison to the affected population as a whole["]...conflicts with President Clinton's environmental justice executive order 1289A... Essentially, the four-page environmental justice analysis contained within the EIR does not adequately analyze the environmental effects including human health, economic, and social effects of the proposed expansion, and I would suggest the analysis is yet another clever obfuscation of the truth, and the analysis in the EIR does not meet the standards of the Department of Transportation order.	The Environmental Justice analysis was expanded for the Supplemental DEIS/FEIR. Low-income and minority populations were defined in accordance with Federal Executive Order 12898, the U.S. DOT Final Order, and the Council on Environmental Quality's guidance on environmental justice. In addition, the analysis of low-income populations was expanded to include households at 150 percent of poverty level. This analysis found that there is no high and adverse disproportionate impact to low-income and minority populations caused by the Preferred Alternative. Adverse impacts are not predominately borne by low-income or minority populations. Only 21 percent of the population within the 65 dB DNL contour for the Preferred Alternative is minority, compared to the Suffolk County minority population of 38 percent. Less than two percent of the population within the 65 dB DNL contour for the Preferred Alternative has a household income less than 150 percent of poverty level. The additional area within the 65 dB DNL noise contour associated with the Preferred Alternative includes a predominately Hispanic neighborhood in Chelsea which is predicted under worst case assumptions to experience an increase of 0.6 dB or less. Under FAA standards, this change is not a significant adverse impact. The minority and low-income populations in South Boston and East Boston affected by the Preferred Alternative 65 dB DNL contour are almost identical to the No Action Alternative. The 65 dB DNL contour for the Preferred Alternative does not extend into Jamaica Plain, Roxbury and the South End. Mitigation of the increased noise within the 65 dB DNL contour will be provided to affected communities in the form of residential sound insulation. A discussion of the Environmental Justice analysis is presented in Section 6.8 of Supplemental DEIS/FEIR.
T2.03.6	Alternatives	Other Non-Construction Alternatives	[A]lternatives under discussion such as comprehensive peak hour pricing analysis using a range of operations per hour levels instead of the single higher operational threshold that underestimates the delay reduction.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR contain an analysis of PPP as a demand management alternative at Logan Airport. The analysis indicates that PPP is an effective option when airlines schedule beyond the normal hourly operating capacity of the airport and provides an assessment of the extent of the benefits from PPP under such circumstances. See Section 4.5.4 of the Supplemental DEIS/FEIR.
T2.03.7	Regional Transportation	Regional Airports	Hanscom should not be ruled out as a piece of the regionalization solution, and a second major airport should have at least been considered.	A second major airport is not a solution to the current delay and congestion problems at Logan Airport. The Proposed Project to reduce delay and enhance safety at Logan Airport must be implemented in the near term to address current and future operating conditions. Even if a second major airport were to be pursued, the planning period for site selection and environmental review would require ten to 15 years, in addition to a multi-year construction period. Rather, Logan Airport is part of a regional system of airports that includes the T.F. Green/Providence, the Manchester, and the Worcester Regional airports. Service development and increased passenger traffic at these airports are an important part of the region's long-term strategy to accommodate passenger and activity growth. Greater use of the regional airports will provide passengers within the service area of such airports with a viable alternative to Logan Airport. Since demand within Logan Airport's primary service area will remain strong, the improvements at other regional airports will not eliminate the need for airside projects at Logan Airport.

Code	Topic 1	Topic 2	Comment	Response
T2.03.8	Noise	Monitoring	Noise and air quality equipment should be along flight paths. Chelsea's air monitors at the Soldier's Home, out of harm's way.	There is a noise monitor located at Shurtleff and Essex Streets on Admiral's Hill in Chelsea. It is essentially directly under the flight corridor for aircraft departing from Runway 33L. It is referred to as Site 15 in tables and text throughout this document.
T2.03.9	Ecosystems	Rare Species	[A] plan to relocate or mitigate [impacts to] the upland sandpiper…is inadequate and also indefinite.	Massport has developed a comprehensive on-site and off-site Upland Sandpiper habitat mitigation plan in close coordination with the Massachusetts Natural Heritage and Endangered Species Program (NHESP) for loss of such habitat at Logan Airport from construction of the Centerfield Taxiway. The plan strives to enhance protection of remaining Upland Sandpiper habitat at Logan Airport without increasing the aviation safety hazards typically associated with birds or hazards to the birds. Additionally, it is expected that an area of former Upland Sandpiper habitat totaling approximately 150 acres at Camp Edwards on Cape Cod will be restored to grassland habitat by removing woody and shrub vegetation to encourage enhancement of the Upland Sandpiper regional population. This restoration effort provides a unique opportunity to expand grasslands in the Commonwealth far exceeding the ±40 acres to be lost at Logan Airport. A Memorandum of Agreement has been signed between Massport and the Massachusetts Army Air National Guard for implementation of the program and long-term maintenance of the area as Upland Sandpiper habitat. Additional details of the Upland Sandpiper mitigation plan are presented in Section 6.5 of the Supplemental DEIS/FEIR. Additional details of the Upland Sandpiper mitigation plan are presented in Section 6.5 of the Supplemental DEIS/FEIR.
T2.03.10	Ground Transportation	Access to Logan	A study of the long-term traffic impacts on the surrounding communities should be as comprehensive as possible.	Implementation of the Preferred Alternative would not increase capacity, but rather it would correct a series of deficiencies in the airfield geometry and operation. Massport's plans to handle the ground access requirements of future passenger levels are discussed in the *Logan Airport 1999 ESPR* (previously GEIR) and its subsequent Environmental Data Reports (Annual Updates).

Code	Topic 1	Topic 2	Comment	Response
T2.03.11	Alternatives	Runway 14/32	[Is there a] commitment to maintain the new runway's unidirectional status?	The Runway 14/32 concept under review in the Supplemental DEIS/FEIR allows unidirectional operations only (*i.e.*, all aircraft arrivals would occur over Boston Harbor to the Runway 32 approach and all departures would initiate from the Runway 14 heading out over Boston Harbor). State approval under MEPA and federal approval under NEPA will allow Runway 14/32 to proceed only on a basis consistent with the stated unidirectional limitations. Consistent with any such approvals, Massport will light and stripe Runway 14/32 to accommodate unidirectional operations only. Furthermore, the location of proposed Runway 14/32 involves physical limitations that reinforce the unidirectional requirements of that improvement concept. The Hyatt Hotel and Conference Center, which is 174 feet high, is within 1,300 feet of the Runway 14. The location of the Hyatt Hotel and Conference Center invades applicable FAA approach surface glide slope requirements, thereby precluding arrivals from the west to the Runway 14. Another factor limiting westerly operations on Runway 14/32 is the lack of available facilities to allow aircraft to taxi to the Runway 32. The unidirectional limitations of Runway 14/32 allow maximum use of over-water operations and thereby limit operational impacts over residential areas. To strictly reinforce these important environmental benefits, Massport has designated the intended unidirectional limitation on Runway 14/32 as a mitigation measure. Refer to Section 8.7 of the Supplemental DEIS/FEIR Draft Section 61 Findings, and the discussion in Section 8.5 of the Supplemental DEIS/FEIR regarding enforcement of unidirectionality of Runway 14/32.
T2.03.12	Analysis Assumptions/ Methodologies	Base Year	...Data used for this analysis is over five years old and does not reflect current conditions	The projections of future airfield delays at Logan Airport are not based on analysis and modeling of delays which occurred during 1993. The analysis for 1993 was included in the Airside Project Draft EIS/EIR to provide historical perspective to the delay problem at Logan Airport and for use in model calibration. The analysis contained in the Supplemental DEIS/FEIR has been updated to include modeled delay results for 1998 to provide more current context to airfield conditions at Logan Airport. Refer to Section 4.2 of the Supplemental DEIS/FEIR for a description of the delay analysis and discussion of current and future delays at Logan Airport.

T2.04.1	Environmental Justice	Cumulative Impacts	I don't think it takes [a lot]...to understand that building this runway before adequate and fair consideration and every single effort is taken to reduce the impact, the negative environmental impact, on the most densely-populated area in New England, one of the poorest areas in New England no matter how you measure it, one of the most racially-diverse areas no matter how you measure it in this country.	The Environmental Justice analysis was expanded for the Supplemental DEIS/FEIR. Low-income and minority populations were defined in accordance with Federal Executive Order 12898, the U.S. DOT Final Order, and the Council on Environmental Quality's guidance on environmental justice. In addition, the analysis of low-income populations was expanded to include households at 150 percent of poverty level. This analysis found that there is no high and adverse disproportionate impact to low-income and minority populations caused by the Preferred Alternative. Adverse impacts are not predominately borne by low-income or minority populations. Only 21 percent of the population within the 65 dB DNL contour for the Preferred Alternative is minority, compared to the Suffolk County minority population of 38 percent. Less than two percent of the population within the 65 dB DNL contour for the Preferred Alternative has a household income less than 150 percent of poverty level. The additional area within the 65 dB DNL noise contour associated with the Preferred Alternative includes a predominately Hispanic neighborhood in Chelsea which is predicted under worst case assumptions to experience an increase of 0.6 dB or less. Under FAA standards, this change is not a significant adverse impact. The minority and low-income populations in South Boston and East Boston affected by the Preferred Alternative 65 dB DNL contour are almost identical to the No Action Alternative. The 65 dB DNL contour for the Preferred Alternative does not extend into Jamaica Plain, Roxbury and the South End. Mitigation of the increased noise within the 65 dB DNL contour will be provided to affected communities in the form of residential sound insulation. A discussion of the Environmental Justice analysis is presented in Section 6.8 of Supplemental DEIS/FEIR.

T2.05.1	Environmental Justice	Impacts	[T]hese things, [the bridge, MWRA, and the new runway] benefit the entire state and region, but instead we're the ones that take the full burden and it's not fair, it's not proper, it's not right.	The population that will be served by the Preferred Alternative is the same population that is currently served by Logan Airport. Approximately 21 percent of passenger traffic is generated within the City of Boston, 29 percent within Route 128 (not including Boston), and 29 percent from the region between Route 128 and I-495. Logan Airport is also a major employer for the metropolitan region with the largest percentage of those employed at Logan Airport (19 percent) living in Boston. Other communities with significant employment at Logan Airport include Revere, Winthrop, Lynn, Peabody, Malden, Saugus, Chelsea, Everett and Salem. These communities account for 49 percent of the employment at Logan Airport.

T2.06.1	Regional Transportation	Regional Airports	Governor Weld appointed a commission to study the regionalization of airports. They came back within six months to a year with a [report] ...recommending that's how we should go in the future. That was years ago and Massport nor the Commonwealth has taken any action on it.	The *Strategic Assessment Report*, completed in July 1993 for the Massachusetts Aeronautics Commission, examined a broad range of scenarios for meeting future high-speed intercity travel demand in eastern and central Massachusetts. The scenarios examined included high-speed rail, use of Air Force bases, use of other regional airports, construction of a new airport, and construction of vertiports. A principal finding of the SAR was, *"Regardless of the type of additional facility element added, the Commonwealth would have to make infrastructure improvements at Logan International Airport if demand growth is to be fully satisfied."*
T2.06.2	Alternatives	Runway 14/32	[Quoted from letter from Edward J. Markey] ..."The construction of the new runway would expand Logan's capacity for operations and increasing current potential for future growth..."	The Preferred Alternative, and specifically unidirectional Runway 14/32, would not increase Logan Airport's normal airfield capacity of approximately 120 operations per hour. This capacity is available at Logan Airport approximately 80 percent of the time. Runway 14/32 would allow Logan Airport to maintain this capacity during periods of strong northwest winds that now require controllers to operate on only one or two runways, compared to the typical three-runway configurations used at Logan Airport. The runway will not increase Logan Airport's normal operating capacity, nor will it encourage or induce an increase in aircraft operations.

Code	Topic 1	Topic 2	Comment	Response
T2.06.3	Regional Transportation	Regional Airports	[Quoted from letter from Edward J. Markey]..."We must examine closely the status of our regional aviation transportation system before we implement any new structur[al] changes at Logan International Airport...It is the responsibility of both the federal and the state governments to devise a strategy that insures some of the burden at Logan is relieved by those regional commercial airports that would welcome increase in regular[ly] scheduled passenger service."	Chapter 2 of the Supplemental DEIS/FEIR provides a discussion of the specific role played by the regional transportation alternatives and steps that Massport has taken to foster use of these alternatives. Massport has long recognized and has been a proponent of options to Logan Airport. Together with the regional airports, Massport has implemented a regional strategy to enhance the use of options to Logan Airport. In the Draft EIS/EIR, Massport identified up to 7.3 million annual passengers that could be absorbed by regional alternatives that include use of T.F. Green/Providence, Manchester and Worcester Regional airports, as well as the new high-speed rail to New York. In the Supplemental DEIS/FEIR, Massport recognizes that these developments will slow Logan Airport's passenger traffic growth. Logan Airport may not achieve the 37.5 million passenger forecasts until after 2010, but rather closer to 2015, and the 45 million passenger forecasts may not be achieved until after 2020. While regional alternatives can play an important role in reducing the rate of future traffic growth at Logan Airport, they do not address Logan Airport's inability to efficiently accommodate current levels of demand during northwest wind conditions. Runway 14/32, which is designed to correct the problem with Logan Airport's layout, is necessary to correct this deficiency and provides clear benefits at current aircraft traffic levels. These benefits will only increase in the future, even as developments at the regional airports act to reduce the rate of future growth at Logan Airport.
T2.06.4	Environmental Review Process	Blue Ribbon Panel	[Quoted from a letter from Edward J. Markey]..."[A] blue ribbon panel should be established to drive such a regional aviation transportation strategy."	In January 2000, in response to the FAA's review of the Draft EIS, the FAA called for preparation of a Supplemental Draft EIS to address specific issues identified by the FAA following input from a SDEIS Panel consisting of six persons. At the FAA's direction, three SDEIS Panel members were appointed by the Governor of the Commonwealth of Massachusetts and three were appointed by the Mayor of the City of Boston. Under the direction of the New England Region FAA, the SDEIS Panel convened in March of 2000 and then met at least monthly with a final meeting in December of 2000. A total of 12 meetings were held. To provide the appropriate background, the SDEIS Panel was presented with an Interim Supplemental Draft EIS, the Draft EIS/EIR, answers to key letters written by members of the public, concerned agencies and public officials responding to the Draft EIS/EIR, and a series of 15 visual and written presentations from the Project's technical consulting team and other independent industry experts.

T2.07.1	Public Health	Effects	How can we consider doing something like [increasing the number of flights out of Logan Airport] without really having scientific evidence? How can we take a chance with people, with people's health, welfare, their very lives, their children's lives? How can we go forward on something like this without doing the necessary health studies...[B]efore this is even considered any farther, I think what we really need to do is we need to go back and we have to do some really detailed analysis, and care about people and the health of people before we start talking about building more runways and having more people coming into the area.	In January 2000, in response to the FAA's review of the Draft EIS, the FAA called for preparation of a Supplemental DEIS to address specific issues identified by the FAA following input from an Panel consisting of six persons. At the FAA's direction, three Panel members were appointed by the Governor of the Commonwealth of Massachusetts and three were appointed by the Mayor of the City of Boston. Under the direction of the New England Region FAA, the Panel convened in March of 2000 and then met at least monthly with a final meeting in December of 2000. To provide the appropriate background, the Panel was presented with an Interim Supplemental Draft EIS, the Airside Project Draft EIS/EIR, answers to key letters written by members of the public, concerned agencies and public officials responding to the Airside Project Draft EIS/EIR, and a series of 15 visual and written presentations from the Airside Project's technical consulting team and other independent industry experts. The other projects cited in this comment are not related to the Airside Improvements Project. Any impacts associated with those projects will be addressed in individual project filings, if required under NEPA and/or MEPA and also in the ESPR (formerly GEIR) process. The ongoing state ESPR process provides information to the federal and state agencies and the general public on the environmental effects of existing and future operations at Logan Airport, on the cumulative effect of airport operations, and on the planning context for individual projects at Logan Airport. The GEIR/ESPR is specifically incorporated by reference in the Airside Project Draft EIS/EIR and Supplemental DEIS/FEIR as a background document. Massport has provided the City of Boston and public health agencies with air quality and emissions data. In January 1996, Massport reviewed available public health data, including mortality and morbidity from each neighborhood in Boston and cancer incidence data available from the Massachusetts Department of Public Health. These data indicated that causal relationships cannot be determined at this time. A review of the 1999 *Report to the Mayor, Health of Boston* prepared by the Boston Public Health Commission leads to a similar conclusion. In addition, Massport has shared the results of the *Soot Deposition Study* with public health agencies and is cooperating with the Harvard School of Public Health on the *South Boston Particle Source Apportionment Study.* Information on public health issues is provided in Chapter 6 of the Supplemental DEIS/FEIR.

T2.08.1	Regional Transportation	Regional Airports	[I]f we allow ...[Massport] to build this runway, we remove all the incentive to look at the other alternatives.	Regional carriers that provide service to Logan Airport and the passengers they serve are an entirely different market than the airlines that and passengers that have generated tremendous growth at the regional airports over the past several years. As a result, regional carriers serving Logan Airport are unlikely to shift operations to the regional airports and the low-fare carriers that provide service from the regional airports are unlikely to shift operations to Logan Airport. Regional carriers serving Logan Airport carry a mix of local and connecting passengers. A significant number of passengers are either traveling to Boston or connecting to flights that are not available from the outlying airports. For example, service to Manchester would not be a viable alternative for a Provincetown passenger traveling to a location in downtown Boston. Likewise, service to Providence would not be attractive to a Provincetown passenger trying to reach Denver, since there are no nonstop Denver services at T.F. Green/Providence Airport. Market forces have been responsible for the shift in airport usage from Logan Airport to the regional airports and the induced growth at the regional airports. Regional airports have become attractive alternatives to Logan Airport because of airline decisions to increase the frequency and quality of regional airport services (i.e., jet versus turboprops), the availability of lower airfares, convenient access relative to Logan Airport, and increased public awareness of the regional airports. Until Southwest Airlines, Delta Express and MetroJet introduced low-fare services into the region, the New England region had been one of the only regions in the United States without a significant low-fare carrier presence. The resulting stimulation of traffic at the regional airports consists of both induced demand and diversion from Logan Airport. This diversion results from a recapture of traffic within Manchester and T.F. Green/Providence airports primary markets that was previously using Logan Airport. Since 1996, when low-fare services were first established at T.F. Green/Providence Airport, eight out of ten new air travelers in New England have chosen to use the regional airports over Logan Airport. Massport considers Logan Airport to be part of a regional system of airports that includes T.F. Green/Providence, Manchester and Worcester Regional airports. Service development and increased passenger traffic at these airports are an important part of the region's long-term strategy to accommodate growth in air travel demand. Refer to Chapter 2 of the Supplemental DEIS/FEIR for a discussion of the roles of Logan Airport and these regional airports in the eastern New England aviation system.

T2.16.1	Alternatives	Runway 14/32	Last night, one of your speakers mentioned that Logan needed a fourth runway. Logan Airport has five runways. What Massport is asking for is a sixth runway, and I think this is very important when you realize that the other major airports in our country, most of them do not have five runways.	To accommodate seasonal on- and off-shore winds, the major runways at Logan Airport are set up at 60 degree angles to each other and have multiple intersections that greatly reduce the capacity of the airport compared to most other major facilities in the country. Also, Logan Airport's fifth runway, Runway 15L/33R, is just 2,557 feet long and can only be used by a few small propeller aircraft so that it does little to help reduce delays. Logan Airport needs the new, more useful Runway 14/32 if it is to improve its delay problems.
T2.16.2	Regional Transportation	Regional Airports	In other words, [it is unclear why]...other [regional] airports [will] reach full capacity but Logan never reaches full capacity.	Airport capacity varies according to weather conditions and traffic volume as well as the airfield layout, facilities and equipment such as ILS, and operational procedures such as approach minimums and aircraft separations.

T2.24.1	Purpose and Need	Delay	...the EIS, as currently constituted, should be thrown out and reworked with an independent group and be sent back to the public for further comment.	In January 2000, in response to the FAA's review of the Draft EIS, the FAA called for preparation of a Supplemental DEIS to address specific issues identified by the FAA following input from an Panel consisting of six persons. At the FAA's direction, three Panel members were appointed by the Governor of the Commonwealth of Massachusetts and three were appointed by the Mayor of the City of Boston. Under the direction of the New England Region FAA, the Panel convened in March of 2000 and then met at least monthly with a final meeting in December of 2000. A total of 12 meetings were held. To provide the appropriate background, the Panel was presented with an Interim Supplemental Draft EIS, the Draft EIS/EIR, answers to key letters written by members of the public, concerned agencies and public officials responding to the Draft EIS/EIR, and a series of 15 visual and written presentations from the Airside Project's technical consulting team and other independent industry experts.
T2.24.2	Analysis Assumptions/ Methodologies	Planning Period	Over the next five years, Massport has stated that the flights over my town would be reduced. When asked what the impacts of 10, 15, and 20 years are, they have been unable or unwilling to answer.	Massport has developed a range of potential future traffic levels for planning purposes. For a variety of reasons, Massport believes that the forecasts described as 1999 and 2010 projections in the *Logan Airside Improvements Feasibility Study, Phase I Report and the DEIS/EIR* will not be achieved until after 1999 and 2010, respectively. The Airport is likely to reach 29 million passengers (formerly the "1999" forecast) in 2003. Developments at the regional airports and Amtrak's high speed Acela Express rail service to New York are expected to further slow Logan Airport's passenger traffic growth. As a result, Logan Airport is now expected to reach 37.5 million passengers in 2015 and 45 million passengers in 2024. Thus the planning forecasts that underlie the delays and environmental analyses cover a planning period that extends beyond 2020. Refer to Chapters 1 and 4 of the Supplemental Draft EIS/Final EIR for a complete discussion of the planning forecasts.
T2.24.3	Delay	Model	The main reason they want 14/32 is to reduce delays. There is conflicting data that shows Massport may be overstating the delays at Logan.	Chapter 4 of the Supplemental DEIS/FEIR contains a discussion on the estimation and modeling of flight delays used in the Airside Project. Chapter 1 and Appendix C include a description of measures used by FAA and U.S. DOT to calculate delay, the limitations of those measures, an explanation of computer models for estimating flight delays, and historical delay data at Logan Airport and other major United States airports. While regional alternatives will relieve traffic growth pressures at Logan Airport, the proposed airside improvements are necessary and provide clear benefits at current traffic levels. These benefits will only increase in the future, even as developments at the regional airports and high-speed rail services act to reduce the rate of future growth at Logan Airport.

Code	Topic 1	Topic 2	Comment	Response
T2.24.4	Environmental Review Process	NEPA	The environmental impact statement should present the environmental impacts of the proposal and the alternatives in a comparative form, thus sharply defining the issues and providing a clear basis for choice...	The improvement concepts evaluated in the Airside Project Analysis evolved from prior studies including the FAA's *Logan Capacity Enhancement Plan* (October 1992); the *Logan Runway Incursion Mitigation Plan/Taxiway Relocation Study* (December 1993); the *Logan Final GEIR* (July 1993); and the *Logan Airside Improvements Feasibility Study, Phase 1 Report*, published in July 1995. The FAA evaluated a numerous physical, operational, and administrative concepts for reducing Logan Airport delays in its *Boston Logan International Airport Capacity Enhancement Plan.* The FAA recommended several improvement concepts, including unidirectional Runway 14/32, for further study. These improvement concepts, as well as concepts from other studies, were individually examined by Massport in the *Logan Airside Feasibility Study*, published in July 1995. Based on the Feasibility study, some concepts were rejected and the most promising concepts were combined into the Alternatives considered in the Airside Project Draft EIS/EIR. The alternatives analysis in the Airside Project Draft EIS/EIR is consistent with state and federal scoping directives for the Airside Project. The results of the Airside analysis indicate that alternatives that include unidirectional Runway 14/32 provide the most benefit in terms of delay reduction and ability to achieve PRAS goals.
T2.24.5	Regional Transportation	Regional Airports	I am advocating enclosing a comprehensive up-to-date study showing all alternatives that are available. We should be looking at Otis Air Force Base, Worcester, Green Field, Hanscom, and further regionalization as well as a new airport to develop a plan that compares what is the best long-term strategy, not a quick, short-term fix.	Massport considers Logan Airport to be part of a regional system of airports that includes the T.F. Green/Providence, Manchester and Worcester Regional airports Refer to Chapter 2 of the Draft EIS/EIR and Supplemental DEIS/FEIR for a comprehensive discussion of regional alternatives.

T2.25.1	Air Quality	Model	I heard Peter Blute...[say] that there's going to be little, if no, effects on the Jeffrey's Point neighborhood. Well, I beg to differ with him. According to his chart in Volume 4 of the environmental draft, Appendix M, Table DM1-8, this is on VOCs, right now in 1999, you're around a level of 200. With a higher build in 2010, it goes to 448.	The highest one-hour level of VOCs (odor indicator) at Jeffries Point will increase from the 1993 level of 225 micrograms per cubic meter ($\mu g/m^3$) to 448 $\mu g/m^3$ under the 45 million passenger scenario of Alternative 1. Notably, average concentrations will be lower than the values above. There are no standards for odor to which to compare this level.
T2.25.2	Regional Transportation	Regional Airports	[W]hat are they doing to increase use of other airports?	Chapter 2 of the Supplemental DEIS/FEIR provides a discussion of the specific role played by the regional transportation alternatives and steps that Massport has taken to foster use of these alternatives. Massport has long recognized and has been a proponent of options to Logan Airport. Together with the regional airports, Massport has implemented a regional strategy to enhance the use of options to Logan Airport. In the Draft EIS/EIR, Massport identified up to 7.3 million annual passengers that could be absorbed by regional alternatives that include use of T.F. Green/Providence, Manchester and Worcester Regional airports, as well as the new high-speed rail to New York. In the Supplemental DEIS/FEIR, Massport recognizes that these developments will slow Logan Airport's passenger traffic growth. Logan Airport may not achieve the 37.5 million passenger forecasts until after 2010, but rather closer to 2015, and the 45 million passenger forecasts may not be achieved until after 2020. While regional alternatives can play an important role in reducing the rate of future traffic growth at Logan Airport, they do not address Logan Airport's inability to efficiently accommodate current levels of demand during northwest wind conditions. Runway 14/32, which is designed to correct the problem with Logan Airport's layout, is necessary to correct this deficiency and provides clear benefits at current aircraft traffic levels. These benefits will only increase in the future, even as developments at the regional airports act to reduce the rate of future growth at Logan Airport.

T2.27.1	Alternatives	Runway 14/32	I'm opposed to 14/32 and the center field taxiway.	Comment noted.
T2.27.2	Environmental Justice	Impacts	We're concerned about the quality of life. We want environmental justice in our community. They talk about soundproofing, but there's noise, air quality that we're concerned about, the health hazards particularly to the elderly, the children.	The available public health studies for communities adjacent to Logan Airport were reviewed and are presented in Section 6.8 of the Supplemental DEIS/FEIR. Public health status reports were available for the City of Boston; however, comparable public health reports were not available from the Public Health Departments of Chelsea, Revere, and Winthrop. A review of the available information did not indicate any causal relationship based on proximity to the airport, nor did it identify hearing loss as a public health concern. Noise was identified as the only off-airport impact from the Preferred Alternative with the potential for environmental justice impacts. The environmental justice analysis found no disproportionately high and adverse impacts to low-income and minority populations from direct project impacts. However, because the area added to the 65 dB DNL contour is primarily within the City of Chelsea, other environmental and health issues were also considered in an effort to assess other cumulative or multiple adverse exposures. Refer to Section 6.8 of the Supplemental DEIS/FEIR for additional information. No alternatives violate the NAAQS. The Preferred Alternative shows better air quality results than the other alternatives.

Code	Topic 1	Topic 2	Comment	Response
T2.27.3	Regional Transportation	Regional Airports	What about Hanscom Airport? I read in the Boston Globe that Blute talked about Worcester Airport. He never mentioned Hanscom Airport.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR, specifically considered the role of Hanscom Field in the analysis of regional alternatives. Hanscom Field, which serves as a general aviation reliever airport to Logan Airport, already accommodates a significant number of aircraft operations (183,000 operations in 1998). The Hanscom Field activity includes private, business, charter, and air taxi operations that might otherwise use Logan Airport. Since the Airside Project Draft EIS/EIR was filed, Shuttle America, a newly founded airline, began commercial scheduled operations at Hanscom Field, offering limited turboprop services to short-haul regional markets – Trenton, Buffalo, Hartford (discontinued), Wilmington, Delaware (discontinued), and Greensboro. Shuttle America is also conducting operations between Hanscom and New York LaGuardia Airport. While Massport supports commercial service at Hanscom Field consistent with its established limits (60 seat regulation), Massport believes that Hanscom Field will maintain its role as a major general aviation reliever, and that its geographic proximity to Logan, Worcester Regional and Manchester airports will prevent its development as a significant commercial airport. Additionally, commuter airlines serving Logan Airport are unlikely to move a significant number of flights from Logan Airport to Hanscom Field, since approximately 50 percent of passengers on Logan Airport's commuter flights connect to other Logan Airport flights and a significant number of passengers are travelling to Boston. However, any new commercial service initiatives proposed for Hanscom Field shall be reviewed for consistency with the *Hanscom GEIR* (HGEIR) and its Annual Updates, and shall be considered by the Hanscom Area Town Selectmen (HATS). Refer to Section 2.6 of the Supplemental DEIS/FEIR for a discussion of Hanscom Field. Since 1995, Massport has worked closely with the City of Worcester to aggressively market the Worcester Regional Airport to airlines. Massport increased its involvement with the Worcester Regional Airport by assuming operational responsibility of the airport on January 15, 2000. By its agreement with the City of Worcester, Massport could assume ownership of the Worcester Regional Airport by 2005. On February 1, 2000, Delta Connection began serving Worcester Regional Airport with two daily nonstop roundtrip flights on regional jet aircraft to Atlanta. On July 6, 2000, American Eagle began service to New York JFK Airport with three daily nonstop roundtrip flights on turboprop aircraft. Massport is in ongoing discussions with other carriers regarding potential new services at Worcester Regional Airport. In addition, MassHighway is analyzing alternative highway routes that would improve surface access from I-90 and I-290 to the Worcester Regional Airport and filed an ENF in December 1999 and is in the process of preparing a Draft EIS/EIR, which is expected to be filed in October 2001.

Code	Topic 1	Topic 2	Comment	Response
T2.28.1	Purpose and Need	Delay	[T]here's talk about the delays. Well, if you really read the numbers in here, the delay situation has gotten better in the last few years, not worse...[I]f you read FAA statistics, they say there's only a 3 percent delay factor. Massport is saying it's 20 percent. Where does the truth lie?	Logan Airport flight delays, as measured by the FAA, did decline between 1993 and 1997. Nevertheless, the same data show that Logan Airport was consistently ranked as one of the nation's most delayed airports throughout this period. In 1998, delayed flights at Logan Airport, as reported by the FAA increased by more than 30 percent, and continued to increase in 2000. In 200, Logan was the second most delayed airport for arrivals in the U.S. This represents the worst delay ranking in Logan's history. Refer to Chapter 1 of the Supplemental DEIS/FEIR for a discussion of Logan Airport delays caused elsewhere in the system. There are three reasons for the decline in delays between 1993 and 1997. First, in 1997, the number of hourly scheduled flights was less than Logan Airport's normal operating capacity of 120 flights per hour, unlike 1993, when airlines scheduled flights well beyond Logan Airport's hourly capacity. Second, Logan Airport's hourly demand profile is flatter than it was in 1993. Airlines are spreading scheduled flights throughout the day taking advantage of Logan Airport's off-peak hours (*e.g.*, 10 AM to 1 PM). Finally, airlines are carrying more passengers per flight. In fact, with roughly the same number of flights as in 1993, Logan Airport accommodated over 3 million more passengers. One reason for this is that the regional carrier network serving New England is more efficient. In 1993, there were three regional carrier systems serving 2.1 million regional passengers at Logan Airport. Since 1994, Logan Airport has been served by two regional airline systems (Business Express, now American Eagle, and US Airways Express). These carriers handled 2.2 million Logan Airport passengers in 1998. Key lessons learned from this are: 1) while PPP might work in conditions of overscheduling, such as the 1993 environment, because there is no sustained period of flight overscheduling at Logan Airport today, PPP would not provide meaningful delay reduction in the current operating environment; and 2) while delays declined from 1993 to 1997, Logan Airport continued to be one of the most delayed airports in the country because, even though carriers were more efficient at scheduling flights, delays caused by wind and weather continued to occur.

Code	Topic 1	Topic 2	Comment	Response
T2.28.2	Purpose and Need	Airfield capacity	They're building the capacity of this airport...They're expanding this airport to almost double the traffic in the coming years and you don't see that clearly in this report.	Implementation of the recommended Airside Project, specifically unidirectional Runway 14/32, would not increase Logan Airport's normal airfield capacity of approximately 120 operations per hour. This capacity is available at Logan Airport approximately 80 percent of the time. Runway 14/32 would allow Logan Airport to maintain this capacity during periods of strong northwest winds that now require controllers to operate on only one or two runways, compared to the typical three-runway configurations used at Logan Airport. The runway would substantially reduce the delays that now occur during northwest wind conditions. Preventing these delays would represent a real benefit to the passengers and airlines that currently experience them. However, because these wind conditions and the associated delays are not regular or predictable, and cannot be readily anticipated, it is not expected that their prevention will stimulate growth in Logan Airport passenger demand above and beyond the rates that would have occurred without the runway. Instead, growth in Logan Airport passenger demand will be principally driven by local and national economic conditions, competition and pricing within the airline industry, and the distribution of airline services and passenger traffic between Logan Airport and the surrounding regional airports. The broad range of forecasts considered in the Airside Project operational and environmental analyses capture any potential variation in current and future passenger and aircraft activity at Logan Airport.
T2.28.3	Air Quality	Fleet Mix	There's little or nothing about these new planes. These new planes are going to be able to accommodate upwards of 500 to 600 passengers and will reduce some of the noise, they say, but the pollution from these new planes is going to be a lot worse.	So-called New Large Aircraft (NLA) carrying up to 1,000 passengers are still just in the discussion phase. No manufacturer has undertaken serious development of such aircraft yet, which would be a multi-year process. These aircraft would probably require modifications to existing airport jetways and apron areas along with increases in taxiway width and turning area. Their use would be limited to extremely high-density markets, and it is not likely that Boston would be among these. In fact, the number of "jumbo jets" serving Logan Airport has declined in recent years. Consequently, the NLA was not included in the Future Fleet scenarios.
T2.28.4	Public Health	Effects	Finally, there is little or nothing as to how this airport impacts our public health.	Massport has provided the City of Boston and public health agencies with air quality and emissions data. In January 1996, Massport reviewed available public health data, including mortality and morbidity from each neighborhood in Boston and cancer incidence data available from the Massachusetts Department of Public Health. These data indicated that causal relationships cannot be determined at this time. A review of the 1999 *Report to the Mayor, Health of Boston* prepared by the Boston Public Health Commission leads to a similar conclusion. In addition, Massport has shared the results of the *Soot Deposition Study* with public health agencies and is cooperating with the Harvard School of Public Health on the *South Boston Particle Source Apportionment Study.* Information on public health issues is provided in Chapter 6 of the Supplemental DEIS/FEIR.

Code	Topic 1	Topic 2	Comment	Response
T2.29.1	Purpose and Need	Delay	Although Massport plans to construct a new runway which promises to place less flights over the surrounding communities, their approach serves only as a temporary band-aid solution to a much bigger problem that they're ignoring. Massport predicts that passenger growth at Logan will increase from 25 million or so passengers to 35 or 40 million in the next ten years...[O]perations at Logan which currently peak at 120 per hour are expected to increase as well...While Massport cites the need for a new runway at Logan to help solve efficiency problems, a better solution might have been something that solved their capacity problems.	Neither Massport nor the FAA has a program to increase passenger demand at Logan Airport. Rather, the objective of both organizations is to accommodate demand safely and efficiently. The recommended Airside Project is intended to enable Logan Airport to accommodate current and future aircraft activity with minimum delay. The construction of Runway 14/32 would significantly reduce delays associated with northwest wind conditions, but would not be expected to induce additional aircraft traffic or passenger activity at Logan Airport. Refer Section 4.2. The availability of Runway 14/32 is projected to produce a small improvement in air quality from improved efficiency of airfield operations.
T2.29.2	Alternatives	Runway 14/32	By constructing a new runway, Massport and the FAA will be able to operate many more flights into Logan while keeping delays down to the so-called acceptable level. In my opinion, this is a capacity increase, not an efficiency increase...	Refer to response to Comment T2.29.1.
T2.29.3	Environmental Review Process	MEPA	[T]he scope for the draft environmental impact statement issued in 1995, Secretary Trudy Cox required Massport to examine alternatives of using existing airports instead of constructing a new runway. In fact, she referred to comments which suggested expanding the use of Hanscom Field which is close to Boston and owned by Massport, but the DEIS and the DEIR ignore Hanscom's potential for relieving anything other than general aviation traffic...Massport continues to ignore expanding the use of Hanscom despite the relatively low number of operations at that facility.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR, specifically considered the role of Hanscom Field in the analysis of regional alternatives. Hanscom Field, which serves as a general aviation reliever airport to Logan Airport, already accommodates a significant number of aircraft operations (183,000 operations in 1998). The Hanscom Field activity includes private, business, charter, and air taxi operations that might otherwise use Logan Airport. Since the Airside Project Draft EIS/EIR was filed, Shuttle America, a newly founded airline, began commercial scheduled operations at Hanscom Field, offering limited turboprop services to short-haul regional markets – Trenton, Buffalo, Hartford (discontinued), Wilmington, Delaware (discontinued), and Greensboro. Shuttle America is also conducting operations between Hanscom and New York LaGuardia Airport. While Massport supports commercial service at Hanscom Field consistent with its established limits (60 seat regulation), Massport believes that Hanscom Field will maintain its role as a major general aviation reliever, and that its geographic proximity to Logan, Worcester Regional and Manchester airports will prevent its development as a significant commercial airport. Additionally, commuter airlines serving Logan Airport are unlikely to move a significant number of flights from Logan Airport to Hanscom Field, since approximately 50 percent of passengers on Logan Airport's commuter flights connect to other Logan Airport flights and a significant number of passengers are travelling to Boston. However, any new commercial service initiatives proposed for Hanscom Field shall be reviewed for consistency with the *Hanscom GEIR* (HGEIR) and its Annual Updates, and shall be considered by the Hanscom Area Town Selectmen (HATS). Refer to Section 2.6 of the Supplemental DEIS/FEIR for a discussion of Hanscom Field.

Code	Topic 1	Topic 2	Comment	Response
T2.29.4	Purpose and Need	Delay	Massport cites the project will provide improvements to alleviate the arrival and departure problem, but in the very same breath, they talk about how in order to meet the projected demand of passengers at Logan, a new runway is necessary. Massport can't have it both ways. It's either efficiency for today or expansion for tomorrow.	The Preferred Alternative, and specifically unidirectional Runway 14/32, would not increase Logan Airport's normal airfield capacity of approximately 120 operations per hour. This capacity is available at Logan Airport approximately 80 percent of the time. Runway 14/32 would allow Logan Airport to maintain this capacity during periods of strong northwest winds that now require controllers to operate on only one or two runways, compared to the typical three-runway configurations used at Logan Airport. The runway will not increase Logan Airport's normal operating capacity, nor will it encourage or induce an increase in aircraft operations.

T2.30.1	Purpose and Need	Delay	Please do not be swayed by the argument that this runway is needed to help alleviate delays at Logan International Airport for the tourist industry or for business travelers coming to Boston.	Runway 14/32 would serve to reduce delays under northwest wind conditions when arrivals are restricted to a single arrival stream. These reduced delays would benefit all users of the airport, not just tourists and business travelers from out of town. Local business travelers and residents would share in the benefits, and the Supplemental DEIS/FEIR has demonstrated that construction of the runway would also provide local environmental benefits in terms of increased PRAS goal compliance and increased over-water flights.
T2.30.2	Regional Transportation	Regional Airports	By Massport's own figures, fully 57 percent of all passengers arriving at Logan or departing Logan are residents of communities located west of Route I-95 and Route I-495. Clearly, the logic of siting another airport nearer to those residents cannot be denied. Such a new airport would serve to enhance the justice of not allowing more negative burdens here in Boston, and would bring those passengers closer to their homes.	The MassHighway is analyzing alternative routes that would improve surface access from I-90 and I-290 to the Worcester Regional Airport. MassHighway is in the process of preparing the EIS/EIR for these highway improvements. Massport supports this project.
T2.30.3	Public Health	Effects	I would also ask that you consider the impact the airport currently has on the health of residents of East Boston. Our children's overall well-being is being compromised daily by the negative effects of the pollution created by the airplanes and the attendant traffic going to and from Logan.	Massport has provided the City of Boston and public health agencies with air quality and emissions data. In January 1996, Massport reviewed available public health data, including mortality and morbidity from each neighborhood in Boston and cancer incidence data available from the Massachusetts Department of Public Health. These data indicated that causal relationships cannot be determined at this time. A review of the 1999 *Report to the Mayor, Health of Boston* prepared by the Boston Public Health Commission leads to a similar conclusion. In addition, Massport has shared the results of the *Soot Deposition Study* with public health agencies and is cooperating with the Harvard School of Public Health on the *South Boston Particle Source Apportionment Study.* Information on public health issues is provided in Chapter 6 of the Supplemental DEIS/FEIR. No alternatives violate the NAAQS. The Preferred Alternative shows better air quality results than the other alternatives.

Code	Topic 1	Topic 2	Comment	Response
T2.31.1	Alternatives	Runway 14/32	[A]t the very beginning of the hearing Mr. Saltmarsh [Chairman of the Massachusetts Aeronautics Commission] ...was touting the advantages of having the runway because it would send more flights over the water, but in fact, the runway, the flights that go over the water would impact ...[many residential areas including] East Boston...the seaport district...the housing that's along the waterfront now, and the new housing that's being proposed including that being proposed by Massport Authority... And at the other end, it would send three times as many flights over very populated neighborhoods beginning in East Boston's Eagle Hill, and then on to Chelsea, Everett, Malden, Somerville, and so on. So the advantages of the runway sending flights over the water are not advantages at all for people who live under those other flight tracks.	The goals of the Airside Project are to reduce delay, increase the airport's efficiency, and improve airfield safety in an environmentally responsible manner. Unidirectional Runway 14/32 would also give the controllers considerably more flexibility and allow them to improve achievement of PRAS goals, and redirect many flights to overwater routes. During very high demand periods, the controllers currently have little or no flexibility for runway selection. The addition of Runway 14/32 would be the single most important mechanism to achieve equitable geographic distribution of aircraft operations. Massport and the FAA are committed to the PRAS system and have been making improvements since 1982.
T2.31.2	Noise	Model	This representation of data to substantiate a certain point of view is found throughout the EIR...As an example, in Jeffrey's Point with takeoffs on the new runway 14, the day-night contours in, the EIR show that the noise level would not reach 60, but yet in another table called [T]imes [A]bove [N]oises [L]evels, the information contradicts those figures. The [T]imes [A]bove [N]oise [L]evel in the appendix show there would be an increase to the 65 DB threshold under option.	There is no contradiction between the tables of Day-Night Sound Level (DNL) values at the noise monitoring sites and the Time Above (TA) threshold values. The graphics in Appendix L of the Airside Project Draft EIS/EIR and the new graphics in the Supplemental DEIS/FEIR (for example Figures 6.2-7 and 6.2-8 showing exposure levels for the 29M Low and 37.5M High fleets) indicate that both sensor sites (Sites 14 and A, respectively) are properly situated on or between the 60 and 65 DNL contours, their locations accurately matching the tabular values of DNL listed in Tables 6.2-8 and 6.2-10 of Supplemental DEIS/FEIR. Comparable comparisons also exist between the noise contours of Figure 6.2-12 and Table 6.2-26 for the 2015 High Regional Jet Fleet. However, the commentor appears to be confused over the difference between the DNL and Time Above noise metrics. The time-varying sound level of a passing aircraft can rise to a numeric value that exceeds a threshold of say 65 dB, then fall back below that threshold and in so doing will add several seconds to the Time Above noise metric. Yet that threshold exceedance does not mean the DNL value (a cumulative measure of exposure for a full 24-hour period) will be greater than 65 dB. Readers unfamiliar with these technical issues should refer to Section 5.2.3 of the DEIS/EIR, *Appendix G of the Logan Airport 1998 Annual Update,* or Airside Project Draft EIS/EIR E of this document for background explanations of the noise metrics used in this evaluation.

T2.37.1	Alternatives	Runway 14/32	I don't understand why Massport can't understand that in order to build this runway, you need to expand into our neighborhoods [to rebuild the existing cargo facilities that would be demolished to build the runway]. That's a point that needs to be made. There's no more room to go...Go elsewhere. Go to Hanscom, go to Worcester...	Logan Airport's real estate is admittedly less than the desirable size. Since the existing area cannot be expanded, Massport proposed the Airside Project and is investigating other redevelopments to maximize efficiency, including the North Cargo Area and Bird Island Flats. Runway 14/32 will be located on fill that was prepared for this purpose 25 years ago. The runway will not increase airfield capacity, but will dramatically reduce aircraft and passenger delays during northwest wind conditions. Refer to Chapter 2 for a full analysis of the regional airports.

T2.39.1	Environmental Justice	Cumulative Impacts	Environmental justice is something that should be considered.	The Supplemental DEIS/FEIR provides a detailed Environmental Justice discussion in the airport context. The Environmental Justice analysis was significantly expanded in Section 6.8 of the Supplemental DEIS/FEIR. Low-income and minority populations were defined in accordance with Federal Executive Order 12898, the U.S. DOT Final Order, and the Council on Environmental Quality's guidance on Environmental Justice. In addition, the analysis of low-income populations was expanded to include households at 150 percent of poverty level. This analysis found that there is no high and adverse disproportionate impact to low-income and minority populations from the Preferred Alternative. TEST Adverse impacts are not predominately borne by low-income or minority populations. Only 21 percent of the population within the 65 dB DNL contour for the Preferred Alternative is minority, compared to the Suffolk County minority population of 38 percent. Less than two percent of the population within the 65 dB DNL contour for the Preferred Alternative has a household income less than 150 percent of poverty level. The additional area within the 65 dB DNL noise contour associated with the Preferred Alternative includes a predominately Hispanic neighborhood in Chelsea which is predicted under worst case assumptions to experience an increase of 0.6 dB or less. Under FAA standards, this change is not a significant adverse impact. Mitigation of the increased noise within the 65 dB DNL noise contour will be provided to affected communities in the form of residential sound insulation.
T2.39.2	Regional Transportation	Regional Airports	A second airport bearing one-half of the burden we've been bearing for years is something which should be considered and which the agency should be pushing for.	Because the development of a second major airport would require ten to 15 years for site selection and environmental review in addition to a multi-year construction period, this option is not viewed as a solution to accommodating forecast demand over the next 20 years. Service developments at other surrounding airports, including Manchester, T.F. Green/Providence and Worcester Regional airports, preclude the need for a second major airport.
T2.39.3	Alternatives	Runway 14/32	[O]ne last thing is they keep talking about the runway bringing the flights out over the water…If you're taking off over the water, it's because the wind is blowing off the water into our neighborhoods, so when those jets are taking off, the roar of the sound is being carried by the wind even more into our neighborhoods and the fumes are being carried off the water into our neighborhoods, so saying they're going over the water is not doing us any justice because we're still getting the same amount of pollution and noise.	The goals of the Airside Project are to reduce delay, increase the airport's efficiency, and improve airfield safety in an environmentally responsible manner. Unidirectional Runway 14/32 would also give the controllers considerably more flexibility and allow them to improve achievement of PRAS goals, and redirect many flights to overwater routes. During very high demand periods, the controllers currently have little or no flexibility for runway selection. The addition of Runway 14/32 would be the single most important mechanism to achieve equitable geographic distribution of aircraft operations. Massport and the FAA are committed to the PRAS system and have been making improvements since 1982.

T2.40.1	Regional Transportation	Regional Airports	In Volume 1 on Page 2-9, they show a map of all the commercial [airports]...Hanscom is not there.	Hanscom Field was not listed in Figure 2.3-2 on page 2-9 of the Draft EIS/EIR as a commercial service airport, because the Figure only listed airports that have supported scheduled commercial passenger jet services. The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR specifically considered the role of Hanscom Field in the analysis of regional alternatives. Hanscom Field, which serves as a general aviation reliever airport to Logan Airport, already accommodates a significant number of aircraft operations (183,000 operations in 1998). The Hanscom Field activity includes private, business, charter, and air taxi operations that might otherwise use Logan Airport. Since the Airside Project Draft EIS/EIR was filed, Shuttle America, a newly founded airline, began commercial scheduled operations at Hanscom Field, offering limited turboprop services to short-haul regional markets – Trenton, Buffalo, Hartford (discontinued), Wilmington, Delaware (discontinued), and Greensboro. Shuttle America is also conducting operations between Hanscom and New York LaGuardia Airport. While Massport supports commercial service at Hanscom Field consistent with its established policy (60-seat regulation), it believes that Hanscom Field will maintain its role as a major general aviation reliever, and that its geographic proximity to Logan, Worcester Regional and Manchester airports will prevent its development as a significant commercial airport. Additionally, commuter airlines serving Logan Airport are unlikely to move a significant number of flights from Logan Airport to Hanscom Field, since approximately 50 percent of passengers on Logan Airport's commuter flights connect to other Logan Airport flights. However, any new commercial service initiatives proposed for Hanscom Field shall be reviewed for consistency with the *Hanscom GEIR* (HGEIR), its Annual Updates, and applicable regulatory limitations, and shall be considered by the Hanscom Field Advisory Committee. Refer to Section 2.6 of the Supplemental DEIS/FEIR for a discussion of Hanscom Field. The environmental impacts of commercial services at Hanscom Field are summarized from the HGEIR and appear in Airside Project Draft EIS/EIR B of the Supplemental DEIS/FEIR.
T2.40.2	Environmental Review Process	MEPA/NEPA	[In] Volume 3 on Page 4, ...the graph shows Saratoga Street as the last street before the water...There are two streets after Saratoga Street towards the water, St. Andrew Road and Bays Water Street.	Refer to the new graphics in Chapters 4, 5 and 6 of the Supplemental DEIS/FEIR.

T2.43.1	Alternatives	Reduced Approach Minimums	I'm here...on behalf of my community who sits under the bad weather runways 4 and 22 which brings out the point of the lowering of the minimum which is, from what I understand, an FAA concern. Massport has presented this to us as a 94-hour gain...Your 94 hours relates approximately to 3,000 flights in inclement weather...We have asked over and over that you look at the Beachmont Hill again. We are sure that all of you understand that this hill has a school on the top of it. This is not reflected in your report. The pictures still show it without the 50-foot school on it. When you are flying above our heads 500 feet, 50 feet makes a big difference.	The Supplemental DEIS/FEIR indicates that the Preferred Alternative would promote runway use in a manner that is more consistent with annual PRAS goals. The PRAS goals were established after community input in the 1980s. The goal of PRAS was to distribute noise equitably, based on demographic considerations.
T2.43.2	Noise	Hushkitted Aircraft	In your report, you address noise mitigation stage 3. We find this inadequate. We find that our main concern is excessive traffic and excessive noise. To be exact, 104 decibels. During a day when I received your noise abatement follow-up, we can see that we're at 75, mostly in the 80s, lots in the 90s, and a few in the hundreds. That's excessive and intolerable. For you to mitigate with us with the Stage 3 aircraft is absolutely ludicrous. Stage 3, I believe you are currently flying at 85 percent...Those still wake me up at night when you're flying only stage 3 at 10 p.m...Please...find another way that your airplanes will be no louder than 65 decibels. That would be a true mitigation.	Massport's initial efforts have been to focus discussion with Logan Airport carriers to encourage substitution of full Stage 3 certified aircraft for hushkitted aircraft where feasible. Both the Supplemental DEIS/FEIR and the *Logan Airport 1999 ESPR* (previously GEIR) discuss the status of and potential for reducing the use of hushkitted Stage 3 aircraft. Refer to Section 8.4 of the Supplemental DEIS/FEIR.
T2.43.3	Noise	Impacts	[W]e find your report inadequate that you've only addressed [noise] in short term. The long term, your growth, far outweighs anything that we might gain in the short term in our community.	Current traffic trends at Logan Airport and the regional airports indicate that Logan Airport may not reach 29 million passengers, presented in the Draft EIS/EIR as a "1999" projection, until 2003. Continued air service expansion at the regional airports and the introduction of high-speed rail to New York in December 2000 is expected to further slow Logan Airport's passenger traffic growth. With these developments, Logan Airport is expected to reach 37.5 million passengers in 2015 rather than 2010, and the 45 million passenger forecasts will not be achieved until 2024. Thus, the planning forecasts that underlie the delays and environmental analyses cover a planning period of at least 20 years. Refer to Section 4.2 of the Supplemental DEIS/FEIR for a complete discussion of the planning forecasts.

T2.45.1	Public Health	Effects	What's happening in Winthrop is we're being impacted by the air pollution from the airport, and we've also been excluded from any real scientific studies of that impact.	No alternatives violate the NAAQS. The Preferred Alternative shows better air quality results than the other alternatives.
T2.45.2	Regional Transportation	Regional Airports	Massport has not spent a single nickel on promoting the regional airport aspect.	The analysis of regional alternatives presented in the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR relies on air to high-speed rail diversion estimates published in the Supplemental DEIS/FEIR and Section 4(f) Statement, Northeast Corridor Improvement Project, prepared by the Federal Rail Administration in October 1994. In preparing the Supplemental DEIS/FEIR, Massport contacted Amtrak for more recent estimates, but Amtrak did not have any updated ridership estimates that could be released to Massport. Amtrak's written response to Massport's request for updated ridership numbers is contained in Airside Project Draft EIS/EIR B of the Supplemental DEIS/FEIR.

T2.46.1	Noise	Impacts	The pollution and the noise resulting from thousands of increased jet aircraft operations promises to increase intolerable living conditions.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR analyze the environmental impacts of the Airside Project, consistent with established federal and state scoping directives. Appropriate mitigation associated with the Airside Project has also been established. Massport has programs in place to reduce the environmental impacts associated with Logan Airport as a whole. These initiatives are described in the *Logan Airport ESPR* and its updates.
T2.46.2	Purpose and Need	Delay	Massport claims that building 14/32 would reduce Logan congestion. That statement merely reflects one of the many dishonest assessments Massport is promoting.	Based on simulation modeling, Logan Airport experienced 120,000 hours of runway-related delays in 1998. If no actions are taken, runway-related delays are forecast to grow as high as 333,000 hours under a 37.5M High Fleet scenario. The Preferred Alternative produces immediate and long-term benefits by lowering runway delays by 38,000 hours if it had been in place in 1998, and by as much as 94,000 hours in the future 37.5M High Fleet scenario. Because of the impact of the regional alternatives, the 37.5M High Fleet scenario is not expected to be achieved until 2015. The sooner airside efficiencies are implemented; the more benefits will accrue over time. Section 4.6 of the Supplemental DEIS/FEIR shows that delay reduction benefits increase over time as traffic levels increase.

T2.47.1	Public Health	Effects	[E]nvironmentally I believe that a whole lot more studies need to be done to find out how traffic that we have at the airport now is affecting the people and the residents in the surrounding communities.	The purpose of the Airside Improvements Planning Project is to reduce current and projected levels of airfield congestion and delay and to enhance the safety of aircraft operations at Logan. Massport's proposed landside improvements are planned to enhance the efficiency of passenger processing, and include terminal modernization, as well as roadway, parking and service area improvements. The landside projects will not affect the design or implementation of the Airside Project, which has independent utility, nor will the Airside Project improvements affect the design or implementation of any of the landside projects. All airside and landside projects, where required, will continue to be the subject of separate comprehensive environmental analysis by project proponents in accordance with federal and state regulations. As expressed in the May 7, 1999 EOEA Certificate, Massport's Environmental Planning and Status Report (ESPR, formerly GEIR) process "is expected provide a big picture cumulative impact analysis of Logan operations, impacts and mitigation. It complements the project-specific EIRs," such as this one for the Airside Improvements, "helps to focus the review process of individual EIRs, and ensures that segmented project review does not occur in the context of MEPA review at Logan Airport."

Code	Topic 1	Topic 2	Comment	Response
T2.48.1	Noise	Impacts	The residents of East Boston and all the surrounding communities today suffer an unacceptable level of noise and air pollution.	PRAS noise goals are based on the fact that DNL levels above 75 dB are considered unacceptable for residential land use and that DNL levels above 70 dB are also excessively high and should be reduced if feasible. PRAS recommendations are thus designed to shift operations off of runways where these high levels still exist – primarily in Winthrop and to the north of Logan Airport in East Boston and Revere. No one in Chelsea or Charlestown currently experiences noise that is this high.

T2.48.2	Regional Transportation	Regional Airports	Massport...should maximize the use of airports in Rhode Island, New Hampshire, Bedford, Worcester, and New Bedford...[Massport should] build a new major New England International regional airport at Fort Devens.	A second major airport is not a solution to the current delay and congestion problems at Logan Airport. The Proposed Project to reduce delay and enhance safety at Logan Airport must be implemented in the near term to address current and future operating conditions. Even if a second major airport were to be pursued, the planning period for site selection and environmental review would require ten to 15 years, in addition to a multi-year construction period. Rather, Logan Airport is part of a regional system of airports that includes the T.F. Green/Providence, the Manchester, and the Worcester Regional airports. Service development and increased passenger traffic at these airports are an important part of the region's long-term strategy to accommodate passenger and activity growth. Greater use of the regional airports will provide passengers within the service area of such airports with a viable alternative to Logan Airport. Since demand within Logan Airport's primary service area will remain strong, the improvements at other regional airports will not eliminate the need for airside projects at Logan Airport. The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR, specifically considered the role of Hanscom Field in the analysis of regional alternatives. Hanscom Field, which serves as a general aviation reliever airport to Logan Airport, already accommodates a significant number of aircraft operations (183,000 operations in 1998). The Hanscom Field activity includes private, business, charter, and air taxi operations that might otherwise use Logan Airport. Since the Airside Project Draft EIS/EIR was filed, Shuttle America, a newly founded airline, began commercial scheduled operations at Hanscom Field, offering limited turboprop services to short-haul regional markets – Trenton, Buffalo, Hartford (discontinued), Wilmington, Delaware (discontinued), and Greensboro. Shuttle America is also conducting operations between Hanscom and New York LaGuardia Airport. While Massport supports commercial service at Hanscom Field consistent with its established limits (60 seat regulation), Massport believes that Hanscom Field will maintain its role as a major general aviation reliever, and that its geographic proximity to Logan, Worcester Regional and Manchester airports will prevent its development as a significant commercial airport. Additionally, commuter airlines serving Logan Airport are unlikely to move a significant number of flights from Logan Airport to Hanscom Field, since approximately 50 percent of passengers on Logan Airport's commuter flights connect to other Logan Airport flights and a significant number of passengers are travelling to Boston. However, any new commercial service initiatives proposed for Hanscom Field shall be reviewed for consistency with the *Hanscom GEIR* (HGEIR) and its Annual Updates, and shall be considered by the Hanscom Area Town Selectmen (HATS). Refer to Section 2.6 of the Supplemental DEIS/FEIR for a discussion of Hanscom Field. Fort Devens was an alternative considered as a potential airport site in the Second Major Airport Site Selection study conducted in 1991 by the Massachusetts Aeronautics Commission. However, Fort Devens was not selected. The site has since been developed for other uses. Development at T.F. Green/Providence, Worcester Regional and Pease International Tradeport has superseded the need for a second major airport.

T2.50.1	Purpose and Need	Delays	If the flights are late arriving at Logan, it is not 14/32 that has to be built. The FAA has failed at a national level to look at the points of origin of those delays. That is a poor, lame, ignorant excuse and contention to build 14/32.	The Airside Project addresses delays from constraints at Logan Airport. Section 1.6 and Appendix C of the Supplemental DEIS/FEIR also contains a detailed discussion of the FAA and U.S. DOT delay measures and historical data, along with comparisons of Logan Airport delays within the context of delays at other United States airports.
T2.50.2	Environmental Justice	Impacts	This is a class issue. This is an environmental injustice. It's social injustice.	Low income and minority populations were defined in accordance with Federal Executive Order 12898, the U.S. DOT Final Order and the Council on Environmental Quality's guidance on environmental justice. In addition, the analysis of low-income populations was expanded to include households at 150 percent of poverty level. The data presented are based on the most recently available census data (1990) using Geographic Information System (GIS) technology to analyze impacts at the most detailed level possible. Refer to Section 6.8 of the Supplemental DEIS/FEIR for a discussion of the analytical methodology and results, respectively.
T2.50.3	Alternatives	Runway 14/32	[H]ow does Massport propose to build a new runway and [claim] it won't further pollute East Boston and the surrounding communities?	Emissions are shown to decrease with the Preferred Alternative when compared to the No Action Alternative. No alternatives violate the NAAQS. The Preferred Alternative shows better air quality results than the other alternatives.

T2.52.1	Environmental Justice	Impacts	It's the hundreds of thousands of people in the city of Boston and surrounding areas that this project would affect, it's the environmental injustice that's being done to these people, to this city.	Adverse impacts are not predominately borne by low-income or minority populations. Only 21 percent of the population within the 65 dB DNL contour for the Preferred Alternative is minority, compared to the Suffolk County minority population of 38 percent. Less than two percent of the population within the 65 dB DNL contour for the Preferred Alternative has a household income less than 150 percent of poverty level. The additional area within the 65 dB DNL noise contour associated with the Preferred Alternative includes a predominately Hispanic neighborhood in Chelsea which is predicted under worst case assumptions to experience an increase of 0.6 dB or less. Under FAA standards, this change is not a significant adverse impact. The minority and low-income populations in South Boston and East Boston affected by the Preferred Alternative 65 dB DNL contour are almost identical to the No Action Alternative. The 65 dB DNL contour for the Preferred Alternative does not extend into Jamaica Plain, Roxbury and the South End. Mitigation of the increased noise within the 65 dB DNL contour will be provided to affected communities in the form of residential sound insulation.
T2.52.2	Regional Transportation	Regional Airports	We would like to work on working out a plan for the entire northeast, how to develop it regionally with all the airports, with all the alternatives in transportation, and it's not just airports, it's the rail, it's high-speed anything else that can be done, and the roadways and everything has to be looked at together.	Chapter 2 of the Supplemental DEIS/FEIR provides a discussion of the specific role played by the regional transportation alternatives and steps that Massport has taken to foster use of these alternatives. Massport has long recognized and has been a proponent of options to Logan Airport. Together with the regional airports, Massport has implemented a regional strategy to enhance the use of options to Logan Airport. In the Draft EIS/EIR, Massport identified up to 7.3 million annual passengers that could be absorbed by regional alternatives that include use of T.F. Green/Providence, Manchester and Worcester Regional airports, as well as the new high-speed rail to New York. In the Supplemental DEIS/FEIR, Massport recognizes that these developments will slow Logan Airport's passenger traffic growth. Logan Airport may not achieve the 37.5 million passenger forecasts until after 2010, but rather closer to 2015, and the 45 million passenger forecasts may not be achieved until after 2020. While regional alternatives can play an important role in reducing the rate of future traffic growth at Logan Airport, they do not address Logan Airport's inability to efficiently accommodate current levels of demand during northwest wind conditions. Runway 14/32, which is designed to correct the problem with Logan Airport's layout, is necessary to correct this deficiency and provides clear benefits at current aircraft traffic levels. These benefits will only increase in the future, even as developments at the regional airports act to reduce the rate of future growth at Logan Airport.

Code	Topic 1	Topic 2	Comment	Response
T2.52.3	Alternatives	Runway 14/32	All this project is doing in putting more runways and more planes…[is] bring[ing] much more…air pollution and traffic pollution in our neighborhoods.	The proposed Airside Project will not stimulate additional growth in passenger activity levels at Logan Airport. Off-site motor vehicle emissions estimates are shown in Table 6.4-9 of the Supplemental DEIS/FEIR. Increases in the number of vehicles accessing Logan Airport are not analogous to increases in emissions. As indicated in the table, these emissions generally decrease in the future; as a result of improved motor vehicle emission standards, the increased use of alternative fuels, and other factors.

Code	Topic 1	Topic 2	Comment	Response
T2.53.1	Alternatives	Runway 14/32	[T]his [airport expansion] is going to create more pollution, increase more noise, and create more traffic.	The Preferred Alternative, and specifically unidirectional Runway 14/32, would not increase Logan Airport's normal airfield capacity of approximately 120 operations per hour. This capacity is available at Logan Airport approximately 80 percent of the time. Runway 14/32 would allow Logan Airport to maintain this capacity during periods of strong northwest winds that now require controllers to operate on only one or two runways, compared to the typical three-runway configurations used at Logan Airport. The runway will not increase Logan Airport's normal operating capacity, nor will it encourage or induce an increase in aircraft operations. No alternatives violate the NAAQS. The Preferred Alternative shows better air quality results than the other alternatives. Implementation of Runway 14/32 would not result in substantial noise impacts in any community. Rather, it would enable the air traffic controllers to adhere more closely to the PRAS goals and decrease the population that is most severely affected. For example, implementation of the Preferred Alternative will reduce the population affected by Day-Night Sound Level values greater than 70 dB by four percent with the 29 M Low Fleet scenario, by 67 percent with the 37.5 M High Fleet scenario, and by 39 percent with the High Regional Jet Fleet, while increasing the population exposed to Day-Night Sound Level values greater than 65 dB by two percent, zero percent, and three percent for these three fleet scenarios, respectively. Refer to Section 6.2 of the Supplemental DEIS/FEIR and population counts presented in Tables 6.2-3 through 6.2-8 of the Supplemental DEIS/FEIR.
T2.53.2	Purpose and Need	Economic	[T]he only economics behind this [project] is to create more business for big business.	The benefits of Runway 14/32 are significant: (1) It provides a third runway for operations during northwest winds; (2) it reduces total annual delay by 27 to 37 percent (Preferred Alternative vs. the No Action Alternative); (3) it reduces delays during VFR conditions by 47 to 57 percent (Preferred Alternative vs. the No Action Alternative); (4) it allows controllers to separate aircraft of differing size classes during northwest winds; and (5) it increases the controllers' ability to achieve PRAS goals.

Code	Topic 1	Topic 2	Comment	Response
T2.56.1	Noise	Model	I'd like to mention one of the many of Massport data's statistical...omission[s]...[The table in the DEIR/DEIS titled] Noise Exposure Population by Community, [lists] several communities, and it has Chelsea listed as zero noise exposure population...[T]he data that they're using is flawed, there are things missing, it's manipulated.	Tables 6.2-4 and 6.2-5 show the noise exposed population for Chelsea for the 29M Low and 37.5M High Fleet scenarios, respectively. Although both show no noise exposed population in DNL 70 dB and above, both show noise exposed population in the DNL 65 dB and DNL 60 dB and above categories.
T2.56.2	Alternatives	Other Non-Construction Alternatives	But do they put anything in the study about alternatives that do not pollute such as improving the air traffic controllers' electronics which would improve safety, efficiency, and does not pollute at all?	The goals of the Airside Project are to reduce delay, increase airport efficiency and improve airfield safety in an environmentally responsible manner. They do not reflect an "airport-wide growth and expansion plan", nor increase the capacity of the airport. Future passenger and operations levels can be accommodated by Logan Airport without any airside improvements but not without delays and resulting adverse environmental impacts. Long-term aviation growth is a recognized worldwide condition that is beyond Massport's control, which means that the sooner the airfield efficiencies are implemented, the more benefits they will accrue over the future.
T2.56.3	Alternatives	Other Non-Construction Alternatives	Do they talk about studies that they must have done about other airports that have similar delays?	Delays occur when wind or weather conditions require the use of configurations with fewer than three active runways, when poor weather requires increased separation distances between aircraft, or when airlines schedule more flights than Logan Airport can handle. The Airside Project is designed to reduce delays at Logan Airport from adverse winds and taxiway congestion. The Airside Project addresses delays from constraints at Logan Airport. Section 1.4 and Appendix C of the Supplemental DEIS/FEIR also contains a detailed discussion of the FAA and U.S. DOT delay measures and historical data, along with comparisons of Logan Airport delays within the context of delays at other United States airports.

T2.57.1	Noise	Sound Insulation	The acoustical treatment as soundproofing should really be known as is restricted to 65 decibel yearly average but only to homes that are up to building codes, and they do not provide air conditioning. Try to live inside a house when it's a very hot, humid day, try not to think about that when you want to use your backyard and you can't because you can't acoustically treat your backyard.	The average noise of Stage 3 aircraft operating at Logan Airport is expected to decrease with time as the low bypass JT8D powered aircraft, which have been hushkitted to meet Stage 3 requirements, are retired from the fleet and replaced by the quieter new high bypass powered Stage 3 aircraft.

T2.61.1	Environmental Review Process	Public Process	I really don't understand how we can...participate in the environmental process through MEPA when we [in Quincy] have not had a presentation [from Massport]...[W]e're going to demand that we get a presentation or it's going to be a flawed process.	There was an extensive public participation and review process during the preparation of the Draft EIS/EIR. Public comments were received on the ENF after it was filed during the summer of 1995. In the fall of 1995, several public scoping sessions were held to provide community input to the subsequent state and federal scopes for the project. To assure that the Airside analysis was conducted with awareness and input from all concerned parties, the Massport Board established the Airside Review Committee (ARC), which consists of the Community Advisory Committee (with representatives from 24 communities surrounding Logan Airport), and 11 businesses and industry organizations. Massport also funded independent consultants for the CAC to provide them with the capacity to professionally assess the analysis and conclusions of the Airside Study. Between 1995 and 1999, Massport held 16 meetings with the ARC, an additional 15 meetings with just the CAC, and several meetings with the CAC consultants. In addition, Massport made 29 presentations to elected officials, most of whom represent Logan Airport's neighboring communities, and Massport held 45 meetings with community and business leaders, reaching an audience of more than 3,000 people. During the public comment period on the Draft EIS/EIR, the FAA held two public hearings. In January 2000, in response to the FAA's review of the Draft EIS, the FAA called for preparation of a Supplemental Draft EIS to address specific issues identified by the FAA following input from a SDEIS Panel consisting of six persons. At the FAA's direction, three SDEIS Panel members were appointed by the Governor of the Commonwealth of Massachusetts and three were appointed by the Mayor of the City of Boston. Under the direction of the New England Region FAA, the SDEIS Panel convened in March of 2000 and then met at least monthly with a final meeting in December of 2000. A total of 12 meetings were held. To provide the appropriate background, the SDEIS Panel was presented with an Interim Supplemental Draft EIS, the Draft EIS/EIR, answers to key letters written by members of the public, concerned agencies and public officials responding to the Draft EIS/EIR, and a series of 15 visual and written presentations from the Project's technical consulting team and other independent industry experts.
